The Canadian Engineer

Published Weekly — Established 1893

A Weekly Paper for Civil Engineers and Contractors

Including chiefly municipal, railroad, hydraulic,
structural, highway and consulting engineers;
surveyors; mine managers; contractors;
and water works superintendents

182686.

23.7.23.

Index to Volume 42

January 1 to June 30, 1922

Published every Tuesday by The MONETARY TIMES PRINTING CO. OF CANADA, LIMITED

HEAD OFFICE: CORNER CHURCH AND COURT STREETS, TORONTO, ONTARIO

Telephone Main 7404, Branch Exchange connecting all Departments

Cable Address: "Engineer, Toronto"

WESTERN CANADA OFFICE: 1206 McArthur Building, Winnipeg

The Canadian Engineer

INDEX TO VOLUME 42

January 1 to June 30, 1922

- A**
- A.A.A.S.—Correspondence in Report of Meeting of Engineering Section. 132.
A.A.A.S. Discusses Many Topics—Engineering Section. 109.
Abitibi River—Power Allotted on. 500.
Accident at Hydro Power Plant. 429.
Accounting—Highway; G. F. Pineo. 407.
Act for Alberta—New Highways. 328.
Act, Province of Ontario—Engineering Professions*. 621.
Activated Sludge Plant at Brampton, Ontario*; W. M. Treadgold. 459.
Acts—Highway Drainage and the Application of Drainage; U. W. Christie. 309.
Adams, Dr. Frank D. (Personal). 638.
Adams, Thomas (Personal). 275.
Adams, W. G. A. (Personal). 390.
Aerial Photography*; P. J. Barry. 195.
Aerials—Efficiency of Transmission. 500.
Aesthetic Standards for Bridges†. 615.
African Project—B.C. Engineers Work on. 133.
Aggregate in Bituminous Macadam Roads—Local Mineral; Major W. A. Welch. 449.
Aggregates for Asphalt Pavements—Standardized Specifications for Mineral; Roy M. Green. 498.
Aid, Its Implications and Results—Federal*; A. W. Campbell. 649.
Aitoli, William*. 481.
Air—Lift Pumping—Experiments on. 256.
Alberta—New Highways Act for. 328.
Alberta Professional Engineers Meet. 384.
Alberta Road Districts Mapped Out. 500.
Alberta—Road Work Opening up in. 505.
Alexander, W. A. (Personal). 405.
Alkali on Concrete—Testing Effect of. 215.
Alkali Problem—Calgary Conference on. 586.
Alkali Solts—Review of Investigation into Deterioration of Concrete in. 209.
Allen, E. Blake; Toronto Highway Entrance Bridges, at Hamilton*. 397.
Allen, James; Portland Cement Concrete Roads. 629.
Allen, Thomas C.* 511.
Alwood, F. W.; Substructure, Johnson St. Bridge, Victoria, B.C.*. 577.
Aluminium Sulphate—Treatment of Hard, Impure Water With; William Goss. 619.
Amendment to Engineering Institute By-Laws and Cons. Res. 332.
American Concrete Institute Convention. 133.
American Good Roads Congress—Program. 114.
American Good Roads Convention. 135.
American Metric Association Meet in Toronto. 113.
American Society for Testing Materials. 379.
American Water Works Association. 422.
American Water Works Association—Annual Meeting of Canadian Section of. 501.
American Water Works Association—Nominations. 50.
American Water Works Association—Philadelphia Convention. 485.
Aqueduct Underdrainage—Winnipeg. 452.
Arch Bridge—Winnipeg—Maryland Street Concrete*. J. F. Greene. 339.
Arch—Unexpected Test of an. 114.
Arches—Stresses in Skew†. 523.
Architects and Foreign Materials*; W. E. Ramsey. 212.
Architects Annual Meeting—Manitoba Association of. 195.
Artes—Creation of Urban†. 594.
Armstrong, William H.* 390.
Artery at Ottawa—Diagonal Traffic†. 618.
Asphalt Pavement Yardage—Increase in. 461.
Asphalt Plant at Catharines, Ont., Municipal*. W. P. Near. 279.
Assessment for Benefit, K. W. McKay. 341.
Associated Manufacturers of Water Purifying Equipment. 174.
Astoria—Mechanical Engineers Meet in. 450.
Austin, R. de Bruno; Beach Water Works Pumping Plant at Hamilton*. 462.
Auto—Educator—Ottawa*. 268.
Auto Tires—Greer Lane in. 657.
Automatic Train Control—Extension off. 570.
A.W.W.A. Brantford Meeting—Canadian Section. 442.
A.W.W.A. Meeting—Canadian Section. 427.
- B**
- Baker, G. H.; Water Works System at Richmond Hill, Ont.*. 437.
Baldwin, A. L. (Personal). 390.
Banting, E. W.*. 369.
Banwell, J. E. (Personal). 370.
Barnes, A. S. L.; Libraries for Research Workers*. 294.
Barnes, A. S. L.*. 321.
Barr, Wm. M.; Water Softening as a Factor in Municipal Supply. 402.
Barron, R. E. N. (Personal). 333.
Barry, P. J.; Aerial Photography*. 195.
Barry, P. J.; Claim to be Valid Must be Proved*. 450.
Base Lines as an Aid to the Engineer—Establishing of Plant*; J. LeRoy Underhill. 490.
Bateman, John H.; Controlling Quality of Materials in Highway Construction. 621.
Bathurst, N.B.—Hydro-Electric Developments Near*; James Dick. 151.
Battacan River, Que.—New Highway Bridge Over*; Edward Holgate. 487.
B.C. Engineers Work on African Project. 133.
B.C. Forest Products Bureau. 648.
Beach Water Works Pumping Plant at Hamilton*; C. D. Thomas. 563.
Beach Water Works Pumping Plant at Hamilton*; R. De Bruno-Austin. 462.
Bean, L. H.; January Index Numbers*. 313.
Beardmore-Tol Engine Test. 690.
Beattie, Adam*. 138.
Beatty, Harvey (Personal). 333.
Bell, Fred C. (Personal). 370.
Bell, Herbert D.; The Maintenance of Clean Filtering Medium in Sewage Filters. 150.
Bell, James A. (Personal). 481.
Berg, Anton*. 198.
Biegs, Hon. F. C.; Good Roads System in Ontario. 327.
Blodeau, Ignace*. 370.
Bliehoff, W. H. (Personal). 616.
Bituminous Foundations, Street and Road Pavements; Hugh W. Skidmore C.E. 247.
Bituminous Gravel and Sand Roads—Preparing; W. D. Sohler. 206.
Bituminous Macadam Roads—Local Mineral Aggregate in; Major W. A. Welch. 449.
Bituminous Pavements—Plant Inspection to Insure Good; Francis P. Smith. 691.
Bituminous Spraying Company of Canada—The p. 48.
Bituminous Surfaces on Gravel Roads; Paul D. Sargent. 506.
Bituminous Treatments on Macadam Roads; Alan P. Hay. 355.
Blanchard, Arthur H.; The Railroad as an Operator of Highway Transport. 561.
Board of Health—Valuable Work of the Ontario†. 537.
Board of Trade Building, Toronto—Alterations to Old. 235.
Bond, Wm.*. 260.
Bonds—Surety Companies and Contractors; W. H. Hall. 192.
Books Reviewed:
Columns, by E. H. Salmon. 569.
Design and Construction of Dams—The, by Edward Veinmann. 611.
Design of Steel Mill Buildings and the Calculation of the Stresses in Framed Structures, by Milo S. Ketchum, reviewed by C. H. Young. 330.
Fire Prevention and Fire Protection as applied to Building Construction, by Joseph Kendall Frettag.
Hydraulics of Pipe Lines, by Dr. W. F. Durand, reviewed by Thos. H. Hoge. 636.
Land Drainage, by W. L. Powers and T. A. Teator, reviewed by Douglas L. McLean. 410.
Manufacture of Portland Cement by Arthur C. Davis, reviewed by A. C. Taggo. 661.
Mechanical Testing, by R. G. Bateson and J. H. Hyde, reviewed by Peter Gillespie. 352.
Mineral Land Surveying, by James Underhill, reviewed by E. W. Banting. 369.
Sanitation and Sewage Disposal for Farmssteads and Country Estates, by William F. Gerhard, reviewed by Hector S. Phillips. 233.
Sewage Purification, by S. H. Adams, reviewed by Hector S. Phillips. 353.
Sewerage and Sewage Disposal, by Leonard Metcalf and Harrison P. Eddy, reviewed by R. O. Wynne-Roberts. 293.
Sewerage and Sewage Treatment, by Harold E. Babbitt, reviewed by Dr. George G. Nasmith. 479.
The Architects' and Builders' Hand Book. Data for Architects Structural Engineers, Contractors and Draughtsmen, by the late Frank E. Kidder, etc., reviewed by C. R. Young. 330.
Boone, Charles S.*. 412.
Borden, H. P. (Personal). 452, 538.
Bostock Hon. Hewitt W. (Personal). 238.
Bostock, Senator Hewitt W. (Personal). 153.
Boswell, Maitland C.; School of Engineering Research, University of Toronto. 609.
Bott, Edward*. 616.
Boulton, Sampson J.*. 616.
Boulanger Joe L. (Personal). 615.
Boundary Waters—Engineering Problems of. 313.
Bowley, Lt.-Col. H. L.; Economical Methods of Handling Material. 557.
Boyd, William B. (Personal). 624.
Boyden, Lieut.-Col. H. C. (Personal). 451.
Bracing of Buildings—Uncertainties Respecting Wind†. 370.
Bradfield, J. C. (Personal). 452.
Bradford, Eng.—Water Supply. 443.
Bradley, N. H. (Personal). 695.
Brampton, Ontario—Activated Sludge Plant at*; W. M. Treadgold. 459.
Breed, H. Eltinge; Importance of Surface Finish on Roads. 478.
Breithaupt, J. C. (Personal). 153.
Brian, M. E.; Intercepting Sewer in the Essex Border District*. 321.
Bridge at Leaside—May Build. 172.
Bridge Cables—Life of Wire†. 157.
Bridge, Calgary—Hillhurst*; John F. Greene. 489.
Bridge, Elora, Ont.—High Level Concrete*; A. W. Connor. 517.
Bridge Opened Over Sixteen Mile Creek—New Road*. T. D. Myrnes. 203.
Bridge Over Batiscan River, Que.—New Highway*; Edward Holgate. 487.
Bridge Over Sydney Harbor, New. 498.
Bridge Structures—Gunite Encasement of Steel†. 660.
Bridge—Substructure of Edmonton—Madevaska*; G. McN. Stewes. 645.
Bridge, Victoria, B.C.—Substructure, Johnson St.*; F. W. Alwood. 577.
Bridge—Weatherproofing Hudson River. 518.
Bridge, Winnipeg—Maryland Street Concrete Arch*. J. F. Greene. 339.
Brigand, M. P.; Developments in Photographic Surveying*. 359.
Bridges—Aesthetic Standards for†. 615.
Bridges and Culverts—Concrete; W. J. Moore. 629.
Bridges—Artistic Design of; Charles Evan Fowler. 511.
Bridges, at Hamilton—Toronto Highway Entrance*. E. Blake Allen. 397.
Bridges at the Perrot—Will Build. 264.
Bridges versus Tunnels†. 237.
British Firm Celebrates Centenary. 693.
British Firm Erects Hydro-Electric Dept. 527.
British Research in Ambigua. 425.
British Town Planning Convention. 420.

Effect of Cleaning Water Mains in Kansas City

Volume of Flow Restored to Capacity of New Pipe — Saving in Coal Consumption Almost Paid for Cost of Cleaning — Does Not Damage Pipe — Method of Testing Mains Described — Cost of Operation

BY CHARLES S. FOREMAN

First Asst. Engineer, Kansas City Water Dept.

WATER works engineers and superintendents usually know the necessity of cleaning certain water or feeder mains in the system which they may be operating but before they are able to obtain authorization and appropriations to cover such work, they are called upon to answer many questions which may be put to them by a Board of Commissioners.

The author believes that the publication of his experience in water main cleaning in Kansas City during the past three years will be of value to other water works superintendents desirous of instituting similar work in the system under their jurisdiction, and that knowledge of the following essential facts, based upon his experiences, will help them to answer some of the questions which are usually asked.

1. That the cleaning can be so arranged that a main need not be out of service longer than 12 hours.
2. That the cleaning process is not injurious to the main.
3. That an increase in carrying capacity of from 60 per cent to 85 per cent was obtained in large mains and that the carrying capacity of such mains was restored to that of new pipe.
4. That the saving in coal costs alone, derived from cleaning will pay the entire costs of cleaning within from one to three years.
5. That the laying of additional mains to obtain increased capacity can be postponed until the consumption demands are equal to the maximum capacity of the old main on the basis of new pipe.
6. That when taking as credits, such items as coal

lines, 2 in. pipe was connected to each of these taps and Baltimore, a distance of approximately 6,000 ft., for determining the interior condition and carrying capacity of this pipe; the pipe having been laid in 1886. The tests were made by making taps exactly 1,000 ft. apart upon a straight length of the main, there being no services or connections to the main between gauging points. At each of these points 1 inch corporation cocks were installed for inserting pitometers and additional corporation cocks for pressure 1,000 ft. of this pipe laid along the surface of the ground bringing the two together so that a U tube could be connected in to measure the differential pressure between the two points. The 30 in. pipe was double traversed at each pit and the average traverse coefficient obtained. A pitometer was then set at each pit for checking quantities flowing through the 30 in. main.

The scale on the differential U tube was graduated in 1/100 ft. divisions and by using a liquid of specific gravity of 2.00 in this tube, the readings obtained were in feet loss of head per thousand feet. The advantages inherent in this method are that it is not necessary to obtain the difference in elevation between the two points, and that it eliminates the use of spring gauges. Piezometers could not be used because of the high pressure, all of the lines being under pressure of 125 to 150 pounds per square inch. The pipe and connections for bringing the two pressures to the differential U tube should be water tight for accurate results. However, we found no difficulty in making them up tight. We also found that with pipe of 1½ to 2 in. diameter a slight leak did not materially affect the results. The test extended over a 24 hour period so that both maximum

CHART NO. 1—RESULTS OBTAINED AFTER CLEANING 30-IN. MAIN

saving and postponement of obligatory laying of new mains, the entire cost of cleaning is saved within from six months to one year.

In Kansas City, Mo., for two or three years prior to the summer of 1918 there was always a lack of adequate pressure in the north and east portions of the city. This district is fed from the Turkey Creek pumping station through one 20 in. and one 30 in. cast iron water main. The question of laying additional feeder mains into these districts was abandoned because of the exceedingly high prices of material and the lack of funds. Therefore the proposition of increasing the carrying capacities of the old mains by the cleaning process was resorted to in the fall of 1918.

Tests of High Pressure Mains

Tests were run on the 30 in. high pressure discharge line extending from Turkey Creek station to 17th and

and minimum velocities in the pipe could be obtained. The result of this test is shown graphically on Chart No. 1.

It will be noted that the average pipe coefficient as computed by Williams & Hazen formula was 69.69, this being lower than that in the Williams & Hazen tables for pipe 40 years old. From these tests it was evident that the 30 in. line was far below the carrying capacity of new cast iron pipe. A contract was awarded to the National Water Main Cleaning Co. for the cleaning of 6,000 ft. of this 30 in. pipe.

Pipe Coefficient Increased

Similar tests were run after the pipe had been cleaned and the results thereof are shown on Chart No. 1. The average pipe coefficient was brought up to 116, and at low velocities as high as 120. The carrying capacity of this pipe having been restored to nearly that of new pipe. The cleaning of the 30 in. pipe gave such excellent results that

a contract was let to the same company for the cleaning of additional feeder mains into the northeast section of the city; there being 30, 24, 20 and 16 in. pipe lines in this district.

Similar tests were run on each of these pipe lines both before and after cleaning and the results thereof are shown on the accompanying charts. In all of these cases it will be noted that the pipe after being cleaned was restored to carrying capacity and corresponding loss of head as indicated in Williams & Hazen tables under coefficient 120.

In making the test on the smaller lines, we were unable to place the gauging taps 1,000 ft. apart because of service connections and connections at street intersections.

CHART NO. 2—RESULTS OBTAINED AFTER CLEANING 36-IN. MAIN

They were placed at 200 ft., 250 ft. and 500 ft. apart, depending upon conditions encountered.

The liquid used in the differential U tube was a mixture of carbon tetrachloride and bromoform brought to the required specific gravity by the addition of gasoline. The specific gravity was varied in accordance with the variation in distances between taps on the line to be tested so that in each case the readings on the U tube were directly in feet loss of head per thousand feet.

In the spring of 1919, similar tests were made on the 36 in. flow line from the low service station at Quindaro to the Kas River tunnel, a distance of 17,000 ft. It was found that the average pipe coefficient as computed by the Williams & Hazen formula was 71.5 and that by cleaning this line the coefficient was restored to 122.33.

Method of Cleaning Mains

The methods used by the National Water Main Cleaning Co. for cleaning large mains leave for the Water Department no intricate or expensive co-operative work. The section of pipe to be cleaned is valved off and a cut made at each end sufficient to admit entering and removing the cleaning machine. After cuts are made and the machine inserted, the pipe is then sleeved up and the joints poured,

so that it is only necessary to have the main out of service for that length of time. The actual cutting and repairing of the various mains was done by department forces while all of the other work such as excavating, backfilling, placing of machine, etc., was done by the contractor.

Cost of Cleaning Mains

The contractor's price for cleaning ranged from 26 cents per foot for 16 inch pipe to 45 cents per foot for 36 inch pipe and the total cost, including all expenses for operating valves, cutting and repairing pipe and for all necessary sleeves and material was \$22,046.09 for 43,837 lineal feet of pipe cleaned or 50.3 cents per lineal foot for all sizes.

The total cost of cleaning the various sizes including pavement repairs and operation of valves, etc., was as follows:

7,202 ft. of 16 in. pipe—\$2,472.52 or 34.3 cents per lin. ft.
7,280 ft. of 20 in. pipe—\$3,056.80 or 41.9 cents per lin. ft.
3,371 ft. of 24 in. pipe—\$1,813.56 or 53.5 cents per lin. ft.
8,984 ft. of 30 in. pipe—\$5,640.93 or 62.3 cents per lin. ft.
17,000 ft. of 36 in. pipe—\$9,098.28 or 53.5 cents per lin. ft.

Referring again to Chart No. 1, the average flow through the 30 in. pipe from Turkey Creek Station to 17th and Baltimore before cleaning was 11.1 million gallons per day and the friction loss was 4.23 ft. per thousand feet. After being cleaned, with the same quantity of water passing through the pipe, there was a friction loss of 1.6 ft. per thousand feet or a net gain of 2.63 ft. per thousand feet amounting to 57.8 ft. for a total of 6,000 ft. cleaned. This was also checked approximately with pressure gauges at each end of the line and is equivalent to a saving of 1,460 million foot pounds of work per 24 hours. Had this been a line through which we desired to deliver 11.1 million gallons of water per day at a certain head, there would have been an actual saving in coal of \$6.67 per day or \$2,504.00 per year, so that the saving in one year in coal alone almost equals the cost of cleaning.

CHART NO. 3—SHOWS INCREASE IN CAPACITY OF 24-IN. MAIN AFTER CLEANING

after which the water is turned on behind the machine. After the machine once starts moving it travels very rapidly through the main (3 to 4 ft. per second), coming out at the open end of the section to be cleaned and bringing all the dirt and encrusting material out ahead of it.

The actual time any section of main is out of service depends almost entirely upon the speed which can be made in making the necessary cuts in the pipe and sleeving them up as the actual traveling of the machine from one end to the other of a section of pipe requires but very little time. Usually the cuts on large mains can be so arranged that they can be made and repaired in approximately 12 hours

Increased Carrying Capacity

However, as we carry a constant pressure of 150 pounds, the cleaning resulted either in increasing the pressure in the down town district 15.7 ft. with the same quantity of water passing through the line or with the same loss of head as before cleaning, the quantity delivered through the line would be approximately 19½ million gallons per 24 hours, or an increase in carrying capacity of 8.4 million gallons per day, or nearly 80 per cent.

To obtain the same increase in capacity as the cleaning of the 30 in. pipe resulted in, would mean the laying of an additional 24 in. feeder main. The estimated cost of such

a line at that time was \$88,800.00 and the annual interest on this amount at 5 per cent is \$4,440.00, making a total annual saving of \$6,944.00, as against a total cost for cleaning of \$3,720.50. In the case of high pressure distributing mains the cleaning of the 26,000 ft. of various sized pipe now enables the delivery to the northeast section of town of approximately 12 million gallons per day more than before cleaning without increased head at the pumping station. Therefore it will be readily seen that the laying of additional feeder mains can be postponed for some time by keeping the present feeder mains up to their maximum carrying capacity.

In the case of the 36 in. flow line, it was found on the test before cleaning that with a loss of 2.7 ft. per thousand feet the line was flowing 16 million gallons per 24 hours. This was practically the maximum amount of water that it was possible to put through this line with the limiting head of 50 ft. on the Quindara pumps. The test after cleaning indicated that with the same loss of head, the capacity had been increased to approximately 26 million gallons or 75 per cent. In other words, this gave the department an increase in flow line capacity of approximately 10 million gallons per day, which was greatly needed during the periods of maximum consumption in the summer of 1919. Under normal conditions of consumption, the cleaning of this flow line actually resulted in a saving of 1.7 feet of friction loss per thousand feet.

Cleaning Does Not Damage Pipes

Inspection of the interior of the mains after cleaning disclosed that the machine had no injurious effect upon the interior surfaces. The springs on the machine are not set stiffly enough to cut into the cast iron and in many instances where inspection was made, it was found that the old coating was still in the grains of the iron. The machine in many instances we sent around sharp curves, some as much as 60 degree bends and also through open gate valves without injurious effect. It cleans the walls of the pipe very thoroughly and leaves it practically as smooth as new pipe.

As to the question of how long the benefits derived from the cleaning of water mains may be expected to last, the author has heard it stated many times that after a pipe had once been cleaned the corrosive effect or the formation of barnacles was much more rapid than before cleaning. In fact, the contractor stated that the carrying capacity might decrease the first year but would be less rapid thereafter. With a view to ascertaining what this effect would be on the 30 in. main, permanent pitometer pits were put in so that tests could be run from time to time after the cleaning. Accordingly pitometer and loss of head tests were run again in the fall of 1920 on this main and the results of these tests are also shown graphically on Chart No. 1. It will thus be noted that two years after cleaning, there was practically no change in results from the test run immediately after the pipe was cleaned. This would tend to indicate that the corrosive action is no faster after cleaning than on ordinary new pipe.

The author believes that in the designing and laying of new feeder mains, serious consideration should be given to the advisability of building permanent pits with removable sections of flanged pipe so that a main can be readily and cheaply cleaned from time to time. It is now the common practice among engineers, when computing the size of pipe required to deliver a certain quantity of water, to use the loss of head figures as given in Williams & Hazen tables under coefficient 100, thus providing a larger size than necessary under coefficient 120. It can be readily seen that the interest on the saving in first cost between the smaller and larger pipe will far more than pay the cost of maintaining the smaller pipe at its maximum capacity by cleaning it whenever necessary. Paper read at the American Water Works Association Convention at Cleveland, June 1921.

VANCOUVER ENGINEERS CHOOSE OFFICERS

THE annual general meeting of the Vancouver Branch of the Engineering Institute of Canada was held in the Auditorium of the Board of Trade on Dec. 21. The result of the ballot for the election of officers for the year 1922 was: Chairman, C. Brakenridge; vice-chairman, A. C. Eddy; secretary-treasurer, P. H. Buchan. The three new members of the executive to hold office for 1922 and 1923, elected in place of the three retiring members of a total of six are: J. N. Anderson, Maj.-Gen. R. G. Edwards Leckie and Wm. Small. Two amendments to bylaws were carried.

CENTRAL HEATING PLANT AT NORTH BATTLEFORD

By M. D. Cadwell
Superintendent of Utilities

CENTRAL steam heating was first introduced into commercial circles in North Battleford in the summer of 1916 when the steam main was laid from the power plant to the new public library which was built that year, located on Main Street, 750 feet distance therefrom. The service was so successful that it was decided to extend the system to serve the business section of the city after the close of the war, provided ways and means could be arranged to finance the initial cost of the installation.

A very comprehensive research was conducted by the superintendent of utilities for a period of nearly four years covering the merits of a central heating plant and its adaptation to conditions prevailing in North Battleford.

In the summer of 1920 it was decided that the proposed installation would prove both advantageous and profitable, and the City Council signified its willingness to proceed at once with the installation, provided the patrons would finance the cost of the undertaking. An advance deposit, representing the fixed figure on a unit basis, and proportional to the requirements of each consumer, was agreed upon, and tenders were called for the supply of necessary material. A part of the installation was made in the fall of 1920, but, due to the lateness of the season, less than ten consumers received service during the season of 1920-21. Meanwhile, materials were received from time to time and in the spring of the present year, practically all supplies necessary for the completion of the system were on the ground.

By the end of September, 1921, thirty consumers were receiving steam service and the installation of the distribution system was completed.

The popularity of the service and the ever increasing demand for steam necessitated the installation of a new and larger steam main to supplement the original one laid down. This installation has recently been completed and was put into operation November 26th.

Amount of Piping Used

The complete installation now comprises 5077 lineal feet of piping arranged as below.

Under Ground Mains

743 lineal feet of 12 in. pipe.
270 lineal feet of 10 in. pipe.
326 lineal feet of 8 in. pipe.
920 lineal feet of 5 in. pipe.
1218 lineal feet of 4 in. pipe.
90 lineal feet of 3 in. pipe.
56 lineal feet of 2½ in. pipe.

Under Ground Services

131 lineal feet of 4 in. pipe.
407 lineal feet of 3 in. pipe.
522 lineal feet of 2½ in. pipe.
147 lineal feet of 2 in. pipe.
98 lineal feet of 1½ in. pipe.

Under Ground Drains

94 lineal feet of 1½ in. pipe.
55 lineal feet of 1¼ in. pipe.

All piping is thoroughly insulated and enclosed in a circular casing manufactured in North Battleford and every lineal foot has been graded with an engineer's level, and all lines set with transit.

Complete and perfect drainage has been provided for all piping placed below the ground level. The estimated life of the plant is 50 years.

The total cost of the system, as installed, was approximately \$35,000. The system was designed by the writer and was installed by the employees of the utilities department under his personal supervision. There are now upwards of 40 consumers with the prospect of this number being increased in the very near future.

During the recent inclement weather, upwards of 150,000 lb. of steam were delivered to the patrons every twenty-four hours. Exhaust steam from the generating units at the power plant is used as the source of heat.

While North Battleford now owns and operates a comprehensive and ideal central heating plant, making it the first municipally owned plant of its kind in Canada to date, it has not cost the ratepayers a single farthing and is greatly augmenting the revenue from the utilities.

The operation of this new utility is being watched by engineers and other interested municipal officials from coast to coast, and it is hoped that the example set will in the near future, result in similar installations elsewhere.

Development of Canadian Railway Construction

Author Describes Early Trade Routes and the Economic Conditions Which Resulted in Construction of Railways in Canada — Problems Solved by Engineers When Locating Trans-Continental Roads

BY H. K. WICKSTEED

Formerly Chief Locating Engineer, C.N.R.

CANADA is a very big stretch of country with a vast amount of undeveloped and only partially developed territory. The older portion tributary to Quebec, Halifax and St. John was comparatively compact and accessible. It had a great extent of sea coast, excellent harbors, and its only exports were fish and furs. The fish, of course were carried on their own element, and the initial fur trade prospered by reason of the watery highways which nature had provided. Furs were enormously valuable in proportion to their weight and even if the lines of communication were much broken by rapids and falls and watersheds, the native Indians had already devised means of utilizing them and evolved the bark canoe, one of the most perfect of semi-savage products. Express freight could be carried in them with really extraordinary speed and certainty into the heart of the continent, on the lakes and rivers of Canada. These are an especial feature of the eastern provinces, covered largely by the Laurentian belt of rocks, an enormous U-shaped formation extending from the Hudson Strait clear around by the Atlantic and the North Shore of the St. Lawrence, the Ottawa and the Great Lakes. From Lake Superior it bends to the northward passing within fifty miles of Winnipeg and then forms the eastern shore of Lake Winnipeg and extends on northward to the Arctic Ocean. The average width of this broken country is 200 to 300 miles. The outcrop first seen and known along the St. Lawrence is very bold and high, high enough to be spoken of as mountains, and the cognomen was derived of course from the river itself. As a matter of fact there are no mountains properly so called, but merely a very broken and wrinkled plateau with a very bold front to the south and east and a much flatter slope to the north and west. The highest elevations we have are in the neighborhood of 2,500 to 3,000 feet and in one or two cases the watersheds are very much lower than this, not much more than 1,000 feet above sea level, but the surface of this plateau is almost incredibly broken up, and the rocks being very hard and compact. The hollows have become filled up with water and the result is some thousands of lakes and ponds, some of them very large, some only a few acres in extent. Of rivers properly so called there are hardly any in some sections, the surplus water dropping from one lake to another over rock ledges, and expanding again. Even the Ottawa draining a very large territory is, except for the last 150 miles of its course, which is just without the Laurentian formation, a succession of lake expansions.

The "Great Barrier"

This rough country has been designated the "great barrier" because it separates the fertile lands of the St. Lawrence valley and the Great Lakes basin from the great central plain of Canada, and it was at one time considered a great obstacle to modern methods of travel, but in these early days of the bark canoe it made these very plains more accessible and even the three uppermost Great Lakes were reached by the Ottawa much more easily and rapidly than by the St. Lawrence. Champlain reached Lake Huron, and the French fur traders following after him reached Lake Superior, long before Father Hennepin first set eyes upon the majesty of Niagara. Verandrye easily crossed the 400 miles from Lake Superior to Lake Winnipeg and established posts which were kept in regular communication with Montreal by canoe, and the generation following him, reached the base of the Rocky Mountains by the Saskatchewan River and the Missouri by marches across the plains from these outposts long before anyone had ascended the river.

From a still more advanced post in the same chain of communication MacKenzie, using the same means of travel, voyaged down the great river which bears his name to the Arctic Ocean and up a tributary, the Peace, to where it breaks through the mountains and down the Fraser to within a few marches of the Pacific Ocean which he reached

long before the Lewis and Clarke expedition by way of the Missouri and the Columbia.

The fur trade was the incentive for practically all this enterprise and exploration, and so far from being a "barrier," this heavily wooded country of lakes and rocks not only supplied the fur but the means of transporting it to the sea and of bringing in articles of trade for barter with the Indians. Even in the depths of a northern winter, communication was not entirely blocked and the same routes followed by Indian runners and dog trains, carrying the mails with wonderful dispatch and regularity over the frozen lakes, when the routes across the prairies were practically closed. The forest furnished fuel for the camp fire and shelter from the bitter winds.

After the fur trade came the timber trade and again this rough country was the principal source of supply, not merely because of the forests with which it was covered, but because the lakes furnished the means of floating it out to the St. Lawrence. If the supply of water was too small to float it from one navigable stretch to another the parent lake was dammed back for a few days or hours and the level raised. Then a sluice gate was opened and the logs were carried through with the rush of water to the next floatable stretch and the operation repeated until a navigable river was reached. All the forest timber was not in Laurentian country, much of it was floated down the St. Lawrence and the Ottawa themselves from other tributary streams, but these natural reservoirs contributed greatly to the ease with which it was floated out from remote districts and to this day while the timber men of Minnesota, Wisconsin and the Pacific coast have been using light railways for a generation or more, those of Northern Ontario and Quebec are still "driving" by water.

Reservoirs of Potential Power

These same natural reservoirs, actual and potential, have of recent years acquired a new value as affording opportunities for the storage of water for power purposes, and as the timber industry has begun to wane in eastern Canada, this "barrier" region has come to the front again as one of the greatest depositories of potential power in the world. Nearly all the tributaries of the St. Lawrence on the north except the Ottawa and the Saguenay have very steep pitches on their lower courses, while the grades of the upper reaches are comparatively flat. Where the fall is greatest the volume is also greatest and these points are also nearest to great centres of population. This is a very happy conjunction indeed; but the run off of the natural streams is very irregular, melting snows in spring often swell the volume to many times that of midsummer, the natural reservoir sites and the hard, impervious rocks make another ideal combination for the storage of water in this region, and by using these opportunities the potential value of the St. Maurice has already been doubled. The Ottawa and the Otonabee have been much improved, and the Winnipeg will soon be one of the great assets of Manitoba. One river, the Nipigon, has in common with the St. Lawrence of which it is the ultimate source, so great a natural reservoir at its head that its flow is almost as regular as that of the great river itself, the latter, however, is not a Laurentian river, although it has given its name to the region of its birth. The "barrier" region again has developed a large amount of mineral wealth: the nickel of Sudbury, the silver of Cobalt, the gold of the Porcupine districts, and the iron of the Messabi and Vermilion ranges. And lastly in certain well defined depressions and on its northern slopes the "barrier" has developed a capacity for agriculture on a very considerable scale, so that all things considered the title of "great barrier" has turned out to be something of a misnomer, although 40 or 50 years ago when the first railway surveys were being made through it it did seem to deserve the name. Early trade, it will be seen, was more fostered by the Ottawa than by the Upper St. Lawrence, but, when agriculture became a recognized industry the greater river

came into play as a means of transport. The lower reaches from Montreal to Prescott were much broken by turbulent rapids and the navigation was arduous and difficult, but once the lake expansions were reached a large portion of the arable lands of the original Upper Canada were within reach of schooner and later, steamboat navigation, with only one break between Queenston and Chippawa, some nine or ten miles, only one portage in 700 or 800 miles. Upper Canada also offered a milder climate than lower, and a very large unbroken stretch of fertile land along the lake and river shores. So that when larger vessels came into use as settlement progressed the Upper Ottawa was abandoned as a principal trade route. The Lower river was a great drawback and improvement became a necessity. Partly as a military measure and partly because it avoided many constructive difficulties on the main river, the Ottawa was improved as far as the Chaudiere Falls, and the Rideau and Cataract Rivers made navigable to Kingston for barges of five foot draft. This was a great improvement, of course, over the "Durham" boats.

An Old Trade Route

Another trade route which led to Lake Champlain and through it to the Hudson and New York was by the Richelieu, a route travelled in the very earliest times by the French to and from the country of the Iroquois and used by them in their raids upon the settlers in and about Montreal. The Richelieu navigation was broken by a long rapid at Chambly, and a minor one at St. Ours, and the very first application of the railway in Canada, was a tramway from the St. Lawrence at Laprairie to the Richelieu at St. John's. This portage railway, not only avoided the broken navigation, but shortened the distance from Montreal to Lake Champlain, by some seventy miles. The next steam railway was another portage railway, from Montreal to Lachine, avoiding the Lachine Rapids, and as a corollary to this, was the Carillon and Grenville, avoiding a series of three rapids on the Ottawa. These two railways in conjunction with two river steamers, permitted a very good service to be established between Montreal and Ottawa, which was kept up until a few years ago, and the trip was made in twelve hours, or at the rate of ten miles per hour.

Owing to the difficult transportation on the river, between Montreal and Prescott, the trade of Upper Canada had been rather with the south shore of the lake, through Rochester, Oswego and Buffalo than with the east. This was brought about by the Erie Canal, opened in 1825. It was only a ditch, with four feet of water, but it was a continuous ditch, carrying barges through from Lake Erie or Lake Ontario to the sea, without breaking bulk and bringing it, moreover, to the sea at a port which was open all the year round, and which had an established import as well as export trade.

Then, as now, the St. Lawrence was the river god of Canada, and Canadians looked to it, not only as a means of carrying their own trade and cementing the bonds between Upper and Lower Canada, but of diverting the trade of the West, of what are now the United States, through Canada to Montreal.

The Welland Canal was built and followed by the St. Lawrence canals, with nine feet draught. The whole was completed in 1848, but in the meantime, the Erie canal had built up cities and towns, and these had, in their turn, built up a railway system between New York and Buffalo, and except for passenger service, the canals were almost useless. The nine foot canal open for only seven months in the year, was obsolete before it was completed. The effort of building this canal was a prodigious one for the time and for a struggling colony of small population, and the disappointment was keen. The enterprise for a time exhausted the revenues and credit of the colonies, and while they began to turn their attention to railways, many schemes were originated, but few came to anything. The early roads, it will be seen, were all of the nature of "portage" roads, bridging gaps in navigation. The Champlain and St. Lawrence, before referred to, was opened in 1837. The Montreal and Lachine, in 1847, and in 1852 it was extended by means of a car ferry across the St. Lawrence to the southern boundary of Canada. In 1854, the Erie and Ontario, from Queenston to Chippawa. A more ambitious scheme, but in the same direction and with the same object was the Northern Railway from Toronto to Collingwood. It was begun in 1851 and opened in 1855. It has been a useful development road, but quite failed as a shortcut from Lake Ontario to Chicago.

Portage Roads

A still more ambitious project had its birth about the same time, that of a winter portage from Montreal to Portland. The St. Lawrence and Atlantic was to be built from Montreal to the international boundary. The Atlantic and St. Lawrence was to meet it there and carry it to Portland. This project worried along incomplete for some years, and finally became part of the Grand Trunk Railway of Canada, in common with the Montreal and Kingston and the Kingston and Toronto Railway.

Another portage road was the Buffalo and Lake Huron, which, however, was a little different from the others, in that it merely sought to carry American traffic to the American roads at Buffalo, en route to New York.

All these roads, it will be noticed, were complementary to navigation. Then, as now, there was a feeling that, in the Great Lakes and the St. Lawrence, Canada, the North American continent, in fact, had a great link between the West and the sea, that should be made use of and from which Canada should derive some benefit. The Great Western was the first which recognized the principle of through long distance haul by rail. New York had a through system to Buffalo. Chicago was the origin of lines coming east to Detroit. The map showed that the shortest connection was through the western peninsula of Canada. The West in those days was the west of the United States. Our own West had no commercial existence whatever. Even the Grand Trunk, although immensely valuable to Canada as a development line, catered to the same trade. The Great Western had already taken possession of the natural route through Hamilton, and the Valley of the Thames to Detroit, but the Grand Trunk was not to be thwarted and built to Sarnia and down the Michigan side of the river to Detroit when, finding its share of the through traffic to be got in that way small, fostered the Detroit and Grand Haven with a car ferry across the Lake Michigan to Milwaukee.

Great Western Railway Built

The Great Western proved a considerable success in its youth and the policy of competition began to take shape, the American roads building a similar cut off, the Canada Southern, between Buffalo and the Detroit river, which avoided the heavy drop from the Lake Erie to Lake Ontario level, and also the steep grades by which this rise and fall was overcome. The Canada Southern was probably the first line located on really scientific principles in Canada, the grades being as low as three tenths of one per cent, and it contributed greatly to the New York Central's attaining the commanding position which it has always held as the cheapest east and west carrier on the continent. In an attempt to bluff the Canada Southern into abandoning its enterprise, the Great Western built its "air line" accomplishing some of the objects of the Canada Southern, but in a much inferior way. The Canada Southern had the advantage of knowing just what its function was with existing traffic to count on and foster. The allied New York Central on the one hand and Michigan Central on the other were lines of exceptionally high standard which it could not consistently underrun, and the country through which it ran was generally a very easy one; but it was never the less a fine piece of work.

The year 1867 was that of Confederation and as one of the articles of agreement with the eastern provinces the Intercolonial was initiated to connect the Nova Scotia system at Truro with the Grand Trunk at Riviere du Loup. The Intercolonial was located and built under the direction of Sandford afterwards Sir Sandford Fleming, and is another consistent piece of work as has been abundantly proved by nearly fifty years of operation. The location was largely influenced by political and military consideration; but it is doubtful even if the Ashburton treaty had given the United States much less of Maine than it did, whether a much more favorable line could have been secured although a shorter one certainly could. The Intercolonial has the advantage of crossing the Appalachian chain at an extremely low point—the lowest between the Hudson River and Gaspe—750 feet as compared with 1,700 on the C. P. R.'s short line and 1,310 on the National Transcontinental, the latter built avowedly as an improvement many years later. This is itself an enormous advantage and in addition, it served a great number of the older settlements of New Brunswick and Quebec which were naturally along the sea-coast.

In 1870 surveys under the same eminent engineer were commenced for the Canadian Pacific a much more onerous and greater task—so much so that an effort was made in

the first case to temporarily evade the construction of a line across the "great barrier" which we have described and dwelt upon and to use as much as possible of the navigable lakes and rivers, and connect these by portage railways as a temporary measure. One amphibious route was actually opened up between Lake Superior and the Red River, using a great number of the Laurentian lakes with wagon roads between them and some hundreds of settlers and their effects were actually taken into Manitoba in this way, but the transport was necessarily excessively slow and cumbersome, and even as a temporary expedient it was soon abandoned.

Birth of the C. P. R.

Construction on what was originally called the Thunder Bay Branch was started in 1874 and completed in 1879. Meantime a branch had been built from Winnipeg to the boundary line at Emerson. This gave a through service all the year round via St. Paul or Duluth, and Manitoba was definitely placed on the map. A start had also been made on the Pacific end and a certain amount of line built through the Fraser canyon. It was supposed from the results of surveys made that the main line would pass far north of Lake Superior — but no definite line was laid down at this time although tolerably complete surveys had been carried across the plains and through the mountains. Progress on actual construction was slow as was the settlement of the western prairie country. The scheme for using the minor water stretches had to be abandoned and it became evident that the only thing which would satisfy the needs of population and bind the new Confederation together was a through rail communication from one end of the country to the other, which would be serviceable during the entire year. British Columbia was grumbling about its not being nearer to accomplishment and yet it was a tremendous undertaking for a small population to undertake. Attention was again turned to the possibility of enlisting private enterprise, as in the case of the Grand Trunk and aiding it by concessions of land as had been done in the case of the Union and Central Pacific. A tentative arrangement with Sir Hugh Allan and some associates developed into the famous "Pacific Scandal" and the overthrow of a government and a delay of several years but it soon came into power again, and a new syndicate, a combination of capital, railway experience, and political acumen, came into existence. The railway experience was that of J. J. Hill, the man Canadian, the experience that of the new west of Minnesota and Dakota. The capital was represented by George Stephen, now Lord Mount Stephen and the political manipulation by Donald Smith, afterwards Lord Strathcona.

There were many stormy debates in the Canadian House of Commons when the question of the "great barrier" and its avoidance was very much in the foreground; but in the end the deal was consummated and it was probably on the whole a very good bargain for Canada. The contract was ratified and signed in February, 1881.

Problems in Locating the C. P. R.

One of the points in discussion was whether the line should not go south of Lake Superior instead of north, crossing the boundary at Sault Ste. Marie. In the end both lines were built and the question of a direct route through eastern Canada itself was never in doubt. Callander, at the east end of Lake Nipissing was fixed as the official eastern terminus and the old route of the early explorers and fur traders, the Valley of the Ottawa, became once more the national highway from the Atlantic to the West. J. J. Hill very early dropped out of the combination; but in William Van Horne the new company secured a general manager, an even greater genius, and who became one of the most notable of Canadian citizens as well as its foremost railway magnate. Under his direction construction was pressed forward at a pace unprecedented in Canadian annals, and a direct route along the immediate shore of Lake Superior which had been reported to the government as impracticable, was proved not to be so, and was adopted. I, personally, had very much to do with this demonstration of practicability, and I believe that under the circumstances the choice of route was a wise one. It introduced some 80 miles of very heavy work; but the heavy work was close to the beach of Lake Superior and could be reached very readily by men and supplies. As the company was bound to time as well as not overburdened by financial resources this was a very important consideration. In the second place it avoided the overlapping of the Thunder Bay branch by the main line for some 200 miles as contemplated by Mr. Fleming and made this branch

actually part of the main line, utilizing to the fullest what the government had completed. This represented a great saving in initial cost and operation, although the through distance was somewhat longer. The standard of grades and curvature was somewhat lower than that Mr. Fleming had originated and intended to carry through; but this was not felt until some years later and it was quite up to the average of American roads. West of Winnipeg the route was also much altered. Mr. Fleming had practically chosen the Yellowhead pass through the Rockies, partly on account of its much lower elevation than that of anything to the south, partly because the route of it across the plains lay through very much better country as it seemed for settlement, avoiding the crossing of a corner of the Great American Desert, which jutted in from the south.

C. P. R. Route Through the Rockies

The Canadian Pacific preferred a more southerly route, first because it was shorter, on the map, at any rate, second because they feared invasion from the south by American lines. The country to the north would be completely at their mercy for a great many years to come as far as east-bound traffic was concerned. The pass chosen was the Kicking Horse, much higher than the Yellowhead, but remarkably easy of approach from the east and not very difficult from the west. The really weak point as compared with the Yellowhead was that while the latter provided for an almost continuous descent from the continental divide to the Pacific, the Kicking Horse route opposed several intermediate ones. The most important of which is the Rogers Pass through the Selkirk. This involved a secondary rise of 1800 ft. from the valley of the Columbia to an elevation of 4300 ft. or only 1000 ft. lower than the main divide. This has since been lowered to 3800 ft. by the construction of the Connaught tunnel, five miles long. The Eagle Pass through the Gold Range and the Notch Hill summit are comparatively insignificant, but troublesome nevertheless. The ruling gradients of the line were much below those which had been demonstrated to be feasible further north, and contemplated by Mr. Fleming. One per cent was carried across the plains and to the summit, and through the mountains the standard of the American lines was adopted, 2.2% or 113 ft. per mile. Mr. Fleming's idea was to build a line which would be superior to all other lines, either existent or which could be expected to be built for a very long time, a line which would be equal to the requirements of the distant future. It is the engineer's usual point of view and when funds are plentiful and prospect of traffic abundant it is a justifiable point of view. Van Horne on the other hand was an operating man. His idea was to construct a development line good enough for the purpose with the means at his disposal and in the shortest possible time, and to improve it afterwards as traffic grew. Even from his own point of view the line is by no means perfect, but the sequel has shown that his principles were sound. Cheaply built as much of the line was, it was a hard financial struggle to get it completed and taxed the resources of the promoters very severely, and even after its completion in 1886 it had a hard time to make line depending on foreign roads to take care of its traffic both end meet. Van Horne knew that a transcontinental in the east could hardly be expected to pay its way and he began early in the game to provide branches and collecting lines to give the Canadian Pacific its own entry to the principle centres. Two minor lines, the St. Lawrence and Ottawa, and the Brockville and Ottawa built originally in the interests of the Ottawa lumber trade were acquired. Also a branch of the latter, the Canadian Central, and the Brockville and Ottawa was extended from Sand Point through Renfrew and Pembroke to Callander. This gave an eastern extension to Ottawa and at the same time shut out the Grand Trunk from Ottawa.

The Northern Colonization and the North Shore Railway consolidated under the title of the Quebec, Montreal, Ottawa and Occidental gave it an entry both to Montreal and Quebec. The Kingston and Pembroke commanded Kingston and an auxiliary new line was built under the title of the Ontario and Quebec from Montreal to Toronto via Peterboro. The Credit Valley carried it on to St. Thomas and from a point on this the South Ontario Pacific carried it through London and Chatham to Windsor. The Toronto, Grey and Bruce gave a line to Georgian Bay at Owen Sound and a steamship service gave a summer direct route from Toronto to Fort William. Montreal and Quebec were not winter ports, the Grand Trunk's terminal, Portland, was, and the C. P. R. was not content without its own

approach to the sea. This was accomplished by building from Montreal to Sherbrooke. The acquirement of the International to the Maine boundary and a new line across the centre of the state to the New Brunswick boundary and by existing lines to St. John.

C. P. R. Extends to the Soo

In Northern Ontario the "Soo" branch was built from Sudbury to a connection with the St. Paul, Minneapolis, and Sault Ste. Marie at the latter point. In a very few years the Canadian Pacific had not only built a transcontinental line, but an eastern system covering nearly all the principal points in Ontario and Quebec. The Grand Trunk had, of course, fought hard. It had tried hard to head off both the Soo branch and the Toronto and Ottawa, but it was badly handicapped by an absentee directorate which not only could not act promptly in an emergency but owing to distance could not even appreciate the nature of the emergencies. It did, however, forestall the C.P.R. by extending the Gravenhurst branch of the northern which it had acquired years before, to Callander and North Bay, and secured for itself the all-rail connection between Toronto and the West. After some years of misfortune and discouragements due to grasshoppers, the prairie country began to prosper and grow in population, but with prosperity came discontent and dissatisfaction with rates and service, and it clamored for a new outlet to the sea.

Start of Canadian Northern Railway

The Hudson Bay Railway was much mooted but the scheme did not tempt capitalists and the government did not want any more railway building and out of this discontent grew the Canadian Northern. Two men, both sons of farmers in older Ontario who had successfully carried through several railway contracts on the Canadian Pacific acquired a charter in central Manitoba and built a short line from the existing system northwesterly to Dauphin. Instead of offering it for sale they elected to retain and operate it for a time and in the first year of its operation rather to their surprise it paid its way. Another charter, the Manitoba Southeastern, was acquired, as also the Rainy River, and they conceived the idea of building a new line to Lake Superior, and in 1898 work was started at both ends and after a hard struggle completed three years later, then came a great opportunity. The Northern Pacific had crossed the boundary and built up a considerable system in Southern Manitoba. The parent line was in financial trouble and it was arranged that the province should lease these lines and re-lease to one or the other of the existing lines to Lake Superior. The Canadian Northern secured them and not only did it become the third largest system in Canada but Manitoba and the territories secured the competition for which they had been agitating.

In 1902 the Canadian Northern had nearly 1300 miles in operation extending from Lake Superior into Saskatchewan with numerous feeders, the idea of a second transcontinental line began to take shape, and attention was turned to the east. The Great Northern of Canada from Hawkesbury to R. a Pierre with connections over the Quebec and Lake St. John to Quebec and the Saugeenay district was acquired. The Inverness and Richmond, a coal road, and the Halifax and Southwestern were built with provincial aid in Nova Scotia. A start was made on the James Bay railway from Toronto to Sudbury, besides numerous extensions in the west. In 1906 surveys were started on the final connecting links east of Port Arthur and soon afterwards a connection was established between Toronto, Ottawa and Montreal. The final gap east of Port Arthur, 600 miles to Sudbury, was not closed until 1914, and the last link of all in the transcontinental chain through the Yellowhead Pass and the Fraser River canyon to Vancouver was not forged until 1916; an extraordinary effort in the face of war and other conditions which had arisen in the preceding ten years.

Beginning of Grand Trunk Pacific

Among these conditions was the fact that the Grand Trunk having realized the bad policy of overseas direction and control, had placed in charge a local president in the person of Charles M. Hayes, another American railway man who was competent both to size up situations and act on them. He recognized at once that the Grand Trunk had lost its opportunity and had been badly handled but he started somewhat too late to remedy the mistakes of the early policy. He would have entered into an alliance with the Canadian Northern providing for the use of that sys-

tem in the west, of the Grand Trunk in the east, and a joint section between Port Arthur and North Bay, but apparently no satisfactory terms of agreement could be arrived at. Such an understanding would have altered the economic history of Canada. Failing this a scheme was evolved with the government for the construction of an entirely new line to be called the Grand Trunk Pacific. The Grand Trunk would have been satisfied with a line from North Bay westerly and so would Ontario and all the Western provinces; but politics unavoidably came into a question of such magnitude and the east strenuously objected to government assistance of great amount being given to a line with an American winter port. Quebec wanted its northern territory developed and that western traffic should at least be carried past its capital city, and the result was that the transcontinental project was tacked on to the Grand Trunk's scheme, and the operation of it made part and parcel of the contract. The addition involved an enormous bridge over the St. Lawrence and not content with this a new line was built between the terminals of the Intercolonial at Moncton and Quebec, the excuse being that the latter was far too long and the grades too steep for economic operation and inconsistent with the requirements of a modern, first class railway. As a matter of fact the saving in distance is trifling, only some forty miles, and it was found necessary to break up the high standard of gradients while the total amount of rise and fall is much in excess of that on the Intercolonial. So that the ultimate operating cost will probably be higher than on the older road with some small improvements.

The Grand Trunk Pacific parallels the Canadian Northern from Winnipeg to and through the Yellowhead Pass, and then branches off to the northward while the Canadian Northern turns south down the North Thompson. There was some excuse for the line through northern Quebec and Ontario. As a colonization line it is proving its value, but colonization lines are not built on the scale that this one was, costing \$110,000 per mile. There was an excuse perhaps for the Quebec bridge for it had long been in the minds of the Quebec population. There seems from an economic point of view to be no excuse for the wholesale paralleling through the western provinces and to a lesser extent in the province of Quebec, of lines which had been encouraged and aided by the Federal as well as provincial governments. Admitting that a single line would eventually have been insufficient for the combined needs of the two systems, a second track would have cost very much less even than the first and quadrupled the capacity while the second line merely doubled it. It would have lowered the cost of transportation and probably resulted in reduced rates which was the great aim and object of the prairie country when it voted its aid. It was well within the power of the government to have avoided this paralleling of lines, which by the way is not to be found only in Canada.

Competition Between Three Roads

As things turned out the war of competition between three rival corporations became a war almost of extermination. Two of the competitors, both of which had been of great service in the development of Canada, have been practically wiped out. The third although too firmly entrenched before the fight commenced to be crippled, has been seriously injured.

There is abundant food for thought in the present railway situation in Canada. It is popular to blame individuals and corporations for their greed and selfishness in situations such as this. It is popular to blame governments for their unwisdom and short sightedness, sometimes they are accused of dishonesty, but it is the people themselves who clamored for the competition and encouraged it. It is the people who elect the government from among themselves and practically dictate their policy and in the final analysis it is the people who pay the piper when things go wrong. We all believe that the National consciousness is honest and sound but how many of the ordinary voters, how many of the members whom they elect understand ordinary questions of economics let alone the complicated fiscal questions of railway construction and operation. In short how many of us are fit to be trusted with the management of our own savings, the surplus product of our own industry.

At the present time the cry is public ownership, and 22,000 miles of our railways are now publicly owned and operated. The staff appointed to operate them is of unquestioned honesty and ability, and if let alone it seems certain that they will earn a handsome surplus over their expenses, that they will eventually earn the accumulated

interest on their cost seems too much to hope for, but how long will the management be let alone? Parliament has already shown a disposition to interfere in matters of detail.

Independently of the question of public or private ownership which is much before the public in these days, there are some interesting comparisons to be made between the procedures in the case of the building up of the several systems. The Grand Trunk was built by English contractors and engineers. The difference between an English road through thickly settled country with traffic waiting to be carried, and a development road through a new country of sparse population was not at all understood and money was lavishly spent. The line was too costly for its function as a development road.

Difference in Methods of Construction

The common stock bought in good faith and paid for was buried under subsequent issues of debentures and first, second and third preference shares and never paid a dividend even when the road was making good earnings. The Canadian Pacific under somewhat worse traffic conditions but riper experience, was built with extreme frugality, even parsimony, with timber trestles, scant ballast, sometimes no ballast at all, sharp undulating grades and somewhat rank curvature. It was some time before it paid a dividend but when it did have surplus earnings there were scarcely any securities senior to the stock and reconstruction was commenced almost at once.

The same frugal policy in construction was pursued in the case of the Canadian Northern and the initial bonded debt in the West was for a long time only \$13,000 per mile. As the road became longer and its future more assured this was increased, but for another term of years it was only \$26,000. The expensive conditions under which the mountain section was built led to an increase, but there was at the same time a very much increased potential earning power. The Canadian Pacific was unique in depending for capital almost exclusively on stock which it scattered broadcast over the world. The Canadian Northern was equally singular in marketing no stock at all and depending on guaranteed bonds bearing low interest. The Canadian Pacific was a great financial success. The Canadian Northern has pretty well proved that it would have been a great success but for a combination of adverse conditions piling up just before and after completion.

The Transcontinental and Grand Trunk Pacific, built under the precisely opposite policy of lavish expenditure and permanent work, have so far been so busy trying to meet even their operating expenses that the question of fixed charges has hardly been considered as yet.

There is still much to be done in Canada. Far as we have got to the north with our development we find like older explorers that the point we last reached is not the limit of habitable country. Stefanson claims that it reaches well to the Arctic ocean and perhaps into it; certainly he shows conclusively that we shall not find appreciably lower temperatures than we have reached for instance at Long Lake 55 degrees Fah. Nor do we have to fear any heavier snowfall than in the Rockies. We have still to build through the Peace River pass and on to the Yukon, down the Athabasca and Slave at least as far as Fort Smith. In the Peninsula of Labrador are enormous mineral deposits and we shall have to go after them but it is probable that our mileage will henceforth increase more slowly and it is to be hoped more carefully than of late years. We shall probably go in more for improvement of existing systems, consolidation and in some cases I trust elimination, improvements in grades and curvature and probably as traffic grows denser and capital cheaper, into electrical propulsion.

Railway Policy

It has been our policy on this Continent to build lines of communication in advance of settlement. The policy has proved a good one up to a certain point and in moderation but it may be and has been overdone and especially has it been proved unwise to build high class expensive lines which can have for many years at any rate only low class functions to perform. Canada for some years was very prosperous, easy money begot expensive tastes and standards, and this tendency to extravagance extended to our railways. Our mileage has not only increased much faster than our population, but our costs per mile have increased rapidly at the same time. I think too that we have given perhaps undue weight to the needs of the great wheat growing belt in the heart of the continent and its necessities for export facilities. As population grows, we shall probably find as the

United States did, that we need a larger proportion of our own food products within our own borders and have less to spare for foreign countries; that the older eastern provinces and the wonderfully rich one in the extreme west will be the principal and most profitable markets for the cereals of the central provinces, and that such export that goes on will be more and more through the western gateway on the Pacific which is open for the entire year. The wonderfully easy grades of the Canadian National lines, as compared with the American contribute support to a development of this kind. The development in the United States has taken similar lines and the Central Plateau being shut off by high mountain ranges from both oceans is finding an outlet to the Gulf of Mexico at New Orleans.

All modern roads lead to the sea as the ancient ones did to Rome and closely related to the railway development of the central plains of the continent is the colossal one of bringing the sea itself nearer to the heart of the continent of giving ocean navigation a chance to walk up stairs to the suite of apartments provided by the upper great lakes of the St. Lawrence chain through the original prehistoric outlet by the valley of the Ottawa, which is all Canadian, or the more modern one which it now uses, which is international.

I have spent much time and thought on this problem in the past but it is beyond the scope of this paper and as I think our financiers will say, beyond the means of our \$ or 9 millions of people at the present time, loaded as they are with a very serious debt.

I think, however, that it is safe to say that if the boundary between two English speaking peoples had not been so absurdly placed in the East, it would long ago have been solved and the carriers of the Great Lakes would have had access to the sea and picked up jobs on the Atlantic in winter instead of lying idle for 5 or 6 months in the year in icebound ports, but it must be borne in mind that the question is an international rather than a Canadian one, and less of Canada than the United States.

Writing editorially some years ago on the Georgian Bay Canalization Scheme, A. M. Wellington, one of the ablest of American engineers used these words: "Our belief that the Ottawa River affords the best opportunity in the world for a well planned ship canal is a fixed one and we should be glad to further it by any means in our power but under present circumstances with one country (the U.S.) to reap the chief benefit and the other (Canada) to pay the cost what is the use. Had the route been in United States territory it would long ago have been built and thrown open to the world as an international highway." The same arguments apply to the St. Lawrence improvement. The interest which the great cities of Chicago, Milwaukee, Detroit, St. Paul, Minneapolis and Duluth and their tributary territory have in the Navigation Scheme is huge compared with that of our sparsely populated northern Ontario. Toledo, St. Louis and Kansas City have shown an appreciation of their interests—our own west has displayed practically none but has forced the government to try doubtful experiments looking to a seaport at Hudson Bay. A great circle through Saskatoon and Liverpool looks almost as well on the map as does one through Liverpool and Kansas City. Physically both schemes are practicable, commercially, the first is questionable to many minds. The difficulties in the second are mainly political, but both are open to the objection that the seaports to be used are ice bound for a great portion of the year.

Fresh in our memory are the experiences which Russia had with Archangel and the Neva and the opening of a new port on the Arctic Ocean. Only a little more remote is that with Vladivostok and the struggle with Japan for Port Arthur and the Manchurian branch of the Siberian railway. Paper read before the Engineering Section of the American Association for the Advancement of Science, Toronto meeting, Dec. 26-30, 1921.

With the Chippawa-Queenston power development officially opened, the Provincial Hydro Commission will forthwith give notice to private companies from which it is receiving power supply of termination of contracts. Sir Adam Beck, in his address at Chippawa recently, announced that the new supply would permit of the practically immediate cutting off of over 50,000 horsepower orders, such power supply to be replaced by that generated by the Chippawa. In the same connection he paid a tribute to the United States privately-owned concerns which had on various occasions rendered assistance to the Hydro.

ENGINEERING SECTION, A.A.A.S. DISCUSSES MANY TOPICS

Four-Day Meeting in Conjunction With Society for the Promotion of Engineering Education—Subjects Considered Include Natural Resources, Mining, Stress Analysis, Ice Prevention, Standardization, Railways, Power Development and Education

FOR four days, from December 27 to 30, the Engineering Section of the American Association for the Advancement of Science, with the co-operation of the Society for the Promotion of Engineering Education, was in session at the University of Toronto. In recent years the Engineering Section has been more or less dormant, its members apparently preferring to confine their activities to the great national engineering societies. However, through the enthusiasm of the local committee of the A.A.A.S., this section was revived and at most of the seven sessions held, the attendance was close to one hundred. All sessions but one were held in the Electrical Building of the University of Toronto.

Natural Resources of Canada

At the opening session on Dec. 27, Sir Clifford Sifton, formerly chairman of the Commission of Conservation, spoke on "Natural Resources and National Welfare." He expressed some anxiety concerning the fuel situation in this country, especially since the known supply of anthracite in the United States will last only 80 years. Sir Clifford advocated the coking of such Nova Scotia and Alberta coals as were suitable, pointing out the value of the by-products, gas, benzol and sulphate of ammonia. He thought that our peat deposits would yet be found of value when a real effort had been made to utilize them.

Optical Stress Determination

Following the opening address, Paul Heymans, who has been a co-worker with Prof. E. G. Coker of University College, London, and who is at the present time installing equipment at the Massachusetts Institute of Technology for stress measurement by means of polarized light, spoke on "Ontario Determination of Stress Distribution in Engineering Problems." By the aid of an unusually fine series of colored slides, Mr. Heymans showed the true variation of stress in members of various cross section and in truss members due to secondary bending. Comparison with the stresses as commonly calculated showed the great importance of some method of determining stresses more accurately.

The Tuesday session was concluded by a paper by Prof. Charles Mannebeck, of the University of Louvain, Belgium, on "Return Current Along Submarine Cables."

Ice Formation and Prevention

Opening the session on Wednesday, Dec. 28, John Murphy, Electrical Engineer for the Department of Railways and Canals, Ottawa, described with the aid of moving pictures, "Ice Formation and Prevention, with Special Reference to Frazil and Anchor Ice." Mr. Murphy advocated the introduction of sufficient heat to the metal parts of hydraulic installations to keep their temperature a small fraction of a degree above 43 deg. F. This, he contended, would be sufficient to prevent frazil clinging to them and would obviate the closing down of hydraulic plants due to ice troubles. His own experiences at Ottawa were cited as proof of his contention.

Engineering Standardization

"Engineering Standardization" formed the subject of the address which followed, given by R. J. Durley, secretary of the Canadian Engineering Standards Association. This paper will appear in an early issue of the Canadian Engineer.

Mining in Canada

Wednesday afternoon, Dec. 28, was devoted to papers and addresses on mining subjects. John E. Hardman, consulting mining engineer, Montreal, spoke on "Fifty Years of Progress in Mining in Canada;" Thos. W. Gibson, Deputy Minister of Mines of Ontario, spoke on "Metal Mining in Canada;" A. F. Brigham, general manager of the Hollinger mine, spoke on "Gold Mining in Ontario;" and W. L. Dethloff, chief engineer of the Mond Nickel Co., spoke on "Nickel Mining and Smelting". The last three addresses were illustrated by moving pictures.

Toronto Harbor Development

Geo. T. Clark, chief designing engineer of the Toronto Harbor Commission, opened the session on Thursday with an illustrated address on "Toronto Harbor Development."

R. A. Ross, chairman of the Honorary Advisory Council for Scientific and Industrial Research, followed with an address on "Industrial Research." He traced the development of the work of the council since its formation in 1917 and explained the means by which the problems of manufacture are being sought out and made the basis of research. The studentships, fellowships and bursaries have grown, said Mr. Ross, from 7 in 1917-18 to 46 in 1921-22. Effort is being made to bring about the establishment of a research institute at Ottawa, so that the work may be extended and made more effective for industrial development in this country. The speaker outlined some of the difficulties that had been experienced in the utilization of lignites, instancing in particular the carbonizing problem.

Railway Development in Canada

At the afternoon session, H. K. Wicksteed, formerly chief locating engineer of the Canadian Northern Railway, spoke on "Railway Development in Canada," tracing the building up of our railway system from the initial pioneer lines to the present time. The superiority of grades on our western mountain divisions, as compared with those on the rocky mountain divisions of the United States transcontinental lines was pointed out by the speaker. Mr. Wicksteed's paper appears in this issue of "The Canadian Engineer."

During the afternoon session two addresses on mining subjects were given, one by A. M. McQueen, vice-president, Imperial Oil Co., Toronto, on "Exploration for Oil in Western Canada," and the other by James McEvoy, consulting coal mining engineer, Toronto, on "Coal Mining in Alberta."

Hydro Power in Ontario

The proceedings for Wednesday were concluded by an illustrated address in Convocation Hall by Sir Adam Beck, chairman of the Hydro-Electric Power Commission of Ontario, on "Hydro-Electric Development in Ontario." Sir Adam paid a tribute to the services rendered to the province by the investigators and engineers with whom he had been associated. He contrasted the state of electric transmission when the first developments were made at Niagara Falls, with that now existing. Energy was now being transmitted economically, said he, 254 miles from the Falls to Windsor.

The saving to the people of Ontario brought about by the development work of the "Hydro" was graphically presented by Sir Adam. While in Windsor, power is available for not over 3½ cents per kw.-hr., and if a certain amount be used, for 1½ cents, in Detroit the rate is 8 cents for steam-generated electricity. In Toronto, the average cost of electricity per month in the 60,000 homes served is 87 cents.

Engineering Education

The opening address on Friday was an illustrated one by D. B. Dowling, of the Geological Survey of Canada, on "Engineering Features of the Development of Mackenzie Oil Field."

Following Mr. Dowling's address, the remainder of the day was devoted to a consideration of the problems of engineering education.

R. C. Harris, Commissioner of Works, Toronto, opened the discussion by an address on the "Relation of Industry and the Practicing Engineers to Engineering Education." President Chas. S. Howe, of the Case School of Applied Science, Cleveland, occupied the chair at this and the succeeding sessions.

Mr. Harris stated in opening that as a result of his somewhat extensive experience with engineers, he had come to the conclusion that they were in general deficient in business training. The engineer is frequently unable to relate the creation of physical things to the value of the dollar. He should make the highest type of administrator, but because of insufficient instruction, or some other reason, he is disposed to confine his attention too much to the physical aspects of his work. On the contrary, he should regard himself as a trustee for the physical and financial welfare of his fellows. The engineer does not study human problems sufficiently, said Mr. Harris. Not often is he able to predict with certainty what given people will do under a given set of circumstances. He regards himself too much as a builder and not enough as a solver of economic and human problems.

Certain desirable characteristics of engineers were outlined by Mr. Harris. The engineer should have courage. Engineering failures sometimes occurred, he said, through the engineer giving the client what he wanted rather than what the engineer knew to be necessary. He should

have initiative, he should be positive rather than neutral, should have foresight, be willing to delegate authority, able to assume large responsibilities under emergency conditions, be public spirited and a social factor in his community.

Mr. Harris suggested that the training of engineering instructors might be greatly furthered by the provision of opportunities for travel and contact with the leaders of the profession in other parts of the world.

Dean Mitchell, of the Faculty of Applied Science and Engineering of the University of Toronto, in commenting on Mr. Harris' address, stated that members of the staff of the University of Toronto were encouraged to cultivate outside interests.

Industrial Viewpoint

S. B. Chadsey, of the Massey-Harris Co., supported the view of Mr. Harris that the average technical graduate was inadequately equipped to deal with the varied economic and social conditions with which he is likely to be confronted. He regarded the graduates as remiss in that they seldom stated frankly to the engineering college the essentials for the success of graduates in the pursuit of their profession.

G. W. Winckler, Toronto, advocated the granting of sabbatical weeks to engineering instructors to improve their knowledge and give fresh contacts and enthusiasm.

Prof. R. W. Angus, of the University of Toronto, expressed doubt of the practicability of teaching very young men in college such things as ruggedness of character and ability to act with wisdom in an emergency. He advocated the more extensive contact of a teaching staff with the outside business world.

Prof. Ernest Brown, of McGill University, stated that McGill had introduced instruction in economics some years ago with satisfactory results. Engineering courses in Canada should be, said Prof. Brown, previously technologic. This type of equipment was of immediate value on graduation, but as time went on, the engineer's work became more and more of a business character, being in the case of some consulting engineers only 20% technologic. The speaker believed that engineering college training should be of such general and basic character as to fit men for many kinds of work. The exact subjects of study do not much matter, Prof. Brown said, if the student is able to sharpen his mental tools thereby.

H. W. Bibber, Massachusetts Institute of Technology, advocated the more careful selection of students on entrance to engineering colleges. The social qualities, he thought, were best brought out in college by college activities.

President Howe stated that at the Case School of Applied Science, the men who employ engineers were called in and questioned concerning the character of the product desired.

Engineering Education for the Industries

At the opening of the afternoon session on Friday, a paper by Prof. Charles F. Scott, President of the Society for the Promotion of Engineering Education on "Professional Engineering Education for the Industries" was read by Prof. C. R. Young. The text of this paper will appear in an early issue of "The Canadian Engineer."

Julius M. Williams, member of the Board of Education, Hamilton, in commenting on the paper, pointed out that the owners of business were frequently uneducated men and that there was a certain prejudice against the claims of the educated man for preierment in industry.

President Howe expressed the fear lest the present trend toward the adoption of courses in business had been stration might be overcome. Courses in business had been introduced at Case School, he said, to give the student some conception of the nature of the business situations he would have to deal with, rather than to impart much detailed instruction. Such was desirable he thought, since a large proportion of engineering graduates became executives after they have been on 15 or 20 years.

Prof. Peter Gillespie, University of Toronto, questioned the wisdom of the engineering colleges, taking the time to instruct a student how to dictate a letter. He thought that the time must be spent to better advantage in giving instruction in subjects that required real mental effort.

Engineering Education vs. Vocational Training

On the conclusion of the discussion of the previous paper, Dr. F. W. Merchant, Director of Industrial and Technical Education, Province of Ontario, addressed the meeting on the field of the technical schools of Ontario and their relation to the work of the engineering colleges.

After clearly describing the nature of the work carried on in the technical schools, Dr. Merchant assured his hearers that there was no overlapping whatever, between the technical schools of Ontario and the engineering faculties of the universities. There is no counterpart in Ontario to the polytechnic and technical institutes of the old world and of the United States. The legislation governing technical education in the province, Dr. Merchant asserted, provides that the technical schools shall not undertake engineering courses of the type offered in the universities.

The product of the technical schools would be concerned, said the speaker, with operation and maintenance rather than with design on construction. He thought that such schools formed an admirable selective agency for the engineering colleges, and that the courses offered provided a good training for entrance to the universities. As an instance of the excellent performance of technical school graduates in engineering courses.

Dr. Merchant cited the case of the thirty men from the Central Technical School in Toronto who entered upon engineering courses in the University of Toronto in the autumn of 1920. Of these none failed and the average standing attained was very high. He advocated the recognition of the practical work in technical schools for university entrance, as equivalent to one foreign language, on the same basis as practical work in commercial schools is recognized for admission work in university commerce courses.

President Howe stated that while the general opinion in the United States appeared to be favorable to the strictly academic qualification for entrance to engineering colleges, the candidates from the technical schools often did very well.

Gaps in Industrial Education

In a paper by Prof. Dugald C. Jackson, of the Massachusetts Institute of Technology, which was read by Prof. C. R. Young following the discussion on Dr. Merchant's address, it was pointed out that in the United States there was a gap in industrial education between the elementary trades schools and the professional engineering schools of university grade. "It is imperative," said Prof. Jackson, "to give to thousands of young men who are to make the bulk of the corporals and sergeants of industry that character of training which makes for self-support in the industries." There must, however, be a clear distinction between trades and education and the theoretical and advanced education of men planning to join the engineering profession. The grade of the trades school cannot be exalted without losing its clientele, while the schools for training young men for becoming professional engineers should be of university rank. Continuing, Prof. Jackson expressed the view that "powers of exact mental analysis of problems when the facts are exactly related and beyond that the powers of accurate synthesis are essential to creative industrial practice, and education that does not provide for sound, deep and broad study of scientific theory is inadequate for the industrial engineers who are to become creative leaders."

President Howe, in discussing the paper, outlined the effect of entrance conditions on the performance of students in engineering colleges in the United States. At Case School, he said less than 50% of those who registered actually graduated, more men leaving at the end of the first year than at any other time.

Prof. E. Brown, of McGill University, stated that in McGill a considerable number of unsuitable students had to be cleared out of the first year at Christmas.

Dean George B. Pegram of Columbia University School of Engineering, described the nature of the selection of students at Columbia, pointing out that with a six-year course most of the elimination was likely to be done before men reached the strictly engineering part of the courses.

The concluding function of the convention, so far as the Engineering Section was concerned, occurred on Friday evening when a joint dinner with the Geological Section and with the Society of Promotion of Engineering Education, the Engineering Institute of Canada (Toronto branch), the American Society of Mechanical Engineers (Ontario branch), the American Institute of Electrical Engineers (Toronto Branch), the Canadian Institute of Mining and Metallurgy (Toronto branch), and the Society of Chemical Industry (Toronto branch) was held.

Arrangements for the meetings of the Engineering Section and of the Society for the Promotion of Engineering Education were made and carried out locally by a committee of J. B. Tyrrell (Vice-president of the Engineering Section and chairman at the meetings), Prof. Robert W. Angus, Prof. Peter Gillespie and Prof. C. R. Young (S.P.E.E.)

ADVANTAGES OF HYDRATED LIME IN PAVING CONCRETE

Has Water-tightening Properties and Increases Density of Concrete. Makes Placing Easier

By Tyrrell B. Shertzer

Construction Engineer, New York City

AMONG the most important properties which concrete should possess, when used as pavement foundation or highway wearing surface, are:

First: Ease of placing, to reduce costs.

Second: Density, in order that the internal stresses caused by expansion and contraction due to varying moisture content may be reduced to a minimum.

Third: Strength to resist the wear of passing vehicles and the impact, more particularly that caused by heavily loaded trucks which are using the streets and highways in ever increasing numbers.

The foregoing are dependent upon the preparation of the sub-grade, provision for drainage, fixing of grades, etc., all of which, although subjects of considerable importance, will not be discussed.

"Ease of Placing" involves many considerations and does not mean necessarily the laying of the concrete after it has been deposited upon the sub-grade.

One of the most recent innovations, is the adoption of the central mixing plant. Time does not permit of a dissertation on the advantages and economies of this system which is really the second step in ease of placing, the first step being the design and equipment of the storage yard.

Lime in Central Mixing Plant

When the central mixing plant was first used, considerable difficulty was experienced, due to the unmixing of the concrete by the jarring and vibration of the transporting vehicles. This resulted in a stratification of the concrete, the coarse aggregate settling to the bottom and the other ingredients separating in superimposed layers in the order of their fineness; the top of the mass being composed largely of cement and water. This unmixing caused the mass to stick in the vehicles, so that frequently it had to be dug out. It also necessitated remixing, by hand, on the sub-grade.

Many expedients were tried to overcome this unmixing, but as far as the writer knows, none have proven as satisfactory as has the admixture of a small percentage of hydrated lime. The introduction of hydrated lime seems to have prevented in many cases the separation or unmixing of the wet concrete.

Hydrated lime imparts a workability or mobility to concrete which aids materially in spreading, screeding, belting and finishing in general, whatever method is used. All of this contributes to ease of placing and consequent economy.

It is generally recognized that one of the greatest enemies to concrete is absorbed moisture. Tests have shown that the internal stresses set up by alternate wetting and drying of a mass of concrete, not to mention the freezing of the entrained water, are greater than those caused by temperature or the application of ordinary external forces. The stresses caused by moisture are also the most insidious.

Density, as applied to concrete, has been the subject of much academic discussion, theories and claims as to "Mass-volumes," "Relative Specific Gravities," "Fineness Moduli," etc., have been advanced and argued pro and con.

Hydrated Lime a Water-Tightener

Reduced to its lowest terms, and the one with which the practical engineer is most concerned, density may be rather loosely defined as that property or condition of concrete which causes it to resist the infiltration or passage of water. In other words, water tightness is a function of density, from a practical point of view as it affects the street and highway engineer.

Hydrated lime is the most efficient water-tightening medium available. The statement to the effect that it is the most efficient medium, has been made by the United States Bureau of Standards as the result of an exhaustive series of tests in which all of the available media were experimented with.

The action of hydrated lime, as a water-tightener, is purely mechanical. It is much finer in texture than any of the other ingredients of concrete so that it slips into and

fills up what would otherwise be voids of minute dimensions. Hydrated lime has the property of absorbing its own weight, or more, of water. When wet, it makes a very slippery and sticky paste. The slipperiness imparts workability to the mass and the lime paste acts as an internal lubricant. The stickiness holds the particles together and thus prevents unmixing.

The lubricating effect not only makes the handling and placing of the mass easier, but also promotes a more compact arrangement of the particles of the other ingredients, thus increasing the density.

The property of absorbing water, for which it has no use chemically, being fully satisfied, reduces the free water content of the entire mass since the water is restrained by the hydrated lime. When the excess water evaporates, it does not leave pores or cavities within the mass of the concrete, since it is present, largely, as envelopes of the particles of hydrated lime, instead as of globules or droplets.

The volume of wet hydrated lime varies but little from that of the dry, so that the desiccated hydrated lime in the mass of hardened concrete occupies practically the same space or volume as the wet paste in the mixture. Excepting at or near the surface, the hydrated lime in a mass of concrete undergoes no chemical change. That portion of it which is near enough to the surface to be acted upon by the carbon dioxide of the air does undergo a chemical change and becomes crystalline calcium carbonate, or to all intents and purposes, limestone. ($\text{CaO}, \text{H}_2\text{O} + \text{CO}_2 = \text{CaCO}_3 + \text{H}_2\text{O}$) this change is accompanied by a slight increase in volume of each particle (ratio .74—1.00) thus making a hard, insoluble surface seal. As the surface of the concrete is worn off by traffic, or otherwise, the desiccated hydrated lime, which is then exposed, starts to take up carbon dioxide from the air and forms a new surface seal. Should the moisture penetrate the surface seal in any way, the desiccated hydrated lime within the mass immediately adsorbs it and in so doing swells very slightly, thus forming an effective barrier against the passage of more water. This is the reason why hydrated lime makes concrete watertight.

In passing, it may be of interest to note that when Portland cement sets, hydrated lime is liberated, so that when we add hydrated lime to Portland cement, nothing foreign is being introduced.

As a general rule, the coarse aggregate is the strongest ingredient and the most resistant to wear, so that other things being equal, the concrete containing the largest percentage of coarse aggregate should offer the greatest resistance to wear. The aggregates are also the cheapest ingredients of the concrete.

Experiments and studies, extending over many years, by the Delaware State Highway Department, have proven conclusively that 1-2-4 concrete with 10% hydrated lime gives better service, cracks less, wears better and is cheaper than the 1-1½-3 or 1-2-3 mixes generally used. As a consequence of these tests, the 1-2-4 mixture with 10% of hydrated lime has been adopted by Delaware as well as other states and cities and its use is rapidly growing. A very significant approval of this practice is, that the Office of Public Roads will approve and extend government aid to concrete road projects in which this mixture is specified.

Numerous tests have demonstrated that the compressive strength of concrete is little affected by the presence of hydrated lime, the majority show a slight increase, when the tests have been conducted under conditions approximating field conditions. With the exception of absorption and permeability, both of which are materially decreased, none of the other properties of concrete are affected to any great degree.

The National Lime Association does not advocate the substitution of hydrated lime for Portland cement in concrete mixtures, all of the other ingredients of the mixture remain the same and the hydrated lime is added as an additional ingredient.

Summarizing the advantages of the admixture of hydrated lime in concrete:

It prevents segregation or unmixing, resulting in uniformity.

It lubricates the concrete making placing and finishing easier.

It forms a hard, insoluble watertight skin on the surface.

It promotes a more compact arrangement of the other ingredients.

It is the cheapest and most efficient watertightener.

It retains moisture which assists in the curing of the concrete. Paper read before City Paving Conference, Philadelphia, Oct. 20-21, 1921.

Appendix

An example as to how a saving may be affected by the use of 1-2-4 concrete with 10% of hydrated lime as compared with a 1-1½-3 without hydrated lime.

Let us assume a concrete road 16 ft. wide and of 6 in.-8 in.-6 in. section. Such a road will require about 1,800 cubic yards of concrete per mile.

Using the Taylor and Thompson proportioning tables and current New York prices for materials (as of Sept. 29, 1921) we find the following:

Quantities and Costs of Materials Per Mile of Road

1-1½-3 Mixture:

Cement 3,600 lbs. at \$2.50 net	\$9,000.00
Sand 756 c.y. at \$1.25	945.00
Stone 1,512 c.y. at 1.90	2,872.80

Cost of Materials Per Mile.....\$12,817.80

1-2-4 Mixture:

Cement 2,826 bbls. at \$2.50	\$7,065.00
Sand 792 c.y. at 1.25	990.00
Stone 1,584 c.y. at 1.90	3,009.60
Hydrate 53 tons \$16.00	840.00

Cost of Materials Per Mile.....\$11,904.60

Cost of 1-1½-3 mixture.....\$12,817.80

Cost of 1-2-4 mixture.....11,904.60

Saving in cost of material per mile 913.20

Equivalent to a saving of 7.12%

REPORT ON LONG BRANCH WATER WORKS

SEVERAL letters passed between the New Toronto Utilities Commission and the engineers with respect to Long Branch buying water from New Toronto in which New Toronto was prepared to sell water on a sliding scale from 15 cents to 9 cents per gallon for 100,000 gallons per day, with a minimum bill of \$225 per month. New Toronto would charge a flat rate of 10 cents per 1,000 gallons, plus 62 percent. of the carrying charges on a 16-inch main to the town limits. In a report recently submitted to the Long Branch taxpayers on the proposed water works system, the engineers, Frank Barber and Associates of Toronto, go into the question in detail.

R. O. Wynne-Roberts, a member of that concern, in his report quotes an act of 1918 whereby Etobicoke township was empowered to extend a system of waterworks to connect with any existing system owned by another corporation, and he considered it more satisfactory to pay cash for an extension of the main than to pay for it in the water supply charges. This would then remove the difficulty of the minimum monthly charge which would be a burden upon the residents in the areas not thickly populated.

The extension of a main from 6th street, New Toronto, to 22nd street, or the limits of the town would cost approximately \$40,000, and to retire 30-year seven and one half per cent. debentures on \$24,800 or 62 per cent., would cost \$510 per day should cash be paid.

New Toronto Supply Cheaper

The engineers' report shows that until the daily consumption reaches 200,000 gallons per day, the New Toronto water supply would certainly be cheaper for Long Branch. New Toronto pumping capacity for filtered water is over 9,000,000 gallons per day. At present the G.T.R. consumes about 500,000 gallons per day, whereas an independent scheme for Long Branch district would have to be built up from nothing.

Detailed Estimate of Costs

Inasmuch as 6-inch mains would doubtless be laid as local improvements, according to petitions received, the sum required for the scheme would be:

16-inch mains	\$26,900
12-inch mains	22,500
8-inch mains	10,000
Elevated tank, meter	30,000

6-inch mains	50,000
Birmingham street extension	24,800
	\$164,200
10 per cent. contingencies	16,420
Total cost	\$180,620

This sum includes about 30,000 feet of mains compared with 50,000 feet, costing about \$300,000 in the July report. To retire debentures a tax of 8.7 mills would be levied.

Mr. Wynne-Roberts in closing his report advised that a minimum pressure of 40 pounds per square inch be maintained at all times and 70 pounds for six hours at night to provide for fires.

Supplementary Report

In a supplementary report in answer to Etobicoke council regarding the possibility of obtaining a supply of water in Long Branch at a smaller initial cost, the engineer points out that as there is already a 6-inch main capable of carrying 120 gallons per minute up to 24th avenue. For about \$8,400 a pumping station could be installed on the northwest corner of the Mimico Asylum grounds to raise the pressure. For this water New Toronto would charge 10 cents per 1,000 gallons. Surplus water could be pumped into an elevated tank. The cost of the main would be \$60,600, and when a permanent source of supply had been decided upon the temporary station could be disposed of for around \$4,000.

PROFESSIONAL ENGINEERS' ASSOCIATION MEETS

WITH recommendations urging that steps be taken in co-operation with other associations interested to have public estimates prepared earlier in the year so that works can be put in hand in February of each year instead of July, and that some action be taken toward urging an increase in the number of grain elevators in Vancouver, the 1921 council of the Professional Engineers' Association of B. C. brought their year's work to a close at a meeting held in Vancouver, B.C., on Dec. 26. The appointments by the provincial government to the 1922 council were received and the government representatives will be Prof. E. G. Matheson, J. Peck, G. Wilkinson and W. R. Bonnycastle.

In addition to discussing tentative arrangements for closer co-operation and inter-professional business between the Professional Engineers, the Mining Institute of Canada and the Architects' Institute, the council also made recommendations to their successors which will result in the creation of a legislative committee and a library committee. The latter committee will take in hand and improve the technical library which is now open to all engineers at 930 Birks building; and in addition will furnish a list of technical magazines to the city library, as the authorities there have reported that such magazines are in great demand. New members enrolled included Col. J. M. Rolson, Alex. Barclay, G. W. Allan and G. K. Williams.

NEW HYDRO TRANSMISSION LINES

THE Ontario Hydro-Electric Commission is making good progress building another transmission line from the Niagara river to Toronto. It will carry power from the new plant at Queenston. When it is completed, the Hydro will have four complete circuits between Toronto and Niagara capable of carrying 200,000 horsepower. When the Electrical Development Co. plant is added as a result of the clean-up deal, the Hydro will have six complete circuits. A saving of about fifteen miles in distance and of nearly half a million dollars in the cost of the new transmission line is being affected by running it across the Burlington beach instead of through Hamilton. The towers are being placed well to the north of the Niagara escarpment. The existing towers are on the heights. They are 880 feet apart, which is a record span for swinging electric cables. When the Chippawa canal is working to maximum capacity the Hydro will require five sets of towers on five separate rights-of-way leading from the Niagara river.

The Water Commissioners of St. Catharines, Ont., reference of whose long terms of office was made in a recent issue of "The Canadian Engineer," were a few days ago re-elected once more by acclamation for another two-year term.

AMERICAN METRIC ASSOCIATION MEET IN TORONTO

THE Annual Meeting of the American Metric Association was held in Toronto on December 29, 1921.

Dr. George F. Kunz of New York presided. The members were officially welcomed by Controller Russell Nesbit of the Toronto Board of Control and W. H. Alderson, President of the Toronto Board of Trade.

W. M. Crocker, who represents the American Metric Association in Washington spoke on "The Legal Status of the Metric System and Pending Legislation." The Canadian members present were unanimous in the opinion that the passage of an effective metric bill by the United States Congress would soon be followed by similar action in the Canadian Parliament. The Association continues to present to Congress additional endorsements from National and State organizations of the Britten-Ladd metric bill now receiving the consideration of the Senate Manufacturers' Committee.

Professor Henry G. Bayer of New York University concluded the morning session by speaking on "The Evolution of Metric Weights and Measures." He cited the speech of Talleyrand in April, 1790, on a "new system" of weights and measures advocating, "that other nations should be invited to make it international." Mr. Bayer showed that even then this desire for the advantages of international weights and measures was stirring in America. He quoted as follows from the message of George Washington to Congress on October 25, 1791: "A uniformity in the weights and measures of the country is among the important measures submitted to you by the Constitution; and, if it can be devised from a standard at once invariable and universal, must be no less honorable to the public councils than conducive to the public convenience."

Theodore H. Miller, Works Manager of the De Laval Separator Co. said in part, "About 1910 we changed to the general use of the metric system throughout our plant. The advantages gained by the use of so simple a system as the metric, have been worth to us more than ten times the slight initial cost required to make the change. By placing on our drawings the expression 'All dimensions in millimeters,' we follow the practice recommended by the American Metric Association, and avoid the necessity of placing even the familiar abbreviation MM after figures."

After discussion of the best methods of using the metric system the following resolution was adopted:

"That a copy of the third edition of the booklet, Metric Weights and Measures, be sent to the leading industrial and commercial associations in Canada and the United States with the request that:

(1) This publication be examined by the proper committee or committees with a view to ascertaining whether or not the committee or committees approve of the methods outlined for teaching and using the metric system; and that,

(2) Statements or principles in this publication on which there may be differences of opinion be noted and sent with recommendations for the improvement of the fourth edition of Metric Weights and Measures to the American Metric Association."

Chairman E. C. Bingham of the Committee on Local Sections has co-operated with the American Chemical Society and other organizations in having 300 of the universities and colleges order their chemical supplies in metric units. Manufacturers and dealers have been found very willing to fill orders in this manner.

Edward Richards and other members present from the Society of American Foresters spoke on "The Application of the Metric System to Forestry."

W. W. Pearse of Toronto, well known as a construction engineer, spoke on co-operation in the metric campaign.

ROAD METHODS IN BUILDING WORK

THE time and labor saving plant and methods employed in making concrete roads are seldom applicable to ordinary building work in concrete, but can be adopted with highly satisfactory results on large contracts where extensive floor areas have to be concreted at ground level. A case in point is the laying of concrete flooring in a factory addition in Milwaukee, the total floor area amounting to more than 250,000 sq. ft. By making use of road-paving methods, it is stated that the concrete flooring was laid at the rate of over 9,000 sq. ft. in a working day of 7½ hours. Railway lines were laid outside the building for the delivery of gravel and sand and by trucks, the materials being unloaded by a grab and transferred to a large hopper bin with

separate compartments. Gravel and sand were conveyed from the bin to the concrete mixer by means of side-discharge cars running on a narrow-gauge track. Cement—the only material not handled by machinery—was wheeled to the mixer in barrows. Mechanically-operated trucks were used in delivering mixed concrete, which was discharged direct into the trucks, and therein transported to the required points and rapidly tipped out by the front-tilting body. About 114 trips were made by each truck per day of 7½ hours, or one complete trip ever four minutes. The whole operation of mixing, discharging, and transporting the mixed concrete was planned so as to avoid the slightest loss of time at any point.

IMPORTANT ORDER FOR DOMINION ENGINEERING WORKS

THE Water Works Department of the City of Montreal has recently placed an order with the Dominion Engineering Works Co., Ltd., of that city, for extensive additions to the city pumping equipment and distribution system. The contract includes three 30-million gallon, electrically driven, centrifugal pumps, to operate against a head of approximately 250 feet; 12 36-in. Johnson hydraulic valves, of a combined stop and check valve type; 6 42-in. suction gate valves.

The Johnson hydraulic valves are of special design, and close automatically in case of breakage and drop of pressure in the main on the pump side of the valve, preventing the escape of large volumes of water and consequent damage to property.

The feature which makes these valves peculiarly suitable for water works service is the closing movement, which is rapid at first, then slows up during the last part of the stroke, effecting a complete closing, promptly, yet without water hammer or injurious stress on the piping system. The valves may also be closed at will by the operation of certain simple means for the purpose.

The manufacture of large special gate valves has lately been taken up by the Dominion Engineering Works, as their mechanical equipment enables them to handle such work in the largest sizes yet produced. This is evidenced by the fact that they are now building the largest Johnson hydraulic valve ever made, some 20 feet in diameter, for installation at Shawinigan Falls, Que., under a head of 140 feet. Estimated weight of this valve is 365,000 lbs.

HYDRO INDEBTED TO SCIENTISTS

IN addressing the general session of the American Association for the Advancement of Science in Convocation Hall, on Dec. 29, Sir Adam Beck, chairman of the Ontario Hydro-Electric Power Commission, paid full measure of tribute to the part that science has played in the creation of the largest electric power system in the world.

Not a little of the success of the Chippawa development, stated Sir Adam, was due to the intensive work carried on in the laboratories of the Commission. Problems which appeared insurmountable had been overcome by the intensive application of the most exhaustive research methods. Sir Adam cited the success of the Commission in discovering a cheaper and better concrete mixture as one case in point. Another instance was the invention of an insulator for high voltage transmission lines which had been adopted by almost every country in the world.

As illustrative of the advantage which Ontario enjoyed in possessing cheaper electrical power than could be generated by steam plants, the speaker told the visiting scientists of the difference in power prices between Windsor and Detroit. After being transmitted 254 miles, power had been sold to the consumer in Windsor for four and one-half cents per kilowatt-hour. In Detroit, power generated by one of the most efficient steam plants in existence was being sold at eight cents. Further than that, the surplus earned on the distribution of power to Windsor had been eighty thousand dollars in one year, with the result that six months ago the cost of power in that city had been lowered to three and one-half cents per kilowatt-hour.

Public ownership and development of Ontario's water falls had brought power to the small consumer, to the average householder, and to the smallest communities. A village such as Glencoe, which only used ten horsepower, had shown an annual surplus of \$854. In the City of Toronto the average monthly bill of 60,000 consumers was only 89 cents per month.

PROGRAM AMERICAN GOOD ROADS CONGRESS

THE following tentative program of papers has been arranged for the sessions of the twelfth American Good Roads Congress which will be held at the Coliseum, Chicago, on Jan. 16 to 20 inclusive.

Bituminous Roads

Bituminous Foundations, by Hugh W. Skidmore, C.E.
Selection of Bituminous Bearing Course, by C. M. Pinckney.

Utilization of Local Material for Mineral Aggregate, by Major W. A. Welch.

Asphalt Specifications, by L. M. Law.
Specifications of Mineral Aggregates, by Roy M. Green.
Controversial Construction Requirements in Specifications, by Bruce Aldrich.

A Simple Graphic Method of Proportioning Sands for Sheet Asphalt Mixtures, by Prevost Hubbard.

Portland Cement Concrete Roads

The Selection of the Mineral Aggregate for a Portland Cement Concrete Roads by John H. Mullen.

Design of Concrete Roads for Heavy Traffic, by W. D. Uhler.

Inspection and Control of Materials for Concrete Roads, by R. W. Crum.

Importance of Surface Finish and Methods of Control, by H. E. Breed.

Single Track Concrete Roads for the Average County, by P. C. McARDLE.

Pavement Widths for Highway Serving Large Cities, by Edward N. Hines.

Common Roads

Common Roads, by T. J. Wasser.
A Systematic Study of Gravels for Road Purposes, by Wallace F. Purrington.

Highway Financing

The Proposed Wisconsin Plan of Highway Finance, by A. R. Hirst.

The Minnesota Experience in Highway Financing, by C. M. Babcock.

Highway Traffic and Transportation

Truck Overloading, Its Relation to Road Construction and Maintenance, by J. G. McKay, Ph.D.

Highway Research

Highway Research, by W. K. Hatt.
The Illinois Experimental Road, by Clifford Older.
Highway Researches and what the Results Indicate, by A. T. Goldbeck.

The Highway Outlook, by Thomas H. MacDonald.
Cost Keeping on Highway Construction, by A. R. Losh.
Development of Small Stream Valleys into Traffic Routes, by Jay Downer.

Uniform Legislation as Affecting Highway Traffic and Highway Transport, by D. C. Fenner.

Construction and Maintenance of Earth Roads, by George E. Johnson.

Highway Construction on the Pacific Coast, by Herbert Munn.

Co-operation of All Parties Interested in the Construction of a Modern Road, by William Ord.

The Business End of a State Highway Department, by Charles M. Upham.

The Highway Contractor's Problems, by H. H. Wilson.

ENGINEERING STANDARDS

SEVERAL new specifications have recently been issued by the British Engineering Standards Association, all at the standard price of 1s. each, or 1s. 2d. post free.

A report on standard channels and beams for structural purposes includes details of the geometrical properties, such as the moment of inertia and the modulus of section (moment of resistance). Tables are also added showing the approximate metric equivalents of the British measurements, though it is indicated that the figures in British units are to be regarded as the standard. A specification for tramway axles follows closely the lines of the revised specification for railway carriage and wagon axles, 0.5 per cent. of phosphorus or sulphur being permitted in the steel, though no particular process of making steel is required to be adopted.

Among electrical specifications one deals with metallic resistance materials, which are divided into five classes ac-

cording to the purposes for which they are required. It has not been found possible to specify definitely a value for the resistivity of any type of material on account of the large number of different makes, but it is required that the value shall not differ from the value declared by the makers by more than 5 per cent. A step towards the simplification of switch-gear is marked by the issue of a specification for air-brake knife switches and laminated brush switches and of another for air-brake circuit breakers, in both cases for pressures not exceeding 660 volts. During the preparation of these two reports it was realized that before many of the conditions could be laid down with any certainty a large amount of research work must be done, particularly in regard to rupturing capacity for large sizes and safety of insulation. A comprehensive research is therefore being undertaken by the Electrical Research Association, and it may be possible to extend the specifications when the results become available.

Finally, there is a specification defining the physical and chemical properties required in creosote that is to be used for the preservative treatment of railway sleepers and telegraph and telephone poles.

ENGINEERS REQUIRE BUSINESS TRAINING

COMMISSIONER of Works, R. C. Harris of Toronto, has found after 36 years' experience with engineers, that their university training has been lacking in some important essentials. Mr. Harris stated this year very plainly recently in an address before the American Association for the Advancement of Science.

"An engineer should be essentially a business man, but frequently he is not," said Mr. Harris. "He seems to have been given training exclusively along engineering lines, and often has little ability for studying himself or others."

Mr. Harris said he had found engineers did not have a proper sense of the economic value of their own creations. They delighted in doing things, but could not determine as to the practicability of many of their efforts.

Another point in which he had noticed a lack in the equipment given to the engineer at the university was the faculty for mixing with his fellow men and getting the viewpoints of others. He lies too much in a world to himself, the speaker thought.

A strong criticism was made of the frequent financial hardships worked to business men and public corporations because of erroneous estimates of engineers. Sometimes, the speaker pointed out, works cost three and four times the engineer's estimate, and he considered this a discredit to the profession. A suggestion was made that instructors should be enabled to travel widely and come in first-hand contact with the latest doings in other places.

Brig.-Gen. Mitchell, dean of the faculty of applied science of the University of Toronto, said he agreed with all the criticisms made by Mr. Harris. He held that the faculty should expand its course of training, but he thought under any circumstances it would be found difficult to give a young man all the fundamentals of applied science in four years.

UNEXPECTED TEST OF AN ARCH

A REINFORCED concrete arch of 86-ft. span, forming part of a highway bridge constructed last year at Herkimer, New York, was subjected to an unexpected and severe test when the work of concreting had been completed only 12 hours. Owing to heavy rains during the deposition of the concrete the water in the river spanned by the bridge rose about 5 ft., washing out or undermining the supports of the centring, and carrying away part of the latter to such an extent as to leave the arch entirely without support, save that afforded by the moulds in which the concrete had been deposited. Notwithstanding the sudden strain so imposed on the concrete no injury of any kind was caused in any part of the arch.

The bridge comprises three arches in the river portion, each with a span of 86 ft., a rise of 20 ft., 6 in., and including two ribs 5 ft. deep at the springings and 1 ft. 9 in. at the crown. The ribs are reinforced with $\frac{7}{8}$ -in. longitudinal bars at the intrados and extrados, with transverse and radial rods connecting the main reinforcement. The concrete was mixed in the proportions of 1:2:4, the aggregate consisting of broken limestone. Although the concrete in the first rib moulded was 60 hours old when the centring dropped, the resistance of the arch as a whole is none the less remarkable.

ACTION OF OILS UPON CONCRETE

A CIRCULAR addressed to members by the German Concrete Association recapitulates the various results of tests and experience relative to the storage of oils in concrete tanks. While concrete is unaffected by most mineral oils, those of vegetable and animal origin are apt to be injurious owing to the presence of acids. It is however, considered desirable to line the interior of all oil storage tanks with some impervious material, capable of preventing the oil even if of harmless character, from penetrating the concrete.

The following essentials are stated in the circular mentioned: (1) The lining should be effective in resisting penetration by the oil and the attack of fatty acids; (2) the lining should be able to protect the structure if the latter were afterwards used for water; (3) it should be possible to heat the oil up to the boiling point without injuring the lining; and (4) the satisfactory condition of the tank should be assured not only by means of the lining but also by proper design and construction. Asphalt or kindred linings are not recommended, as they are soluble in oil, a more reliable method being to impregnate the skin of the concrete with a solution of mineral salt, such as silicate of sodium, capable of combining with the alkaline constituents of the cement so as to form insoluble products constituting an impenetrable screen. According to tests conducted at Lichterfelde, a lining proposed by Professor Marcassin has been found perfectly unaffected by an animal, vegetable, and mineral oils. The lining in question consists essentially of margarine, an artificial resin resulting from the condensation of formaldehyde with phenol. It can be employed in the form of an oil paint, which dries so quickly that it may be put in service at the end of a day, and can be applied either to interior rendering or to the surface of the concrete as it is left on removal of the shuttering.

CONTROL PROVIDED FOR LAKE OF WOODS

REGULATIONS providing for the control of the waters of the Lake of the Woods and their maintenance at certain levels, have been approved by the Governor-in-Council. They provide that all dams, structures and other works, which have been, or may be constructed on any outlet of the Lake of the Woods, or on the Winnipeg River at or above its junction with the English River, shall be constructed, maintained, operated and repaired in such a manner as to secure at all times the most dependable flow and the most advantageous use of the waters of the Winnipeg River. They must also regulate and control the outflow of the waters of the lake so as to maintain its level between elevations recommended by the report of the International Joint Commission of June 12, 1917, or between such elevations as may be agreed upon by the United States and Canada, and so that obligations of the Dominion or any of the Province toward the United States in this regard may be carried out.

The Lake of the Woods Control Board must determine the levels and flows necessary to be maintained from day to day or for any period of time in conformity with the regulations. The Board is empowered to "issue to those persons or authorities directing, controlling or maintaining any of the aforementioned dams structures or other works, orders with respect to the levels and flow determined by the Board as well as the manner and method by which they may be maintained."

PRECEDENT FOR HONORING ENGINEERS

RECENTLY, the city council of Minneapolis, Minn., performed an unusual and gracious act in its decision to name the great Franklin Avenue reinforced concrete bridge, which contains a 400-ft. arch span, the longest in the world, the Cappelen Memorial Bridge in honor of the late F. W. Cappelen, who for over twenty years was the city engineer of Minneapolis. It is only too common experience to find small calibre politicians accorded recognition and honor for imaginary services, while the hard working, conscientious and able engineer is wholly ignored. Minneapolis has not only done a signal honor to the engineering profession in according this recognition of the great services of its able city engineer, but has done itself honor in establishing a precedent which it is hoped may be followed by other municipalities under like conditions.

LETTER TO THE EDITOR

WOOTEN-BOWDEN SCHEME VERSUS HYDRO PROPOSALS FOR ST. LAWRENCE DEVELOPMENT

Sir—As you have just completed the publication of the Wooten-Bowden report on the proposed improvement of the St. Lawrence, as well as synopsis of those of the Hydro Electric Power Commission of Ontario, and of Hugh L. Cooper, of New York, and as you have expressed the opinion editorially on October 6th and November 24th, that the position of the Hydro Electric Power Commission in Ontario lends special importance to their representations, I presume you will give me a little space, so that I may help to clear up some things that appear to be misrepresented.

The Hydro report, as submitted to the International Joint Commission, does not give quantities, unit prices, or sections of structures, such as are given in the Wooten-Bowden report for the scheme they recommend, so that a close comparison cannot be made of the Hydro schemes with that of Col. Wooten and Mr. Bowden.

An examination of things that can be compared shows the Hydro estimates of cost for locks, excavation, and lands to be grossly inaccurate and misleading. The amount of power that can be obtained, under their favored scheme "B," is greatly overstated, or stated in such a manner, that the reader would think that the power output from the carrying out of such a scheme would greatly exceed what can be secured by the Wooten-Bowden project. This scheme "B" is practically the same as that presented by the New York and Ontario Power Co. of Waddington, N.Y., and varies only slightly for the works at the Long Sault Rapids, from that put forward by the Aluminum Co. in 1907.

Your editorial of November 24 states that this proposal is, in some respects, superior to the Wooten-Bowden project, but I am sure you have arrived at your conclusion from a very incomplete examination of the merits of each, and before you had read the rebuttals of Col. Wooten and Mr. Bowden. This scheme contemplates no special arrangements or improvements to eliminate the annual ice jams at Cornwall and the Long Sault Rapids, which occur at the present time. It proposes to maintain open water in winter in all the reaches from Cornwall to Galop Rapids and calls for the completion of a power development at Waddington, N.Y., before the development at the foot of Barnhart Island, near the Long Sault Rapids, is made.

Before going on to explain the situation, as the writer has found it, some of the fallacies of this scheme must be pointed out. As Col. Wooten and Mr. Bowden have stated the power obtainable by their project on a very conservative basis, and as the Hydro has stated the power obtainable in their scheme "B" on a very liberal basis, it may be better, in this letter, to state the advantages of each in feet of head, rather than in power.

The head to be obtained in the Wooten-Bowden project, for mean discharge, will be (231.8-156.8) or 75 ft. For low river discharges, it will be (230.5-155.3) or 75.2 ft. At peak load hours, during which time 230,000 c.f.s. may be used at Barnhart Island, the head under the Wooten-Bowden project would be reduced, by a temporary lowering of the upper level, of 0.8 ft., and the raising of the lower tailwater level by 0.6 ft., which reduces the net head to 73.6 ft. The output at peak loads at this head would be 1,750,000 h.p., including the 56,000 h.p. developed at the head of the Massena Canal. In winter the head will be reduced by the effect of an ice cover on Lake St. Francis but as the open water from the Long Sault to Cardinal will be done away with the backwater from the present winter jams, which often reach 25 ft., will practically disappear. By a comparison with similar situations elsewhere, a rise of four feet is predicted in the tailwater level in severe winter at the Barnhart Island plants, due to this ice cover, and this reduction in head in the Wooten-Bowden project will have an ordinary operating head of 71 ft. in winter, and 69.6 ft. while carrying the above described peak loads.

Under summer conditions, the Hydro's scheme "B" must be compared with the above, using the same water levels at the foot of Barnhart Island, as the works proposed below are the same. In their plans, they show a water surface elevation of 241.8 above their Ogden Island dam and a surface slope of 4.65 ft. between the plant at

Ogden Island and Barnhart Island. This gives a gross head development of $(241.8 - 156.8) - 4.65 = 80.35$ ft. This gross head has to be reduced when carrying peak loads, by a loss of 3.8 ft. in the headrace at Ogden Island, where there will be a velocity of nearly 7.0 ft. per second, as well as an injurious surge. It will have to be reduced by 2.0 ft. on account of a surge at Barnhart Island, and 1.5 ft. on account of lower efficiency and loss of kinetic energy due to the double development, so that the net effective head, even in summer, is only 73.0 ft., or slightly less than that in the Wooten-Bowden project.

In winter, however, the situation is quite different, and the Wooten-Bowden project is found to give enormously more power than the Hydro scheme "B." An average additional loss due to the ice jams at Cornwall and above, of at least 15 ft., must be expected, and it will at times be as much as 25 ft. The proposals of the Hydro are to maintain open water from the power plants at Barnhart Island to the plant at Waddington, and from the plant at Waddington to above Galop Rapids by means of ice breaking tugs, if necessary. They thus propose to leave the conditions which have caused the ice jams above Cornwall, still operative, and as these jams have caused an average rise of 18 ft. in seven out of ten of the winters of which we have record, and a maximum rise of 25 ft. in February, 1918, the loss of head is truly appalling, and the net head of 73.0 ft. will be reduced to not more than 58 ft., and may be reduced to 48 ft.

This reduction would not be serious at the plant at Waddington, N.Y., but would be very serious at the plant at Barnhart Island, as all the reduction would fall on it. Fifteen feet head, with the maximum flow permissible, viz. 230,000 c.f.s., amounts to 345,000 h.p., and this fairly represents the output by which the Wooten-Bowden project exceeds that of the Hydro in scheme "B." Further, on account of the large headrace channels leading to the power houses at the foot of Barnhart Island, and the great pondage area provided above Dickinsons Landing, the Wooten-Bowden project, if built, could utilize 230,000 c.f.s. at the Barnhart Island plants, for a period of six hours, and deliver 1,750,000 h.p., while the other power plants as shown in the Hydro scheme "B" have so little pondage to draw from, and such small headrace channels, that the gain from the extra quantity of water utilized will be nullified by reductions in head at the plants, and the actual output at no time would equal the above 1,750,000 h.p. of the Wooten-Bowden project.

The writer is only a special pleader for a single development scheme, as against a double development scheme, when it is assumed either that it is right and proper that a part of Canada's share of the St. Lawrence power be exported to the United States, or that a market for all of it will be developed in Canada before the end of half a century. If, however, it be decided that neither of the above can be accepted, then a double development scheme becomes a close competitor of the Wooten-Bowden project, but not one having any similarity to the Hydro proposals "B" or "C."

The double development scheme, which I have in mind, would place a 62-ft. plant at the foot of Barnhart Island, and equip it immediately, and it would leave a 12 to 19-ft. plant undeveloped at Waddington until needed. Such a project would not injure Morrisburg, Aultsville or Farrans Point, but it would have the effect of placing the development at Waddington in a very unfavorable position. The present value of the Waddington site under such a program would be almost nil, on account of delayed development, and on account of the fact that when put into commission, difficulty would be found in operating the units of such a plant at constant speed. On account of the variation in head that would occur at this plant, it is held by some engineers that its power could not be used except for special purposes. I personally regret that the Hydro did not devote their energies to a study of this project, instead of those they presented.

In the report of Col. Wooten and Mr. Bowden, all reasonable alternative schemes in the all Canadian section of the St. Lawrence were described, and estimates were given of the cost of all these, but in the International section, alternatives were left out for sympathetic reasons. Three schemes might have been submitted, from which it would have been difficult for a non technical commission to choose. However, it is not difficult to choose between that of the Hydro Electric Power Commission and the project submitted by Col. Wooten and Mr. Bowden.

The Hydro, in their report, adhere to the view that Canada should permit the exportation of part of her share

of the power on the St. Lawrence. By this action, they support the project chosen by Col. Wooten and Mr. Bowden, on the only ground on which it is open to attack. It also makes a prophecy regarding the growth of a market, which, when applied, greatly favours the single stage method of development.

167 Carling Ave., Ottawa, Ont. D. W. McLACHLAN.

[Our editorial comment of Nov. 24 could scarcely be interpreted as advocacy of any particular scheme of development for the St. Lawrence Waterway. On the basis of newspaper reports of the Hydro-Electric proposals, which were the only reports available at the time of writing the editorial, it was stated that "it appears that scheme B prepared by the Hydro-Electric Power Commission is in some respects superior (to the Wooten-Bowden one)". No editorial comment on this matter was made in our issue of Oct. 6—EDITOR.]

QUEENSTON HYDRO PLANT OFFICIALLY OPENED

Nearly five years of skilled engineering effort, night and day labor, and overwhelming financial anxiety were crowned with success on Dec. 28 when power was officially turned on at the new Queenston power plant. Sir Adam Beck, on whose shoulders the tremendous weight of responsibility has rested during the entire period, presided at the ceremonies, and received ovations from over 2,000 municipal representatives such as few Canadian public men have been accorded.

When Premier Drury and Miss Marion Beck released the flood of water into the first installed turbine it set in motion the 55,000-horsepower generator. As the machine increased its speed, the first of Chippawa's power gradually brought into brilliant illumination a large sign on the wall of the power house: "Queenston-Chippawa Development, the largest Hydro-electric plant in the world. Ultimate capacity 650,000 horsepower."

From a faint glow of light to a white glare the electric sign gradually mounted as the generator picked up to its normal speed of 187 r.p.m. The whole of the official ceremonies occupied less than fifteen minutes.

Outstanding in Sir Adam's utterance at the after-luncheon address was his summarization of what the excess of estimated cost actually meant to Ontario power users. It meant just one-sixth of one per cent per kilowatt hour for power users, who were now paying two cents for Hydro, as against four and five times that price under private ownership.

"I ask you," he interrogated, "is that going to make it impossible for you to meet your obligations to the Government? Can you expect to default in any respect, shape or form because of the increased cost? No one regrets the \$30,000,000 expenditure in excess of the first estimates more than I. No human being could have foreseen that \$30,000,000."

Sir Adam enumerated all the plant additions and improvements which the \$30,000,000 excess of estimated cost had brought to the Province. It had meant a tripling in power productiveness, and out of it a duplicate canal had been provided for, vast improvement in projected power house structure, and certain moneys mounting into the millions appropriated for the commendable purpose of restoring the Chippawa fort. No one, he said, could compare the original scheme at the initial estimate of cost with the present project, involving \$30,000,000 additional expenditure.

WANT ENGINEERING PROFESSION PROTECTED

THE London branch of the Engineering Institute of Canada is taking steps to petition the Ontario Legislature to make the engineering profession a closed one, and, together with other branch institutes, will present petitions to the Government at an early date praying that legislation to that end be spread on the Ontario statutes.

A closed engineering profession means that no one would be allowed to do engineering work unless he was a member of the Engineering Institute of Canada, and membership in that body is made contingent upon the application for admission holding a degree from a qualified school of science.

The local branch of the Institute, of which H. A. Brazier is interim chairman, will hold its annual meeting the third Wednesday in January, at which time officers for the coming year will be elected. The meeting will probably be addressed by J. M. R. Fairbairn, of Montreal, president of the Engineering Institute of Canada.

GUARDING AGAINST FATIGUE IN METALS

FOR many years following the notable investigations of Wohler on the fatigue of metals, it was common practice amongst bridge engineers to fix working stresses so as to guard against the possible breakdown of the metal by fatigue. Care was taken to base the adopted unit on the relation of maximum to minimum stress, however tedious the calculations might be. In recent years, however, little regard has been paid to this relationship, it being always provided that the stresses realized would not under any circumstances exceed the elastic limit.

portance created during recent years. As a result of this and similar problems, the National Research Council of the United States organized an investigation of the fatigue of metals supported by the Engineering Foundation and the General Electric Co. The work was carried out at the Engineering Experiment Station of the University of Illinois by Prof. H. F. Moore and Prof. J. B. Koppers, and the results were published in a recent bulletin of the Engineering Experiment Station.

As a result of the extensive experiments conducted, it has been established that there is a well defined endurance limit below which metals can withstand one hundred millions or more reversals of stress without evidence of damage. With the increase of the stress above such limit, the number of reversals required to produce breakdown gradually decreases. This observation is in accord with the earlier investigations already cited. In the field of ferrous metals there appears to be no simple relation between the endurance limit and the elastic limit, the ultimate tensile strength affording a better index of the endurance limit under reversed stress than does the elastic limit. The Brinell hardness test furnishes a still better index of the endurance limit, although the reason for this is not clear.

A special incentive to the study of metals under repeated stress was given in the design of aeroplane parts during the late war. Behavior of the material of welded ships under repeated stresses was another problem of importance. It was hoped by the investigators that accelerated or short time tests of metals under repeated stress using high stresses and consequent small numbers of repetitions to cause failure would give a reliable indication of the ability of metal to withstand millions of repetitions of low stress. Unfortunately, this hope was not followed by favorable results. It did develop, however, that for ferrous metals the endurance limit could be predicted with a fair degree of accuracy by the measurement of rise of temperature under reversed stress applied for a few minutes. It is believed that this test can be developed into a reliable commercial test of ferrous metals under repeated stress and possibly to non-ferrous metals, although its applicability to such has not been investigated. In none of the ferrous metals tested did the endurance limit under completely reversed stress fall below 36% of the ultimate tensile strength. For only one metal did it fall below 40%, while for several metals it was more than 50%.

In the latter quantitative observations there is found support for the commonly accepted working stresses used in structural practice. More frequently than not, the working stress adopted is below 50% of the elastic limit for all probable combinations of loading and for structures where stresses are permitted in excess of this fraction, the number of occasions on which the stress would be realized would be so small as not to cause any danger of failure through fatigue. The results of the investigation conducted by Professors Moore and Koppers will no doubt be received with a great deal of interest and careful consideration by all engineers having to do with structural materials.

GETTING THE MOST OUT OF A RAILROAD

REMARKABLE developments in the efficiency of operation of the Ford railroad, the Detroit, Toledo and Ironton, has directed the attention of railroad engineers to what has been done in that time. Brushing aside the sentimental and palpably absurd statement attributed to Henry Ford that in order to make the railroad pay he would reorganize them "in such a way as to get rid of the unproductive stockholder." It is seen that there is apparently some sound reason for the astounding improvement in operating efficiency on the Ford road. It is stated, for example, that with 40% less force a tremendously greater tonnage is being hauled over the line than was previously the case. By speeding up the movement of freight on the preliminary part of its journey, it has been possible to expedite delivery by from 7 to 14 days. According to Mr. Ford, a considerable physical handicap on railroad operation is created through engines and cars four and five times as heavy as they should be. On the Detroit, Toledo & Ironton old and light types of engines and cars being used, later to be displaced by improved types of lesser weight than commonly employed on the railroads of this continent.

In a recent interview, Sir Henry Thornton, director of British army transport in Britain and France during the war, stated in Toronto that the railroads on this continent have gone to an extreme in making up heavy trains with 70 to 100 large freight cars requiring enormous locomotives and bridges of prodigious strength. The capital outlay thus imposed, said Sir Henry, has been staggering. Sidings of great length, very large stations, heavy rails and costly facilities all over the line have become necessary. According to his view, the result of this condition has been that the whole railway system is only suitable for very long freight and passenger traffic. Local passenger and short haul freight traffic are therefore not attractive to our steam railways and a commutation suburban service is frowned upon as unprofitable.

Such statements of opinion are calculated to bring about a reconsideration of the proper basis for successful railway operation. In these days when Canada has a stupendous railway problem upon its hands, nothing that promises relief and improvement should be overlooked.

PERSONALS

T. L. S. LANDERS, Edmunston, N.B., has been elected an associate member of the American Society of Civil Engineers.

C. McNAUGHTON STEEVES of Edmunston, N. B. has been transferred from associate membership to membership in the American Society of Civil Engineers.

PROF. J. A. McLELLAN was chosen chairman and U. P. Dobson, of the Ontario Hydro-Electric Commission, secretary, of the Committee named to arrange for the discussion of the Toronto section of the American Metric Association.

BRIGADIER-GENERAL H. N. RUTTAN, formerly city engineer of Winnipeg, was a few days ago made a Companion of the Order of St. Michael and St. George at an investiture held at Government House, Winnipeg.

CAPT. W. J. STITT, formerly of the marine staff of the Toronto Harbor Commission, and latterly with Roger Miller & Sons, Ltd., contractors, Toronto, has been appointed as Canadian representative of the Dake Engine Co., Grand Haven, Mich., manufacturers of marine engines, contractors' hoists and swinging engines, cranes, blowers, centrifugal pumps, sand dredging pumps, boilers, etc. Capt. Stitt has opened an office at 45 Adelaide St. E., Toronto, where he will be available in connection with repairs and service work for Canadian installations. He has been representing the Dake Engine Co. for the past twenty years during the winter months in Toronto for the past seven years but each summer he has returned to marine work. Arrangements have now been made, however, whereby Capt. Stitt will devote his entire time to the interests of the Dake Engine Co.

HORACE L. SEYMOUR, C.E. (Tor.) A.M.E.I.C., town planning engineer, of the firm of Frank Barber and Associates, Ltd., Consulting Engineers, Toronto, has been retained as city planning consultant to the City of Niagara Falls.

The first work will be that of consulting with the city engineer, Mr. J. C. Gardner, B.A. Sc., A.M.E.I.C., in the preparation of study maps and data. This information will form the basis of zoning maps and proposed zoning ordinances, as well as for other features of a city planning scheme. In Ontario cities but little has been accomplished in comprehensive city planning. Some Canadian cities have taken advantage in the past of the assistance furnished by the Commission of Conservation with Mr. Thomas Adams as town planning adviser. The time has come when each city must plan for itself and the City of Niagara Falls is one of the few in Ontario who are taking their zoning and city planning problems seriously. The advantages of city planning are evident and it is hoped that more Canadian municipalities will follow the excellent example furnished them by the City of Niagara Falls.

RECENT PUBLICATIONS

STEAM CONDENSING PLANTS is the title of a paper read by Paul A. Baneel before the Baltimore section of the A.S.M.E., which has been reprinted and issued in bulletin form by the Canadian Ingersoll-Rand Co., Sherbrooke, Que. In this interesting paper the author outlines the principal

fixed and operating charges in surface condenser plants and then proceeds to describe a new type of condenser developed by this company. This condenser is characterized by a special shell and cooler design combined with an arrangement of tubes in stages which results in the practical elimination of waste tubes and a condenser of greatly reduced surface. The bulletin contains a considerable amount of technical information covering the operation of surface condensers with special reference to corrosion, temperatures, cause and effect of foreign matter in tubes, etc. In the concluding pages, the merits of barometric and jet condensers are dealt with in a comprehensive manner. Copies of the bulletin may be obtained from the head office or from any of the branch offices of the company.

MASONRY REPAIRS—Bulletin 134, issued November, 1921, by the Cement-Gun Co., Inc., Allentown, Pa.; 6 by 9 in., 24 pages, 40 illustrations. The "Cement-Gun" has proven itself a machine of very great usefulness in a wide field of engineering endeavor, but in none has it met with more success or extended use than in the repair and rebuilding of masonry brick and concrete structures. Bulletin 134 illustrates a number of cases which may serve as a guide for similar use of the "Cement-Gun" elsewhere. Illustrations and information are presented regarding repairs to stone masonry at Governor's Island New York, to an arch bridge near Lancaster, to brick buildings and bridge piers, railroad tunnels, brick sewers, concrete dams, bridge piers, sea-walls, reservoirs and other structures.

THE CANADA YEAR BOOK 1920, published by the Dominion Bureau of Statistics, Ottawa. The Year Book contains as formerly a great deal of interesting information covering agriculture, trade and commerce, minerals, manufactures, etc., of Canada. All sections contain the latest information available and the tables include, where possible, the figures of 1920. The leading article this year is on the subject of "Reconstruction," while other additional subjects dealt with are: an increase in agricultural statistics, more especially in the analysis of agricultural prices; the compilation of statistics of Canadian trade according to the improved classification of commodities over a period of four years; an analysis of the statistics of passenger and freight railway services and receipts; and a valuable summary of the financial statistics of cities of 10,000 and over. Another interesting feature noted is the reorganization and expansion of two sections namely, the Climate and Meteorology section and the Labor and Prices section. Copies may be secured on application to the King's Printer, Ottawa.

INTEREST SHOWN IN TOWN PLANNING

DURING the past few years the necessity for a regular system of town planning has become the centre of much interest and study, particularly by public-spirited bodies anxious to promote civic development. One of these societies in Toronto, the Down-town Association, plans to obtain, some time in the near future, a City Planning Commission for Toronto. In view of this, the association has shown considerable interest in the cities and town planning course at the University of Toronto from January 9 to January 21, and a prospectus of the course has been sent to each of its members.

Everything connected with city or town improvement will come up in the course of the lectures and discussions. Expert opinion will be available on actual problems brought up by those attending the course. Difficulties will be discussed to find the best solution, and everything will be done to make the course practical and useful to municipal officials and others who wish to study the subject.

The four divisions of the course consist of economics, sociology, administration and technical town planning. Any of these sections may be taken without the others and single lectures may be attended for a small fee. Already two applications from Alberta have been received at the University Extension office.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Construction Scarboro Twp. Waterworks System

First Township in Ontario to Own and Operate Its Own Water Works System — Officially Opened on Dec. 1, 1921 — Description of Plumbing and Filtration Plant, and Reservoir

BY W. D. PROCTOR, B.A. SC.,

Resident Engineer, James Proctor & Redfern, Ltd.,
Consulting Engineers

WHILE the official opening of Scarboro's new Waterworks system by Reeve J. T. Stewart of Scarboro Township took place on Thursday, December 1, residents of Water Area No. 1 have been using the new supply since Thanksgiving Day, November 7. The entire system consisting of 19 miles of mains is now in full operation. A description of the general layout of the plant and the process of filtration has already appeared in "The Canadian Engineer" under date of May 26, 1921. This plan was followed in construction throughout and only a few changes not affecting the general layout were found necessary. In this article the writer will endeavor to give a description of the methods of construction used.

Work Included in First Contract

The first contract let in April to the Central Foundation Co. included the construction of the intake, low lift pump house, pipe lines up the gully and catch basin at the top of the gully, 180 ft. above the lake. The low lift pump house was the first structure on which work was commenced. For this it was necessary to cut into the side of the bank. Excavation was done by hand and was carried 10 ft. below lake level for the suction well floor. The excavated material was dumped in front to form a sea wall and the concrete anchor blocks for the intake were also cast in front to give additional protection against storms. The excavated material was blue clay and a remarkable fact was the manner in which the walls of clay 12 to 30 ft. high stood up without shoring of any kind. Outside forms for the concrete were not used up to main floor level. No trouble was

FILTER PLANT AND HIGH LEVEL PUMP HOUSE.

experienced from water although the south wall excavation was on the original shore line and nothing more than a small diaphragm pump was ever found necessary.

The low lift station is built entirely of concrete heavily reinforced in the walls, floors and roof. The concrete was mixed on the plateau 185 ft. above the lake and was passed through wooden troughs to the forms below. The trough was divided into three sections by inserting two hoppers to check the speed of flow and to save the mix from being disintegrated. The first section was 176 ft. long and sloped 29 degrees from the horizontal. The second was 184 ft. long and sloped 27 degrees to the horizontal. The third section was short and the chutes were adjusted to suit the section poured, the longest one used being 52 ft. The trough was made of material 2 in. x 10 in. with open top. A mix of one cement to four of pit run gravel was used throughout. The system of "chuting" the concrete was found to work satisfactorily, the hoppers serving to retard the flow and prevent the mix from being broken up. Allen Brothers of Birchcliffe supplied the gravel used.

Steel Intake Pipe

The intake consists of 24 in. steel pipe in 30-ft. lengths with flanged joints bolted together by 20 $\frac{3}{4}$ -in.-diameter bolts and nuts. Basswood gaskets were used throughout. At the shore end of the intake, a 10-ft. length of pipe was cast into the sea wall. When the wall had set sufficiently, excavation was begun outside the sea wall by a dredge which had dug a channel for itself in from the lake. Pipes were laid from the shore end out in an excavated trench till water 20 feet in depth was reached at a distance of 1800 ft. from shore. From this point on, the pipe

LOW LEVEL PUMP HOUSE

was laid on the bottom of the lake to a point 2560 ft. from the shore. The water at this point is 27 ft. deep at mean water level. A 24 in. x 36 in. increasing elbow is built into a protecting crib at the outer extremity. This crib has two outer compartments filled with one man stones and an inner compartment which is covered over on top and which protects the intake inlet. The crib is built of 6 in. x 6 in.

POURING WALLS OF COAGULATION BASIN. FORMS FOR RESERVOIRS IN FOREGROUND. FILTER PLANT IN CENTER.

and 8 in. x 8 in. timbers bolted together with a clear opening between timbers of 3 in., through which the water is drawn. From the point where the pipe laying commenced on the natural lake bottom the pipe is held in place by two concrete anchors 2 ft. 6 in. x 2 ft. 6 in. x 4 ft., one on each side of the pipe and held together by a $\frac{3}{4}$ -in. diameter link chain. These anchors are placed 20 ft. apart out to the crib. Work on the intake commenced on June 14, 1921, and was completed on September 9, 1921. Inspection of the intake on November 22, 1921, after several heavy easterly storms showed that there was no sign of scour at any point and that the pipe laid in the trench had become buried and throughout its entire length the pipe was resting solidly in place.

The suction well is divided into two compartments by a screen of $\frac{1}{4}$ -in. copper wire mesh through which the raw water passes. This serves to collect any solid particles which may be carried into the well. A $\frac{1}{4}$ -ton Morris travelling chain block is provided for lifting the screens from the well and moving them outside where they are washed by hose pressure.

Low Lift Pumping Station

The low lift station houses 2 vertical single acting triplex plunger pumps, of 300 g.p.m. capacity, each operated by a 30 h.p. slip ring motor. The pumps are connected in parallel and may be operated from the filter plant above by means of a remote control apparatus. Hydro electric power is supplied to the motors at 550 volts. The pumps are of Smart-Turner design.

Two cast iron pipe lines were laid up the ravine a distance of 900 ft. from the lake to the catch basin. Water is pumped up through the 12-in. main to the filters above and the 16-in. main serves to carry off the surface drainage which formerly ran down the gully, and also the wash water from the filters. By carrying the surface drainage water down through this drain and discharging it into the lake it is expected that erosion in the gully will be largely stopped.

A 4-ft. walk has also been built which leads from the catch basin down the gully to the low lift pump house. This is constructed of posts to which are bolted 2 in. x 10 in. stringers on which 2 in. x 4 in. s. are nailed. A railing is also provided on both sides of the walk.

Work Covered by Second Contract

The second contract was awarded in May and included the filtration plant and high level pumping station as outlined in "The Canadian Engineer" dated May 26, 1921.

Work on this contract was begun during the first week of June and steadily progressed to final completion on December 1.

The walls and floors of the suction well, mixing chamber and filters were of reinforced concrete in which super cement was used. The walls and floor of the east filter were poured in one continuous pour. The walls and floors of the mixing chamber and west filter were combined to make one continuous pour. All piping which passes through the walls of the filters was cast in place in the walls.

The concrete walls of the filters are carried above the main floor level and as the specifications called for a continuous pour in the filter walls, provision had to be made for placing the main floor of the building later. This was done by setting the floor beam reinforcing in place and leaving a slot 2 in. deep along the face of the wall to receive the slab. Six inch concrete haunches were also formed into the wall under the beam ends to relieve any shearing tendency of the beam at the wall due to the joint.

The walls above the filters are built of brick. A dark red pressed brick was used outside and buff colored pressed brick inside. The roof over the filter beds is carried on 8 in. I-beams at 18.0 lbs., and is waterproofed with Barrett specification 4-ply tar and gravel roofing. The ceiling in the filter room is sheathed with T. & G. pine. The roof over the pump house proper is carried by frame trusses spaced at 15 in. centres. 8 in. asbestos shingles are used as a roofing material and a 3 course band of red tile around the centre gives it a very pleasing appearance. Metallic ceiling material was used in the pump house.

The pumping equipment at the high level station consists of two centrifugal pumps, one driven by an electric motor and the other by a gasoline motor. The electrically driven centrifugal pump is built to deliver 600 g.p.m. against a total head of 225 ft. and was manufactured by Canadian Allis-Chalmers Co. It is driven by a 60 h.p. squirrel cage, C.G.E. motor. The gasoline driven pump will deliver 750 g.p.m. against a head of 225 ft. and was manufactured by the Goldie & McCulloch Co. It is driven by a 4 cylinder Van Blerck motor of 100 h.p. capacity.

Coagulation Basin

In the construction of the coagulation basin, the special waterproof joint provided for in the specifications was used. This was made by leaving a recess in the floor 6 in. deep to take the walls. This recess was treated with a 3-ply thickness of burlap, each ply being applied with hot asphalt. This type of joint has been found to give very satisfactory results. The walls were carried up in one continuous pour. Baffle walls running longitudinally in the basin were constructed of 2 in. concrete walls at 4 ft. centres. These walls

OPERATOR'S HOUSE—COAGULATION BASIN AND FILTER AND PUMP HOUSE

were constructed as follows: 1 in. x 1 in. angles were used as studding and were fastened by dowels to the floor and roof beams. Metallic lath was securely wired to this studding. Cement mortar containing a small percentage of lime and hair was plastered on to this. To obtain the 2 in. thickness called for, it was necessary to apply 3 coats to each side of the wall, one rough heavy coating, one scratch coating

and one finishing coat. These walls were braced laterally by 2 in. x 6 in. horizontal braces. This was found to make a very rigid job and satisfactory in every way. The baffle walls in the mixing chamber were constructed in a similar manner. In the mixing chamber 1 in. baffle boards are also provided to further mix the water.

SINGLE ACTING TRIPLEX POWER PUMPS

No special features in construction were used in the filtered water reservoir that have not already been mentioned. The special joint between the floor and walls was used there also with success, and the walls were poured in one continuous pour. Since the contract for the filtration plant was let in May, a further contract was let in September for the erection of a 6 roomed house for the plant operator. This was built just west of the filtration plant and is already occupied. It is built of red pressed brick similar to the filter house.

Cost and Summary of Work Done

During the past summer watermain extension work has also been carried on and at present the Township have approximately 19 miles of mains under pressure. Service connections have been installed into 500 homes to the end of December and 425 services are in actual use. All services are being metered, Trident frost-proof meters being used. Lead pipe is used for all service connections to the street line. The standard service is $\frac{3}{4}$ in. pipe.

The cost of work has been as follows:

Watermains	\$311,404.00
Filtration plant	168,464.63
Stand pipe, 90,000 gal. capacity	15,657.32
Total	\$495,525.95

The following were the contractors: Intake, low lift station, mains up gulley and catch basin, Central Foundation Co.; Filtration plant, coagulation basin and filtered water reservoir, Central Foundation Co.; Dwelling house and steps down ravine, Central Foundation Co.; Filter equipment and installation, American Water Softener Co.; Cast iron pipe, National Iron Corporation; Cast iron specials, Dominion Wheel & Foundries, Ltd.; Valves, Kerr Engine Co. and Drummond & McCall, Ltd.; Hydrants, Drummond & McCall, Ltd., and Dominion Steel Products; Standpipe, Canadian Des Moines Steel Co.; Intake pipe, Horton Steel Works Ltd.; Triplex pumps, Goldie and McCulloch Co.; Electric driven centrifugal pump, Canadian Allis-Chalmers Ltd.; Gasoline driven centrifugal pump, Goldie & McCulloch Co.; Chlorinator, General Supply Co.; Venturi meter, Allen General Supply Co.; Alum dissolver, Bannon Co., Ltd.

The following is a summary of the work done:

Watermains laid, 15,521 feet 12 in.; 8,734 feet of 10 in.; 14,116 feet of 8 in.; 60,358 feet of 6 in.
Hydrants set 218.
Valves set 152.
Intake pipe laid, 2580 ft.
Constructed low lift pump house.
Constructed piping up gulley and around plant.
Constructed filter and pump house building.
Constructed one 6-room house.
No. of pumps, 4.
Chlorinators, 2.
Alum machines, 1.
Built walk to lake front.
Built 90,000 gal. steel tank.
Installed 500 services.
Purchased Hunt Club main.
Installed Venturi meter.
The entire works were designed and constructed under the supervision of James, Proctor & Redfern, Ltd., consulting engineers, Toronto.

UTILIZATION OF WHITE COAL FOR HEATING PURPOSES

By A. Langlois

SO far, according to results obtained from experiments conducted in certain countries of Europe, particularly in France, Italy and Switzerland, it is shown that a substantial gain may be obtained in using electricity derived from hydraulic power for the production of steam, as well as its transformation into motive power. The coefficient of utilization of the potential energy of the coal is about 60%, whereas the energy obtained by the use of electricity is about 66%, adding to this that the loss in the production of steam by electric heating is less than by coal.

France is just about to decide on the expenditure of several hundred millions of dollars to completely develop the powers of the Rhone River from the Swiss frontier to the sea, one of the main objects of the scheme being to conserve the coal for industries which cannot operate otherwise. It is said that 1,800,000 h.p. will be available from the Rhone water powers, and which when developed will mean an economy to the country of from 50 to 60 million tons of coal every year, economy in the material as well as on the cost of the production, about \$15,000,000 annually, and to this it is expected to add a saving of over \$20,000,000 more in the use of electricity instead of gas, oil, etc.

In that connection, our country has an immense wealth in store providing, however, that a sound policy of exploitation is designed, in order to make use first, of such water powers which may be developed most advantageously. Canada possesses enough reserve of water power to meet all demands for a great number of years to come, if we compare the amount of power available, some 18,000,000 h.p. at the minimum flow, of which hardly 10% are yet utilized. If the cost of a hydro-electric installation is expensive, the source is inexhaustible through use and with proper development and conservation the yield will never fall.

The present value of the Ottawa Electric Railway lines and equipment within the Province of Ontario and necessary for the operation of the system is \$4,110,922, according to the value set by the Hydro-Electric Power Commission of Ontario.

Building figures for Windsor, Ont., for 1921 show an increase of \$123,270 in value and 100 permits, according to the annual report of Building Inspector Parker. In 1920, 1,109 permits were applied for, the value of which were estimated at \$4,850,010. Last year values jumped to \$5,078,280. This included approximately \$2,000,000, the estimated cost of the new Prince Edward hotel, now nearing completion, and the new police building, and Victoria Avenue Public School.

HYDROGEN-ION CONCENTRATION IN WATER PURIFICATION

Subjects of Coagulation and Filtration Should be More Thoroughly Studied in Light of More Modern Chemical Theories

By Harrison P. Eddy

Metcali & Eddy, Boston, Mass.

THE term Hydrogen-ion concentration, for short written also "H-ion" and "PH," may with sufficient accuracy for popular purposes be paraphrased concentration of acidity or alkalinity, as the case may be. Pure water is neutral, that is neither acid nor alkaline, and its hydrogen-ion concentration is taken at 7. Acidity is designated by numbers below, and alkalinity by those above 7.

The acidity or alkalinity of a liquid has thus far generally been reported in terms of total quantity of acid or alkali present. It has commonly been determined in water by adding acid, or alkali of known strength in sufficient quantity to neutralize the original acidity or alkalinity, the neutral point being indicated by a change in color due to a small quantity of organic dye previously added. But the action of the acid is not due solely to its total quantity but rather to its effective quantity or intensity. The essential difference between this old determination and the new hydrogen-ion method is that the latter shows the intensity, or true acidity, rather than the total quantity of acid.

The function of alum used in the process of water purification is to produce a coagulum, or floc, of relatively large size capable of absorbing or enclosing the finely divided foreign substances which cannot be removed by practicable periods of sedimentation or by filtration at high rates. When absorbed by the alum floc, however, they may be removed readily by sedimentation or by filtration, or by both processes jointly. It is obviously important that the alum introduced into the water be converted into floc as completely as possible.

Why Aluminum in Two Forms is Present in Treated Water

It has generally been supposed that the precipitation of the sulphate of alumina is dependent primarily upon the presence in the water of sufficient alkali and that any excess of alkali likely to be present in waters generally used as sources of water supply is not disadvantageous. However certain experiments indicate that there is an optimum point at which apparently all of the aluminum is thrown out of solution, but that above that point on the side of alkalinity or below on the side of acidity, precipitation is not complete. This offers a plausible explanation of the presence in the water being treated with aluminum both in insoluble and soluble form at the same time and of frequent occurrence of dissolved aluminum in filtered waters. It certainly indicates that it may be highly important, if practicable to carry out the coagulation process at the optimum point of alkalinity—the isoelectric point. Without this determination, or its equivalent, it is impossible to know whether the water has the proper PH. It may be too low or too high for complete precipitation and it will probably only occasionally be just at the optimum point.

The presence of aluminum in two forms is explained by some according to the theory that the alum assumes a colloidal condition, by which is meant a condition intermediate between solution on the one hand and suspension on the other. Thus we may speak of salt dissolved in water, as a solution, and sand or fine silt suspended in water, as a suspension. The soap in soapy water may be taken as a popular illustration of the intermediate conditions—that is, the soap is a colloidal. Some substances, like the alum used in purifying water, may be in, or be changed into, any one of these three conditions. The change is one of condition rather than of composition.

Another theory is that the alum may exist as different chemical compounds some of which are soluble and others insoluble.

Whichever of these theories may be accepted, the important point is that the alum can be converted completely

into insoluble aluminum hydrate only within a narrow range of hydrogen-ion concentration, which is not indicated by the methods commonly used for determining alkalinity, and that either above or below this zone the aluminum or a portion of it, may be present in solution.

A New Step in Water Treatment

It follows, therefore, that it is as important to reduce an alkalinity which is too high as to increase an alkalinity that is too low. This introduces a step in the process of the treatment of water, which is not common and which may prove of material value.

It is hardly necessary to point out the fact that the hydrogen-ion concentration appertains to the condition of the water for satisfactory coagulation and is not a method for determining the quantity of coagulant required. This must be done as an entirely independent step in the process.

For ascertaining the isoelectric point the determination of the hydrogen-ions affords a convenient and practical means. This may be accomplished in a manner similar to that long used for the determination of the total quantity of acid or alkali present. Thus by the use of several indicators constituting virtually a scale of indicators and by the addition of the proper quantity of alkali, or other compound it is possible to bring the water to the exact hydrogen-ion concentration required for complete precipitation of the aluminum from the alum added to the water. Theoretically this may be so minutely controlled in practice as to prevent the occurrence of dissolved aluminum in the presence of the insoluble aluminum floc.

As the conductivity of water varies according to its hydrogen-ion concentration this value may be determined by means of electrical apparatus which indicates the relative conductivity of the water under examination.

Steps for Control of Chemical Treatment to Take Advantage of "PH."

In order to take advantage of the hydrogen-ion concentration in the operation of a water purification plant it will be necessary to control the chemical treatment according to several steps, such as

1. Determine the quantity of alum required for successful treatment under conditions prevalent at the time.
2. Determine the P.H. of the water to be treated.
3. Determine the quantities and kinds of chemicals to be introduced, in order to bring the water to the isoelectric point for coagulation of the aluminum.

The procedure, then, would consist of adding the proper kinds and quantities of chemicals to produce the isoelectric point and the required quantity of alum for the successful treatment of the water.

The quality of most raw waters varies from time to time—often materially within very short periods of time. This variation may be in bacterial content, organic matter, numbers of micro-organisms, turbidity, temperature, or in all of these. It is obvious, therefore, that the quantity of alum must be varied to meet the conditions at the time. It is highly probable, also that the PH varies greatly and that the kinds and quantities of chemicals used to produce the isoelectric point must be varied accordingly. Even if the PH of the raw water remained constant, the necessary changes in the quantity of alum introduced would make it necessary to vary the chemicals required for producing the isoelectric point, as this condition must be fixed with reference to the quantity of alum used, or in other words, if coagulation is to be complete the water must be at the isoelectric point after the sulphate of alumina has been added.

It has been suggested that the PH of the water be determined and the application of the conditioning chemicals regulated automatically by electrical apparatus. Such equipment would greatly simplify the control of the process.

Possible Advantages from PH Control of Purification Plants

Among the advantages which may possibly result from PH control of water purification plants, may be mentioned the following:

1. Prevention of passage of alum through filters and after-precipitation in mains: The passage of alum either in solution, or as a colloid, through water filters has long been recognized as one of the defects of the alum treatment. Such water is not satisfactory for domestic consumption and is objectionable for certain industrial uses, such as dyeing. It may be possible by chemical treatment to so adjust the PH as to secure complete precipitation of the alum and prevent its passage through the filters.

2. Prevention of corrosive action: It is possible that the treatment of the water to secure the isoelectric point, will reduce the danger of corrosive action by the filtered water, due either to the presence of dissolved aluminum sulphate or to excessive carbon dioxide. The treatment required to produce the isoelectric point in some cases (where acid is required) might not reduce—in fact, it might actually increase—the amount of free carbonic acid present in the water. It does not follow, therefore, that in all cases advantage can therefore, that in all cases advantage can be taken of reduction of both of these corrosive substances, although it may be possible to so adjust this treatment as to accomplish this. It is conceivable and has been suggested, that in practice water treated in this manner might become more highly corrosive than that treated in the ordinary way.

3. Control of small plant and animal life: It has long been known that the growth of microscopic organisms and bacteria is favored by the concentration of acidity, within certain limits outside of which there is an inhibiting effect. It has been suggested that by securing the optimum PH for precipitation of alum, the environment of such organisms may be so changed as to prove detrimental to them and inhibit their growth. There is scarcely any definite information on this point and it is included herein merely as a suggestion of possible means of controlling growths in filter plants, which in some cases have been quite troublesome.

4. Possible reduction in size of filter plant: It is a matter of common knowledge among chemists that precipitates formed under certain conditions settle and filter much more readily than those formed under other conditions. There seems to be ground for the belief that alum precipitated at the optimum PH point may form a floc which will settle more readily and permit of more rapid filtration than similar floc formed at a less favorable PH. Should it prove that coagulation at the isoelectric point will produce a floc which will coagulate and settle more readily and permit of a higher rate of filtration, a corresponding reduction in size of coagulation basins and filters might prove a substantial advantage. While it is conceivable that the change in the character of floc, due to PH control, might warrant a change in the depth of filtering material or in some other detail of construction, this does not appear at all probable.

5. Possible increase in efficiency of operation: If coagulation at the isoelectric point will result in the formation of a better floc and in avoiding the passage of dissolved aluminum through the filters, it may be that the bacterial efficiency of filtration will be improved to some extent. It seems reasonable to expect such a result from observation of the process of coagulation.

While these and perhaps a number of other advantages of the PH control may be possible from a theoretical point of view or may be obtained in the laboratory, it is important to prove to what extent, if any, they can be secured in the practical operation of water purification plants.

There is little doubt that the determination of the hydrogen-ion concentration will permit of a more intelligent study of the water and the reactions taking place during its treatment. This fact alone is sufficient to warrant making a thorough investigation of the subject and determining the PH value in many cases.

It is impossible that the methods of control now in use, based in part upon the older conceptions of the chemistry, involved and in part upon practical operating expenses, permit of as close operation of purification plants as it is possible to obtain, even with the assistance of the more delicate and refined hydrogen-ion determinations made in accordance with the latest theories of chemistry.

It often happens that empirical methods lead to practical results which are as satisfactory and effective as those based upon more accurate knowledge. This fact, however, does not justify disregard of progress in science and of new theories. It cannot be gainsaid that the older practitioners in any profession, or in the arts, are inclined to adhere to the older methods and processes as a result of their familiarity and experience with them and a natural reluctance to adopt new ideas. The older members of the profession should constantly guard against this tendency, in order that valuable improvements may not be ignored, simply because they involve new discoveries and new theories.

While it is wise to give proper weight to the reasonable doubt of success in order not to be misled by theoretical consideration, it is certain that the subjects of coagulation and filtration should be very thoroughly studied in the light of the more modern chemical theories. Such investigations will lead to a better understanding of the chemistry of coagulation than that which has governed this important subject in the past. With improved conception of the process advantages of more or less importance are likely to follow. The true value of the hydrogen-ion determination can only be learned through investigations covering a great variety of conditions encountered at a large number of plants.

Such investigations may well lead to a restudy of the whole subject of chemical treatment of water and improvements may result in lines entirely apart from the hydrogen-ion determination, which furnished the initial incentive for such further study. Paper read at the New England Water Works Association Convention, Sept. 15, 1921.

FRENCH TIDAL POWER SCHEME

THE construction of a tidal power-station on the estuary of the Diouris, a small stream which enters the sea at Aber Vrac'h, in Finistere, about 15 miles north of Brest, is proposed by the Societe Financiere pour l'Industrie.

The plans involve the construction of three reinforced concrete caissons in the middle of the estuary, together 70 metres wide. The largest, in the centre, will contain the turbines; its bottom will be 13.20 metres below standard water-level, and its top 12.80 metres above, or 4.30 metres higher than the level of spring tides. Flanking this caisson on each side will be two smaller ones, to contain sluices. The caissons will be connected to each shore by masonry walls, giving the barrage a total width of about 150 metres. A lock will permit the passage of ships.

The turbines installed in the central caisson will be of the Escher Wyss type, designed to generate while running in either direction, to block the passage completely or act as sluices, and to operate as pumps. On a rising tide the water will flow from the sea into the inner basin through the turbines, and when the level of the water is the same on both sides of the barrage, the turbines will be stopped, until with the ebbing tide the level of the sea falls sufficiently to enable them to be operated again with the water from the basin. In addition there will be a second reservoir, constructed on the Diouris just above the limit of the tidal range, to feed a second generating station. It is estimated that the tidal turbines will supply about 7,900,000 kw. hours, of which the industrial load will absorb 5,500,000 kw. hours. The surplus will be employed in pumping water into the upper reservoir, the station in connection with which will furnish 3,900,000 kw. hours.

Co-operation between the police officials and the safety committee of the city of Hamilton and the Chamber of Commerce is needed to overcome conditions here. It was pointed out by interested council members recently when announcement was made that Magistrate Jelfs had practically disregarded the safety zones, stating in effect that people waiting for cars should stand on the sidewalks. The city intends to either have the zones respected by the court and motorists or do away with them entirely.

ENGINEERING STANDARDIZATION

Progress of Standardization in Europe and America Outlined
in Address Before Engineering Section of American
Association for the Advancement of
Science, at Toronto

By R. J. Durely

Secretary, Canadian Engineering Standards Association

ACCORDING to Webster, a "standard" is "that which is established as a rule or model by authority of public opinion or by respectable opinion or by custom or general consent." Standards in engineering work, in conformity with this definition, are thus the result of agreement as regards dimensions, methods of construction, or qualities of material, such agreement being entered into by producers and purchasers for their mutual advantage.

The aim of engineering standardization as we understand it, is to secure this agreement between producers and purchasers in order to effect economy and improve engineering material by eliminating unnecessary sizes and types of parts, or grades of material, or methods of testing for acceptance, by securing interchangeability of parts, lessening the expense of production, and protecting the purchaser by ensuring standard quality.

Basis of Expressed Need

It is important to note that the inception of such standardization work should result from a strongly felt need on the part either of the manufacturers or the purchasers, and it has been found advisable by practically all of the existing standardization bodies to arrange that work on a given subject shall only be undertaken on request from some responsible party. The essential features of the work are, therefore, expression of the need, full discussion between all parties interested, thorough investigation of the problem, the formulation of definite proposals, their criticism by the industries concerned, their amendment and final adoption by an authoritative central body.

The active support of the industries concerned is indispensable and any idea of the compulsory introduction of certain standards is quite foreign to the scheme. Periodical revision is necessary to keep abreast of progress and care must be taken to avoid any decisions tending to limit freedom and individuality in design. From time to time when questions of engineering standardization are being considered it is objected that the proposed action may have the effect of stereotyping the product, thus hindering, rather than facilitating, progress and economy. There would be some force to this objection if, for instance, standardization work were carried so far as to endeavor to get all firms to build to the same design in the case of a complete machine, or if there were no provision for periodical revision of standards, as a rule it is the details that are standardized. There are, nevertheless, cases where the general features of certain types of machine have been standardized with advantage. An example of this arises in the case of the series of standard types of locomotive which have been adopted for the various railways in India.

Scope of Standardization

In Canada, as in some other countries, popular uncertainty seems to exist as to the meaning of the term "Standardization," some taking it as referring to the work considered in this paper, namely, the preparation of such design, dimensions or specifications in industrial manufacturing and construction work as will be generally accepted and worked to by all concerned, and others taking it to mean only the work of measuring, calibrating, or comparing scientific instruments, measures of length, etc. The latter use of the word covers, of course, the very important work carried on by such bodies as the International Bureau of Weights and Measures or the Bureau of Standards, but work of this kind does not come within the scope of the engineering standardization bodies dealt with in this paper, nor do these bodies as a rule deal with the formulation of standards which require endorsement by legislative action.

The economic and industrial significance of industrial standardization has been well pointed out by Dr. Agnew, who, in a recent address on the subject, makes the following clear statement:

"If standardization is carried out on a sound engineering basis:

1. It enables buyer and seller to speak the same language, and makes it possible to compel competitive sellers to do likewise.

2. In thus putting tenders on an easily comparable basis, it promotes fairness in competition, both in domestic and in foreign trade.

3. It lowers unit costs to the public, by making mass production possible, as has been so strikingly shown in the unification of incandescent lamps and automobiles.

4. By simplifying the carrying of stocks it makes deliveries quicker and prices lower.

5. It decreases litigation and other factors tending to disorganize industry, the burden of which ultimately falls upon the public.

6. It eliminates indecision, both in production and utilization — a prolific cause of inefficiency and waste.

7. By focusing on essentials, it decreases selling expense, one of the serious problems of our economic system.

8. By concentrating on fewer lines, it enables more thought and energy to be put into designs, so that they will be more efficient and economical.

9. It stimulates research, to which it is closely allied.

10. It is one of the principal means of getting the results of research and development into actual use in the industries.

11. It helps to eliminate practices that are merely the result of accident or tradition, which impede development.

12. By concentrating on essentials, and the consequent suppression of confusing elements intended merely for sales effect, it helps to base competition squarely upon efficiency in production and distribution, and upon intrinsic merit of product."

The intimate connection of engineering standardization work with research should be emphasized, for in almost every case it will be found that during the process of developing or formulating all engineering standard, technical or scientific questions will arise which can only be settled by investigation and research, the information gained in which is frequently of the greatest possible benefit to the industry concerned.

Standardization in Great Britain

The British Engineering Standards Association was the first central body to be established for the work of engineering standardization. It was founded in 1901, one of its earliest tasks being to obtain agreement and reduce the number of unnecessary sizes as regards standard sections of structural steel and rails as produced in Great Britain. The B.E.S.A. has now published nearly 150 reports and specifications covering practically the whole field of engineering work, and its standards receive wide acceptance in Great Britain. The subjects dealt with, for instance, include such varied items as cement, rolling stock material, forgings, electric meters, locomotives for Indian Railways, incandescent lamps, electric cooking ranges, ball bearings, and a host of others. Since 1917, its activities have developed rapidly and the scale of its operations is now such that it has over 300 working committees with nearly 2,000 members. During the war the B.E.S.A. was able to render important technical service especially in connection with naval and aircraft work. It was, for instance, called upon by the Air Ministry to organize committees and frame a series of specifications for aircraft material, which work was successfully carried out. In doing this, a large amount of research was initiated, especially in connection with novel methods of construction, the action of glue in glued joints in ply wood, and innumerable questions connected with fabric for aeroplane wings and the action and kind of dope.

The affairs of the B.E.S.A. are directed by its Main Committee, composed of members nominated by the great technical societies which support the association, as well as certain other co-opted and ex-officio members. The Main

Committee appoints Sectional Committees, dealing with various divisions of engineering work, and the sub-committees on which producers and purchasers are directly represented and which carry out the actual technical work of formulating the various standards. These are, of course, approved by the Main Committee before publication.

An interesting feature in the work of the B.E.S.A. is the series of local advisory committees, established in Brazil, Chile, Argentina, India, South Africa, China and elsewhere, keeping the parent association informed as to the industrial needs which develop in the various countries and advising as to the suitability or otherwise of British standards for local use. The C.E.S.A., though a completely independent body, has undertaken this duty as regards Canada.

Progress in the United States

In the United States, the movement began about the same time as in Great Britain, but was carried out directly by important technical societies like the American Institute of Electrical Engineers and the American Society of Mechanical Engineers, the former of which began its standardization work in 1898. In 1918, more than 100 American technical societies were engaged independently on engineering standardization work, but there were no systematic methods of co-operation and in that year the American Engineering Standards Committee was organized to unify the methods adopted, to secure united action, and to avoid over-lapping, serving also as a central source of information and dealing with questions of international standardization. The A.E.S.C. is composed of representatives appointed by the member bodies; it does not itself prepare standards, but receives and adopts those formulated by various sponsor societies. Its activity has led to rapid development in many directions, especially in connection with safety code work.

The American Engineering Standards Committee itself, usually referred to as the Main Committee, is composed at present of 47 members, representing 17 member-bodies. The Committee does not duplicate the work of other organizations. On the contrary, in acting as a clearing-house for standardization, it eliminates duplication, as very substantial results have already shown.

The Main Committee is solely an administrative and policy-forming body, and does not pass upon the technical details of standards. The formulation of a standard is in the hands of a working committee, technically called a "sectional committee," made up of representatives designated by the various bodies interested. The Main Committee must approve the personnel of each sectional committee, as being authoritative and adequately representative of the various interests concerned. Producers, consumers, and general interests are to be represented on every sectional committee dealing with standards of a commercial character.

European Standardization Developments

On the continent of Europe, national standardization bodies have been organized in Belgium, France, Germany, Holland, Austria, Czechoslovakia, Italy, Norway, Sweden, and Switzerland. Action along the same lines is being taken in Australia, and Japan has just appointed a Standards Committee as one of its government departments, in this respect following France. In all other countries than France and Japan, the standards committees are voluntary organizations, enjoying, however, a larger or smaller amount of government support.

The Association Belge de Standardisation (A.B.S.) was formed in 1919 under the auspices of the six large engineering associations in Belgium. The delegates of the supporting institutions form its general committee and the standards drawn up by its technical committees are published in draft form for criticism before adoption. Up to date seven publications have been issued, the most important of which are specifications for steel structural work and bridges, and standard requirements for electrical machinery.

In France, the national standardizing body is the Commission Permanente de Standardisation (C.P.S.) a body appointed by and working under the Ministry of Commerce and Industry. The Commission is assisted by the work of

the necessary competent technical advisers with whose aid it prepares projects or proposals for standards, which are submitted to public criticism, and which, after amendment and approval, are definitely adopted as French standards. These standards are obligatory for use in connection with all government contracts, and the scope of the Commission's work includes not only mechanical questions but also those relating to materials and rules for construction. Up to September, 1921, the French Standards Committee has issued upwards of thirty standard specifications.

Standardization in Germany

The amount and quality of the work done in Germany calls for special notice as the standardization movement in that country appears to have the support and interest of industrial associations and manufacturers to an extent which has hardly been approached elsewhere, even in Great Britain or the United States.

Prior to the war, a good deal of electrical standardization work was carried out in Germany by the Society of German Electrical Engineers, but it is understood that the stress of war conditions led to a great development of this work and its extension to other fields of industry, and ultimately, in December, 1917, to the foundation of the Standards Committee of German Industry (N.D.I.) which was organized to serve as a central body for the issue of engineering standards of all kinds.

The German Standards Committee has carried on its work with great activity, having, since 1917, issued some 150 sheets of approved standards, while over 500 sheets have reached the stage of being published for criticism. The German Standards Committee has, as its members, Government departments, technical and industrial societies, the great engineering schools, and also private firms, all these subscribing to its funds. Its Main Committee is made up of representatives nominated by the member organizations and is charged with the general direction of policy and the approval of published standards. The actual executive work is entrusted to an executive committee of twelve members. The German Standards Committee maintains a very complete office organization, having an adequate engineering and technical staff, as well as some thirty other employees in the business office. Great stress is laid on the importance of having a central technical office so that working committees may be relieved as far as possible from the detail work of drawing up the various proposals, collecting information, and putting it in shape for consideration. The central office also takes care of secretarial work and deals with questions relating to finance, publication and the sale of published standards.

An interesting feature of the German work is the co-operation with the N.D.I. of the various important technical associations such as the Society of German Electrical Engineers, the Society of Merchant Shipbuilders, etc., these Associations, in many cases, maintaining their own standards committees for working purposes, but publishing their work through the agency of the N.D.I. and retaining close connection with that body in all cases. In this way, it seems that overlapping and duplication of work is practically avoided, while the interest of the members of the industrial associations in standardization work is effectively stimulated.

Very complete arrangements are made with regard to the publication of German standards, there being available for this purpose a periodical or magazine dealing with production engineering and issued by the Society of German Engineers, in which all proposed standards are published for criticism before being finally approved. No small portion of the work of the technical office consists in the reception and consideration of these criticisms and the incorporation of the necessary amendments in the various proposed standards.

As an evidence of the wide-spread interest of industrial Germany in standardization work, it may be noted that over seven hundred firms are subscribers to the funds of the German Standards Committee, and their business office deals with 1,500 pieces of mail per day.

While it has been found necessary to withdraw and amend a number of the standard sheets, it appears that the majority are adopted and worked to by the leading firms of the country.

Activity in Holland

In Holland the Main Committee for Standardization in the Netherlands was organized in 1916 by the Society for the Promotion of Industry and the Royal Institute of Engineers. Its general organization includes an executive committee, the necessary working committees, and a central standardization office, whose staff comprises the necessary technical and business employees for the effective carrying on of the work of the committee. The committee is supported partly by grants from the Dutch government, and partly by a fund to which many of the large industrial and engineering firms have liberally subscribed.

The Dutch committee lays particular stress on the necessity for thorough criticism of proposed standards before their adoption, and when tentatively approved by the Main Committee, proposed standards are published for this purpose in the Dutch technical periodicals, interested parties being requested to forward such criticism or suggestions as they think advisable. At the expiry of a specified time, the criticisms are considered by the working committee which has prepared the standard, which is amended, if thought proper, and is again sent out to the Main Committee for definite approval and publication.

The work of the Dutch Standardization Committee, like that of the German committee, has so far consisted very largely in the formulation of dimensional standards for engineering work. At the present time seven working committees have been formed, dealing with rivets, bolts and nuts; technical drawings; sizes of paper; methods of lettering; tolerances on cylindrical fits, and screw threads, gearing, shafting, keys, bearings, etc.; cable fittings; sewer pipes; and ship details. Up to May, 1921, 43 standard sheets had been published.

Swiss Standardization

In Switzerland, standardization work was begun in 1918 by the Association of Swiss Machinery Manufacturers (V.S.M.), its standards committee being them intended to deal primarily with mechanical and electrical work. This committee established a practical working organization, but soon saw that the standardization field should not be limited to mechanical and electrical work and, as a result, the Swiss Standards Association (S.N.B.) was organized in January, 1921. This association is a union of some twenty-seven technical and industrial associations and federal institutions, including the Association of Swiss Machinery Manufacturers, the Swiss State Railways, the Swiss Association of Electricians, the Swiss Boiler Owners' Association, the Swiss Society of Engineers and Architects, the Swiss Iron Foundries Association, and other similar bodies. The work so far accomplished in Switzerland has naturally been mainly the result of the activities of the Association of Swiss Machinery Manufacturers although the more extended standardization work of the Standards Committee may soon be expected to develop.

The conditions in Switzerland are of special interest to us in Canada, as, owing to their geographical location and economic situation, Swiss manufacturers are compelled to consider carefully, and adopt in many cases, the standards of neighboring countries. The industrial relationship, for example, between Switzerland and Germany is very similar to that which exists between Canada and the United States. Questions of international agreement are, therefore, of particular importance in Switzerland, and the representatives of the Swiss Standards Committee have been specially active in advocating international agreement in standardization affairs and are keeping in constant touch with the other national standards committees or associations.

In Italy, Norway, Sweden, and Czechoslovakia, while a commencement of the work has been made, development has not proceeded sufficiently far to enable a detailed description of the organization to be given. In each case, however, considerable activity is being displayed.

Work of the C. E. S. A.

As regards Canada, the formation of the Canadian Engineering Standards Association in 1918 took place as a result of suggestions put forward from the British Engineering Standards Association, and its constitution follows generally that of the B.E.S.A. The general policy of the association is directed by a Main Committee of 43 members prominent in industrial and scientific work; sectional committees are appointed, each dealing with one of the main divisions of engineering work and the actual technical work of the association is accomplished by sub-committees each dealing with some one specific task. There are at present ten sectional committees and over twenty sub-committees and panels are engaged in the discussion of the standards which are in preparation. The association is supported by subscriptions from technical societies and firms interested, together with a grant from the Dominion government.

The following publications have been issued by the association:

- No. 1 -1920 Standard Specification for Steel Railway Bridges.
- 1a-1920 Do. (Separate reprint of Material Specifications.)
- 2 -1920 Standard Requirements for Distribution Type Transformers.
- 3 -1920 Standard Specifications for Galvanized Telegraph and Telephone Wire.

The following are in preparation and will shortly be issued:

- Standard Specification for Steel Highway Bridges.
- " " " " Railway Bridges (new edition.)
- " " " " Wire Rope for Mining and Dredging Purposes.
- " " " " Portland Cement.

In order to indicate more clearly the method by which an engineering standard is actually developed, it may perhaps be of interest to take the case of galvanized telegraph and telephone wire, which has recently been dealt with by a sub-committee of the C.E.S.A.

A request from one of the largest manufacturers of this material was placed before the Main Committee in 1919 and indicated that line-wire was being purchased in Canada to a large number of specifications differing very slightly amongst themselves but varying to such an extent that it was impossible for wire rods to be rolled or for wire to be drawn for stock with the certainty of being acceptable to more than one of the large telephone or telegraph companies. It was pointed out that if two or three grades of this material could be agreed upon as fulfilling Canadian requirements, considerable economy would result and material could be promptly obtained from stock. A sub-committee was accordingly appointed to deal with the question, of which representatives of all the manufacturers and all the telegraph and telephone authorities were members. After a preliminary comparison of the existing specifications and the preparation of a draft for criticism, two meetings of the committee were held at which it was agreed that the C.E.S.A. specification for galvanized line wire should cover two qualities of wire and five sizes in each quality. The resulting specification was approved for publication in February, 1921, and is receiving general adoption. The saving resulting from the complete adoption of this specification by all concerned is estimated at from 75c to \$1.00 a ton on an average consumption of eight to ten thousand tons per year.

In the spring of 1921, an important conference of secretaries of the various national standardizing bodies was held in London, at which information was interchanged regarding the methods of work and activities in the various countries represented and a number of points were informally discussed regarding possible lines along which international standardization may be possible. It was felt, however, that international agreement, however desirable, must be approached by slow degrees, although there is every reason to hope that before long, effective action will be found possible in connection with certain important subjects.

SEWAGE GAS AS MOTIVE POWER

By John D. Watson, M. Inst. C.E.,

Engineer to the Birmingham, Tame and Rea District Drainage Board

THE ever-increasing need for power on sewage purification works, the present cost of fuel, the persistent demands for economy, and the salvage of waste products are all influences which compel exhaustive inquiries into every possible source of power.

The object of this paper is to suggest a source hitherto overlooked or minimized, and to describe experiments and experiences which are calculated to stimulate further inquiries into the possibilities of utilizing the marsh gas which is formed by organisms acting upon decaying vegetable and other organic substances.

When the annual meeting of this Institution was held in Birmingham two years ago, the author read a paper on the utilization of sewage sludge, describing in some detail the intensive fermentation process adopted on the Birmingham works in order to render the vast quantities of sludge inoffensive without destroying its fertilizing properties or lessening the calorific value. In that paper comparatively little was said about the gas evolved by the fermentation process beyond making reference to the marked differences between crude sewage sludge before it enters upon the septic or putrefactive stage and the sludge after it has reached that stage. Illustrations were given to show that sludge during the digestion process is lighter than water, but what at first sight appeared to be a reversal of the law of gravitation is a delusion—it is merely an instance of solid matter being held up by gas formed in the course of the putrefactive change which takes place when organic matter is acted upon by bacteria and their enzymes. It was shown how sludge in this condition was more easily pumped than fresh sludge; friction in the process of forcing it through a cast-iron main 5 miles in length was lessened. When the main referred to was first laid difficulties were anticipated which were not realized in practice. It was assumed, therefore, that the comparatively frictionless propulsion of solids through the main was probably due to the reduced density of sludge and to an innumerable number of gas bubbles acting like so many ball bearings between particles of solids, thus tending to reduce the viscosity of the sludge.

It is now proposed to refer to the nature and power of this gas, and to give illustrations of what it can be made to do when under control, for it is possible to harness this veritable will-o'-th'-wisp if the conditions are understood and taken advantage of in a scientific manner.

More than a quarter of a century ago gas generated in Cameron's covered septic tank was drawn off and employed in the Exeter sewage works.

In the beginning of 1920 the author visited the Matunga leper asylum at Bombay, where a small engine had been driven by sewage gas by Mr. James as far back as 1907.

In both these cases the gas was generated in closed septic tanks which favored the cultivation of the anaerobic organisms, and in the latter case the climate was specially favorable. But the work done more recently by Mr. Walshaw at Paramatta in Australia, under what he terms aerobic conditions, is much more remarkable—indeed, it was knowledge of this case coming immediately after his Indian experiences which induced the author to try whether it was possible to obtain equally successful results in this changeable, unreliable climate of ours.

Cole Hall, Birmingham, Plant

The opportunity of making a test at Cole Hall presented itself, and the drainage board, who had some years previously approved plans for driving the pump there by a suction-gas engine, consented to the scheme being carried to admit of a sewage-gas plant being substituted for the suction-gas plant.

It will be observed from the diagrammatic section how very little alteration was required to meet the changed conditions, and how little expense was incurred in defraying the cost of the experiment.

The plant is designed to give a 25-b.h.p. for a working period of six hours per day. It comprises a 34 (max.) h.p. horizontal gas engine of the ordinary suction type, made by the National Gas Engine Company, Limited, a 5-in. centrifugal sludge pump made by the Unchokable Pump Company, a small sludge pump well, and a sludge digestion tank in two sections constructed of cement concrete. There yet remains to be erected a small gasholder, without which it is impossible to keep the engine running for more than an hour and a half or two hours consecutively.

It will be seen from the diagram that the exhaust pipes for the engine are enlarged to 9 in. diameter, and made to pass through the digestion or generating tanks with the object of imparting heat to the sludge and so promoting fermentation, thus benefiting from the experience gained at Saltley, where for a dozen years it has been customary to inject live steam into the sludge during extremely cold weather. It will be observed, also, that provision is made for effecting an occasional disturbance of the mass by injecting compressed air, but this is not altogether satisfactory, as it interferes, to a certain extent, with the regulation of the mixture supplied to the engine, and arrangements will shortly be made to effect the desired disturbance by means of compressed gas drawn from the top of the sludge digestion tanks. This will also serve to mix the fresh charges of sludge.

The principal constituents of sewage gas are methane (CH_4), hydrogen (H), nitrogen (N), and carbon dioxide (CO_2), and it is upon the marsh gas, or methane, we chiefly rely.

Marsh Gas in Sewage: Analyses

The following statement gives the percentage by volume of marsh gas found in various septic sewages in England, America, Australia, and India;

	marsh gas
Exeter (Donald Cameron)	20.13
Exeter (Donald Cameron)	24.4
Matunga (C. C. James)	21.25
Matunga (C. C. James)	23.9
Lawrence (Mass. State Board of Health)	
Septic Tank A	79.0
Septic Tank B	37.5
Septic Tank F	75.9
Parramatta (Septic Gas Co. of Australia)	60.0
Birmingham (J. D. Watson, Aug. 1921)	60.1
Birmingham (J. D. Watson, Sep. 1921)	77.0
Birmingham (J. D. Watson, Nov. 1921)	67.5

The analyses of gas made in September and November respectively are as follows:

	Per cent	Per cent
Carbon dioxide CO_2	18.1	25.2
Hydro carbon HC	0.2	—
Oxygen O_2	0.4	0.3
Carbon monoxide CO	1.1	—
Methane CH_4	77.0	67.5
Ethane C_2H_6	trace	2.8
Nitrogen N_2	3.2	4.2
	100.0	100.0
B.T.U.'s per cubic foot	700	650

Results from such a wide selection of places in different parts of the world seem to indicate that marsh gas is evolved from organic matter as readily in one climate as in another, but in fact it is not so, and the results of the analyses show the need for more definite information and caution in their application. The results obtained by Mr. Rhead, chief chemist to the Birmingham Gas Department, in his analyses of the Cole Hall gas emphasize this statement.

The amount of gas from the total volume of available sludge which can be relied upon at Cole Hall is greater than the power demand there, but it is certain to vary with the seasons, and it is as sure to vary with the age, the volume, and the condition of the organic matter in the sludge. Steps are therefore being taken to investigate the facts with a view to preparing graphs which will show

(1) the volume of gas to be obtained from a given volume of average sludge (10 per cent dry solid matter) in a given time, (2) one which will show at what time the sludge gives off the maximum quantity of gas, and what time is needed to change that maximum into a minimum.

Probably the majority of the results given in the analytical table were obtained from septic sewage, but the

DIAGRAM OF EXPERIMENTAL PLANT

A—34 B.H.P. Gas Engine, B—Centrifugal Sludge Pump, C—Sludge Pump Well, D—Gas-generating tanks, E—Gas holder, F—Compressed gas tank, J—Compressed air for starting engine, H—Cooling tank, J—Relief valves, K—Gas main, L—Supply pipes.

author is of opinion that it is from sludge and not from liquid sewage that gas can be obtained in sufficient volume to render its use economical. This statement is contrary to that put forward by Australian observers who claim that the best results can be obtained from aerobic treatment of sewage.

Up till now the sludge available at Cole Hall has been very watery (containing only 3 per cent dry solid matter). This was owing to the fact that the supply was temporarily dependent upon the ability of a land irrigation pipe laid on a very flat gradient to convey it from the outfall works to the engine house. By a new sludge main which will soon be completed a denser sludge (at least 10 per cent dry solid matter) will be conveyed to the tanks, thus reducing the volume of water which has hitherto entered the tanks, persistently lowering the temperature of the mass, and taking up space which should be occupied by organic matter which is capable of yielding gas. With a more concentrated sludge, it is evident that the gas forming material temporarily confined in the limited space should produce a greatly increased volume of gas (a matter of prime importance until a gasholder is provided as part of the installation), for it is necessary to impound surplus gas to be drawn upon when the demand by the engine exceeds the volume available in the digestion or generating tank.

Notwithstanding existing weaknesses in the experimental plant, the fact remains, that the engine has worked successfully and has given out the power required to drive the pump.

At Cole Hall, where the gas engine has been installed, the method of disposing of sludge has hitherto been quite

different from that obtaining in the main works in the Tame Valley. At the latter works the sludge is subjected to the fermentation process for the reasons enumerated two years ago, but at Cole Hall farmers buy it for agricultural purposes, and it is obvious that so long as it can be got rid of in this—the most satisfactory—way, there is no need to employ intensive fermentation. At Cole Hall, therefore, only sludge required to give off gas for power will be subjected to fermentation, and, judging from the limited experience available, it is estimated that about 2 tons of wet sludge (10 per cent dry, solid matter) per day will be required to provide an explosive gas capable of generating 25-h.p. for a working period of six hours per day. The amount of available sludge at Cole Hall is approximately 80 tons per day (10 per cent dry, solid matter).

The sludge, after it has been discarded, will probably be freer of fat and grease than it was before fermentation, and to that extent it will be more valuable to farmers than it was in its initial stage; moreover, it will still retain about 2 per cent of nitrogen after it has given off its methane, so that its fertilizing properties are not thereby exhausted, if indeed they are materially lessened.

Costs

Before emphasizing the fact that we have in marsh gas a useful power for driving an internal combustion engine, and that we have great volume of this gas in sewage sludge, there is the all-important question, Is it economical to use it?

It is obviously the business of the engineer to determine this, and he will require to take into account comparative costs of fuels, probable fluctuations in prices, the location of the works, transport facilities, effect of strikes on the supply of fuel, &c.

It was originally intended to put in a suction-gas plant, and although it is hardly time to make a comparison which can be relied upon, the following statement will be interesting, and may be helpful:

Annual Cost of Installing a Sewage-Gas Plant Compared With the Installation of a Standard Suction-Gas Plant

Duty—25 b.h.p. for daily period of six hours.

The cost of gas engine, engine house, pump and pump well being common to both plants is ignored in the comparison. The cost of labor, lubrication, and repairs is also approximately equal, and does not appear in the comparison.

Suction-gas Plant

Capital cost of suction-gas plant of similar capacity, £300.

	£	s.	d.
Annual charge on £300 at 10 per cent	30	0	0
30½ tons of anthracite at £3 per ton	91	10	0

(Allowing 1¼ lb. per b.h.p. hour)

	£	s.	d.
Cost of constructing generating tanks, with complete equipment of fittings, and allpewerk £600 at 7 per cent (repayable in 25 years)....	42	0	0
Provision for gasholder, £500 at 10 per cent (repayable in 14 years)	50	0	0
	92	0	0
Net annual saving in favor of sewage-gas plant	29	10	0

Essentials to Success

The following notes should be pondered by those who think of developing the Cole experiment.

Success in designing an installation is dependent on accurate information regarding (a) the percentage of sludge (dry, solid matter) which is capable of gasification, (b) the rate of evolution of the gas at various temperatures, and (c) the proportion of methane in the composition of the gas.

(a) Sludge, like sewage, is of diverse composition; much of its value as a gas producing substance depends upon the efficiency of the grit chambers and the amount of organic matter left in the sludge. There can be no doubt

that the gas comes from the decomposition of organic matter, and an inordinate proportion of inorganic matter would be a distinct hindrance, so would large doses of tarry and oily substances mixed up with the sludge lessen, if they did not entirely inhibit, the gas producing power of the putrefactive organisms.

Again, a modern sewerage system is designed to convey to a place of disposal almost every form of trade as well as domestic wastes, and water is the vehicle by which it is conveyed. That the fouled water contains organic matter is true, but obviously it is the sludge which is brought down with the water that contains the material from which gas is produced, so that the less liquid there is in sludge which is set aside for gasification the better. This, however, leads to a position where one may go wrong very readily. It is most difficult to obtain fresh sludge which contains more than 10 per cent of dry, solid matter, but the author has found to his cost that you may keep such sludge in a tank for a whole year without its undergoing the putrefactive change so essential to the production of gas. It is not enough, therefore, to set aside great volumes of organic matter; that matter must be introduced into a tank which has already been inoculated by the right organism, and it should not be introduced so rapidly that the organisms are smothered.

On the Sattley works where sludge is treated in order to deprive it of smell and its emulsive character, it is found to be advisable to mix the fresh material with about 20 per cent of "ripe" sludge when it is first transferred into a digestion tank; it is desirable also to maintain its temperature as high as possible with the view of providing those conditions which favor putrefactive change. Probably Dr. Travis's hydrolytic tank was the direct result of the desirability of doing this work recently. Dr. Imhoff, the German engineer, improved on Travis's tank and boomed it in America, where it has proved to be a very efficient instrument for separating fresh sewage from sludge which is kept designedly for months in order to convert it into an inodorous mass. The Birmingham method is better adapted to local circumstances, but the results are similar except that the Birmingham method is so arranged that it is possible to isolate sudden rushes of anti-septic liquor, a matter of considerable importance at times.

Another line of investigation essential to ascertaining the volume of gas which may be evolved from a given quantity of sludge is the influence of agitation. We know as a fact that disturbance of the mass is beneficial, but we are ignorant of the extent to which it should be carried. When a silt tank at Sattley fails to ferment, it is passed through the pump and distributed among what are termed ripe or healthy tanks. Breaking up the sludge as it passes through the direct-acting pumps effects a considerable change, but this side of the question requires further investigation, and what has already been done in Australia in this regard should not be overlooked.

(b) Temperature plays a very important part in the rate of evolution of gas and the volume extracted from a given quantity of sludge. In a sewerage district of 115 sq. miles, it takes so long for some sewage to travel to the outfall that it is mildly septic before it arrives there, but when the district is small the liquid portion of the sewage is for the time being almost free of putrefactive tendencies and will probably remain so throughout its treatment. The sludge, too, may take longer to septicize, but if treated under anaerobic conditions should be converted into gas in the quickest and most favorable way. We do not know the temperature at which the organisms will cease to act altogether, nor the temperature at which they will act most efficiently; investigation is required therefore if we would ascertain this one of the essential factors of the problem.

The composition of the sludge also should be considered when endeavoring to find out the rate of evolution of gas. Domestic sewage per se is probably better than any other for gas production, and some sewages, so far from containing putrefactive organisms possess qualities which sterilize those that emanate from domestic sources. Rushes of acid water, for example, affect whatever they come in con-

tact with. One of the Birmingham outfalls is so bad in this respect that in five months a new cast-iron centrifugal pump impeller is pitted all over and the extremities worn to fine points.

(c) The analytical constituents of the gas emanating from the available sewage sludge should be determined with accuracy. The figures in our possession are limited; so far they lead us to say that the gas contains from 60 to 77 per cent of methane, but with frequent determinations taken over a longer period it will be possible to give a more reliable figure.

Conclusion

Members of the institution having seen the installation at Cole Hall will appreciate the following abstracts of facts:

Ordinary suction gas engine	34 (Max.) b.h.p.
Duty of Engine	25 b.h.p. for 6 hours per day
Quantity of gas consumed per h.p.	20 cubic ft.
Estimated quantity of gas required per day	3,000 cubic ft.
Maximum duty of unchokable pump	450 gallons per minute against a head of 36 ft. at about 1,200 revolutions per minute.
Rising main	12-in. dia. Stanton Hume pipe.
Sludge capacity of generating tank	80 cubic yards.
Proposed capacity of gas holder	2,000 cubic ft.
Average proportion of methane in gas	60 per cent. to 77 per cent

The following observations on the working of the plant between September 6 and November 3 of this year, although varying in some respects with our original estimate, are of considerable importance:

Total amount of dry, solid matter passed through tanks	4 tons.
Average period of retention	6.4 weeks.
Average percentage of dry, solid matter in wet sludge	3 per cent.
(The plant now contains sludge having a proportion of 10 per cent dry, solid matter.)	
Estimated amount of gas consumed by engine	25,000 cubic ft.

The total gas yield is, of course, in excess of this amount, but it will only be possible to measure it when a gasholder is available. Under present circumstances a considerable quantity of gas is lost each time a recharge of sludge is made. A certain amount of gas has also been lost in making tests and minor alterations. A gas production of 25,000 cubic ft. from 4 tons dry, solid matter is equivalent to 1 cubic ft. of gas from .36 lb. dry, solid matter, or a gasification of 18 per cent of the total dry, solid matter. This is only 60 per cent of the amount of sludge gasified in open tanks in the Thame Valley.

In conclusion, it is worthy of remark that the fact which has influenced the author more than any other in following up this experiment consists in this: That 400,000 tons of wet sludge containing 27,000,000 tons of dry, solid matter is dealt with on the main works at Birmingham every year, and that as much as 9,000 tons of dry, solid matter is gasified. This is equivalent to 320,000,000 cubic ft. of gas. Paper read at a meeting of Municipal and County Engineers.

Building activity in Kitchener, Ont., during 1921 reached a total of \$932,050, a decrease of nearly \$200,000 from 1920. In this respect, it must be considered, however, it must be considered, however, that in 1920 the Y.M.-C.A. building and several large industrial buildings swelled the total considerably whereas this year \$494,800 or half the total was made up of residence permits to the number of 117. The total number of permits issued was 496.

TRANSPORTATION AND DEVELOPMENT OF MODERN CITIES

By Paul Seurot

Chief Engineer, Montreal Tramways Commission

THE solution of the transportation problem is especially difficult in the cities still at the period of evolution, cities in process of transformation and in which the population has not reached the saturation mark.

London and Paris, so essentially modern, are, however, very old cities which long ago reached their maximum growth and can only expand now by the annexation of ex-centric districts or of suburbs. The transportation problem consists, for those cities, in creating new extension lines to connect the central part of the city to these outlying suburbs in the shortest time. The changes to be made in the urban transportation of these cities will have in view mainly the improvements to be made in the rolling stock, the means to be adopted to accelerate the service, the curtailment of operating expenses practicable with a good service and the possible reduction of fares.

In such cities, the transformations are slow and have but little influence on traffic movements. Custom has assigned certain districts, certain streets to special classes of business and the migration of certain stores or shops towards new quarters is progressive and affects only a small number of customers whose movements in one direction or another is hardly appreciable, in so far as transportation is concerned.

In North America, in Canada particularly, the conditions are different. The large cities, there, are still in the period of evolution and of transformation. Some of these cities, until quite recently, were mere villages or only an agglomeration of wooden shacks hastily put together alongside a railway track, near a mine or a lumber mill.

Montreal itself which, with its surrounding insular territory, had but 330,000 inhabitants in 1900, reached 872,000 last year; and taking into consideration the large territories still unoccupied on the island of Montreal it is possible to foresee what will be the Canadian metropolis in twenty or thirty years.

Special Conditions in American Cities

The rapid growth of American cities has taken place under special conditions and might be compared to the forced growth, in conservatories, of plants, which, normally, would have reached their full development after a much longer time. The construction of railways has been the principal cause of this rapid evolution. In the over-populated countries of Europe, the railways had to follow well determined paths to connect cities permanently settled, and which they could only enter at specified points and under certain conditions and restrictions; this explains the elaborate approaches, bridges, viaducts or tunnels which had to be built in order that the railway construction should conform to the state and municipal regulations.

In America, the conditions were entirely different; a few industrial centres, usually at the confluence of navigable rivers, scattered over the continent, separated by large and usually unoccupied territories, centres which it was necessary to connect with one another. That is why, at the beginning, railways were laid along the path of least resistance, with cheapness and rapidity of execution in view, rather than durability and permanency. Along these railways, which were to become the great arteries of the American continent, were successively erected the warehouse, the general store, the hotel, a few residences, the factory, the church and in a short while towns came to life and expanded with a rapidity at which Europe marveled.

This is why, in so many American towns, can be seen rights-of-way in the middle of the streets, level crossings, sidings and shunting tracks across the main avenues or even along their axis and which are so many obstructions to local traffic and to the development of some districts, with the accompaniment of noise, dust and smoke.

This brought about, within the last twenty-five years, the reconstruction of the principal railways in the large

cities of the United States: the elimination of freight tracks from the surface of the streets, the grouping of the main approach lines, the elimination of grade crossings by depressing or elevating the tracks, the not infrequent amalgamation of the lines of different companies entering a city along the same right-of-way and having the same terminal, the "Union Station," the practical usefulness of which to the interested companies is self evident, and which puts at the disposal of the travelling public all the latest modern improvements, comforts and conveniences.

Interurban Transportation

In regard to interurban transportation, the old and permanently established towns have only to provide the lines that are necessary to serve the large centres of population and the principal streets. The levels are permanently established according to standard data, the pavements, the sewers and all municipal underground utilities have been installed and the tramways and the subways have only to conform to the regulations and to the conditions. The only things to determine are the number of lines to operate, the car service and headway for each hour of the day, the transfer points, the subdivision in zones, the economical haul, the time and the place when, and where, the subway or elevated structure becomes more advantageous than the auto bus or the tramway. The loading and congestion points are known and means to adequately and rapidly handle the crowds at certain hours can be devised in advance: in these cities, the population of which has already reached the point of saturation, the growth is constant and is not generally over 3%. The suburbs alone, which may still be in the period of evolution, are the unknown factors of the problem. These suburbs will have to be served by extensions or penetration lines which will effectively relieve the steam railways suburban traffic which is always an impediment to main line operation.

In cities still in the evolution or constructive period, the problem is more difficult to solve; the development of the means of transportation and the development of the city itself are not always simultaneous; in many cases, particularly during the periods, more or less hysterical, of real estate booms and wholesale lot subdivisions, street car lines, and even elevated lines or subways, are built long before the newly opened territories may be sufficiently developed to insure a precarious return upon the invested capital. In their estimates, the engineers and the financiers, as well, should take in consideration the probable increase in population to have a fair idea of the future density of traffic.

According to the theory of George P. Watkins, one of the statisticians of the Public Service Commission of the State of New York, theory based on former studies by Wellington, in his book on Railway Location, and by Matterns-dorf in Berlin, it appears that, generally, traffic, which at first increases directly in proportion with the population, increases more rapidly, and as the square of the population, as soon as transit improves in regard to speed, comfort, number of cars, even in these improvements require the opening of new lines or the construction of new means of transportation such as subways.

Transportation and Growth of Cities

It might be well here to see what bearing well planned new means of transportation may have on the development of communities. Taking the Borough of the Bronx, for instance, which became, politically, a borough of the city of New York in 1900, remained, until 1905, geographically separated from New York by the Harlem River and about 11 miles distant from the down town district which could be reached only after travelling for nearly an hour and a half.

In 1902, when the construction of the subway was started, the population of the Bronx, spread over an area of 40 square miles, was 230,000 and the real estate value recorded in the Tax Department was \$153,500,568. In 1905, when the east branch of the subway was opened, giving rapid and continuous transportation from the Bronx to South Ferry, the end of the line at that time, the population was 275,000 and the value of the real estate \$274,-

859,593, which shows that in 3 years, previous to the opening, but speculating on the benefits to be derived therefrom, the population had increased 20% and the real estate value 78%.

In 1911, six years after the opening of the subway, i.e. from 1905 to 1911, the population had increased 76% and the real estate value 120%; the former being 483,224 and the latter \$605,222,933. Compared to 1902 the population had increased 110% and the real estate value 294%.

Situation in Montreal

In 1912 the population on the island of Montreal was 600,000; in 1921 it was 872,000. In 1912 there were, on the Montreal Tramways 175 rides per annum et capita; according to Watkins' theory there should have been 369 revenue passengers per annum and per capita; there were only 218 during the last fiscal year. The same discrepancy appears if we take the transfers into account; the total number of rides per annum et capita was 230 in 1912 and 297 in 1920-1921, whilst it should have been 485 according to the formula established by Watkins, Wellington and Matersdorff.

We know, however, that until certain improvements have been brought in any transportation system the traffic is directly proportional to the population; therefore the rides per year and capita which were 175 in 1912 should have been 254 in 1921; they were only 218. The difference, however, is not so great if we consider that the last seven years were abnormal economically as well as in regards to immigration and population.

It would not be right, either to conclude from the above data, that is traffic has not increased more rapidly than in proportion to the growth of population it is because the service was not sufficiently improved to cultivate in the public what has been called the "riding habit."

The cause of this traffic stagnation is not due altogether to the economic crisis which has weighed on the world for the past seven years nor solely to the lack of employment and to the rising cost of life, of materials and of labor; the main cause is inherent to local conditions which obtain in large modern cities in America, still in the constructive period of evolution and transformation and where the utter lack of well planned policy in regard to city development has created unbalanced systems of transportation where we see over congested lines pay for the maintenance of wholly unproductive ones. These conditions are due to the uneven development of the different sections of these cities, creating in some of them some sort of local hypertrophies generally following the energetic, if not always wise, methods employed by some real estate companies too anxious to dispose of their subdivided wilderness. To this may be added the hasty construction of factories and shops in poorly chosen localities and which permanently close their doors after a short while or move to better quarters. To these difficulties, found in the way of satisfactory transportation, must be added the rapid construction of large office buildings within a comparatively small area.

In Montreal, for instance, were built, almost simultaneously, the Transportation Building, the Dominion Express building, the Royal Trust Building, the Duluth Building, the Sauvegarde, the Versailles Building, the Shaughnessy Building and the Bank of Toronto Building; and now we see the office business section of the city expand and its centre of gravity move away from the intersection of St. James and St. Francois Xavier Streets; large office buildings are now being erected on Beaver Hall Hill and on Phillips Square; St. Catherine Street is changing from day to day; large banks are now opening there monumental branch offices; new stores are opened or the old ones enlarged; at the main transfer points are the Dandurand Building, and Almy, and the Drummond Building; to-morrow it will be the Mount Royal Hotel, not to mention the almost continuous line of theatres which at certain hours concentrate, along a distance of barely a mile, crowds that must be handled in a comparatively short time.

Crowded Street Cars

The rapid transportation of the many employees working in these stores and offices and who, from 8 to 9 a.m. and from 5 to 6 p.m. go in both directions like a flood and ebb tide, is a difficult problem to solve and one that taxes the operation of the transportation system to the utmost, owing to its very disproportion with the normal, or base day, service. In Montreal, for instance, at the peak load, during the 6 o'clock rush period, there are on the whole system two and a half times more cars in service than from 10 a.m. to 4 p.m. During this peak load service, the main streets, such as St. James, St. Catherine, Bleury and St. Denis are so crowded that it is practically impossible, particularly near the intersections, to add any more cars. On St. James, between Place d'Armes and McGill Street, there is a continuous line of cars, and on St. Denis, for instance, the average headway between cars is 40 seconds and 32% of cars, passing under that headway, have trailers in tow.

The first and immediate remedy to these conditions, with a view to relieving the congestion and in order to accelerate the car movements, would be to cut down the number of stops or, at least, to stagger them on each side of the streets. This, however, requires, first of all, the good will and the co-operation of the public.

What will be the solution a few years hence? Perhaps the construction of subways under these main arteries making possible an underground express service run in conjunction with, and relieving the local surface service or, possibly, the construction of new surface lines on streets parallel to those on which tramways are now being operated and which could give a mixed service with stops staggered with the present ones.

Subways Would Relieve Conditions

It seems, however, that the better plan would be to follow boldly the American solution and build underground railways which, in so far as Montreal is concerned, should preferably be operated jointly with the existing street railway and under the same management. According to American experience, it seems that the Metropolitan District proper is included within a 30-minute zone; outside this zone, the service becomes suburban and, as such, may be subject to the regulations obtained in the operation of suburban service on main line steam railways, chiefly in regard to time table and headway. However, the contract entered into by the City of Montreal and the Montreal Tramways Co., and under the terms of which the present system is operated, has not accepted this delimitation between urban and suburban travel; the contract, sanctioned by an Act of the legislature, has included in the metropolitan district certain sections of the island separated by great distances so that, for instance, it is possible, to go from Cartierville to the limits of Montreal East, nearly twenty miles, for one single fare, on a trip lasting almost two hours. This feature will perhaps foster the development of vast territories, still unoccupied, in the Metropolitan District, but the means of transportation will have to be organized on a new basis, because it will become impossible to feed from a central point, already too congested, far distant territories which will themselves be, at that time, active and thickly populated centres.

In view of the changes taking place almost continuously, it is necessary to closely follow the increase of population with a view of placing adequate means of transportation at its disposal.

The census of the population bordering along the main arteries must be taken and details given for each office building, department store, factory or theatre. In the questionnaires sent to the managers of large stores or manufactures, information is asked regarding the routes followed by the employees in going to or from their work; such data help in planning what service is to be given to the travelling public at certain hours of the day. The returns so obtained can be shown on the plan of the city by plotting, isometrically or in any other conventional manner, the density of population for each street and even for each block.

With due allowance for the annual percentage of increase in population and the possibility of seeing St. James Street and Notre Dame Street lined with ten-storey office-buildings between McGill Street and the Champ-de-Mars, one may imagine what service would be required to handle the crowds of employees leaving this busy bee-hive between 5 and 6 o'clock; and this increase, with attending congestion, will not only be local but will spread to, and effect, the other large arteries of the metropolis.

Divide Cities Into Districts or Zones

In some American cities, with a view to obviate this overcrowding, it has been recommended that stores and offices, on different blocks, should close at different times; this solution, however, is not practical. Even before the congestion has reached the point of saturation, it seems that the only possible solution will be the construction of subways or of new surface lines looping the principal centers of congestion; at that time, the routing of the main lines should be so changed as to rapidly handle the crowds from the most heavily loaded district towards the limits of districts in which the density of population is constantly decreasing. This is equivalent to zoning; the division of Montreal in zones, with the present rolling stock, could be done only in so far as the rapidity of transportation is concerned, a greater number of cars reaching the limits of the first zone being able, by means of loops, to come back to the starting point. The division in zones, in so far as it might affect the fares, by making the tariff proportional to the haul, would necessitate an entirely new equipment or the remodelling of the present rolling stock. This zoning, however, is impossible according to the contract which specifically determines the limits of a uniform tariff territory.

As to new lines, called extensions in the contract, they should be considered, in regard to population, as are the central districts of the city. A careful census giving the number and the class of houses, tenements and residences, with the number of people residing in the district under consideration, should be prepared, affected by a co-efficient corresponding to the probable growth of the district. The construction of the new line or extension should begin when the development of the district had reached a well determined point.

Co-operation in Planning Street Car Routes

In this respect, there should be the greatest possible co-operation between the city and the Transit Company; this co-operation would then prevent the city from compelling the operating company to immediately build lines which will likely be unproductive and remain a burden on the rest of the system for many years; this co-operation would be such as to avoid, what is done repeatedly: ordering the construction of new extensions in the wilderness, along non-existent streets which appear only on city maps and through land which has not yet been expropriated. This method has, furthermore, the fault of carrying with it unnecessary expenses since the tracks have to be reconstructed when the streets are at last opened and the sewers, gas and other municipal improvements installed. It has also the fault of laying a new line on a right-of-way which cannot be reached as long as the cross streets have not been opened up. On a new line, recently built under such conditions, passengers wishing to get on or from the cars can only do so by jumping over fences and trespassing on private property. It seems that a well thought out plan should foresee the simultaneous construction of the streets, of the subterranean municipal improvements and of the street car tracks.

In regard to the Island of Montreal, the construction of new lines serving municipalities outside of the territory already specified in the contract seems difficult to undertake. According to the present contract entered into by the city and by the Montreal Tramways Company, every municipality served by the Company should be able to support its own share of the cost of operation of the transportation lines necessary to handle its quota of traffic, without being a load on the city of Montreal or on the other munici-

palities served by the same system. This clause of the contract is perfectly fair and reasonable. It prevents, as a consequence, the construction of new extensions into the several municipalities surrounding the Metropolis, on the island of Montreal, because such lines could only be operated if the interested municipalities were able or willing to guarantee the fixed charges and operating expenses which could be met only by prohibitive fares. It seems that in such cases the construction of the proposed extension must be postponed until the time when the population will be large enough to ensure an adequate and sufficient revenue.

In concluding, it is well to insist upon the necessity of co-ordination between the several municipal departments and the transportation system; more particularly in regard to street tramways this co-ordination must have in view the simultaneous changes of grades, renewal of pavement and renewal of tracks in the central sections of the city; in the outlying districts and the suburbs, and after a careful study of the possible normal development of any district, it will be wise to build the new extensions or transportation lines only after all the preliminary planning will have been settled, after all the expropriations will have been concluded and after all municipal improvements, streets, sewers, water and gas mains and electric conduits have been constructed and installed.

With a view to improve its service and to help in giving to the city in which its lines are laid, the poise, the symmetry, the quiet orderliness, the regularity and harmony that go toward making the distinction of well governed cities, the transportation Company should endeavor to do away with anomalies and conditions which may not be abreast of the times; it should replace all unsightly wooden poles by steel or reinforced concrete poles which, with the advantage of durability, easily lend themselves to some sort of decoration; it should try to unify the types of rails, of track construction and of the cars; it should provide shelters and loading platforms for the passengers at the main transfer points and generally should endeavor, with the hearty co-operation of its personnel, to foster among the public the riding habit which alone can ensure the success of any transportation enterprise.

This result ought to be easily obtained in Montreal where the present contract has made partners of the city, that is the public, on the one hand, and of the Transportation Company, on the other. Paper read before the Town Planning Convention, Montreal, Sept. 29, 1921.

CORRECTIONS IN REPORT OF MEETING OF ENGINEERING SECTION, A.A.A.S.

Certain typographical errors, incident to the change of form and date of publication unfortunately crept into the report of the meeting of the Engineering Section of the American Association for the Advancement of Science appearing in our issue of Jan. 3. The title of Dr. Heymans' address should have read "Optical Determination of Stress Distribution in Engineering Problems"; the temperature above which the metal parts of hydraulic installations should be kept a fraction of a degree was stated by Mr. Murphy as 32 deg. F.; "electrically" in the sixth line of the second paragraph of the report of Sir Adam Beck's address should read "electricity"; in Prof. Brown's comments on the address by Mr. Harris, the second sentence should read "Engineering courses in Canada should be primarily technologic"; and in President Howe's comments on the same address, near the bottom of the first column of page 110, the first sentence should read, "President Howe expressed a fear lest the present trend toward the adoption of courses in business administration might be overdone."

Archibald & Holmes, general contractors, Toronto, have moved their head office from the Continental Life Building to 709 Yonge St., Toronto.

C. E. Hogarth will present a paper before the Montreal Branch of the Engineering Institute of Canada on "Principles of Water Softening," on January 26, 1922.

AMERICAN CONCRETE INSTITUTE CONVENTION

THE following tentative program has been arranged for the annual convention of the American Concrete Institute which will be held at the Hotel Winton, Cleveland, February 13-16 inclusive.

MONDAY, FEB. 13

Registration (11 a.m.)

Meeting of Committee on Committees. (Chairman of all Committees to discuss future work of the Institute.)

Concrete Roads (2 p.m.)

Report of Committee S 6 on Concrete Roads. Presentation and discussion of revised standards, Clifford Older, Chairman. Discussion of Plant and Material Handling Problems. Moving Pictures.

Concrete Houses (8 p.m.)

Report of Committee S 5 on Reinforced Concrete Houses (New Building Regulations), E. G. Perrot, Chairman.

Papers and addresses by two or three builders of Concrete Houses—no theory—no guesswork—no untried conjectures—actual experience on how it is being done. One of these addresses will be by Miss Kate Gleason, Rochester, N.Y., whose concrete houses are close to the hundred mark—all sold—at a profit.

TUESDAY, FEB. 14

Research (9 a.m.)

Report of Committee E 3—Research. W. K. Hatt, Chairman. A survey of important research which is being undertaken by various agencies and of research for which there is need.

Presentation of the Wason Medal. Sanford E. Thompson, Chairman Committee G. 5. Response.

Announcement of the work of Committee G 3 on Form of Standards, by the present.

Business Session. Report of Board of Direction, by the secretary. Appointment of Tellers to canvass ballots for Officers.

Concrete Products Manufacture (2 p.m.)

Report of Committee P 1 on Standard Concrete Building Units (New Standards for Block, Brick and Structural Tile. R. F. Havlik, chairman.

Report of Committee P 5 on Fire Resistance of Concrete Building Units. Lesley H. Allen, chairman.

Report of Committee P 4 on Concrete Staves (special reference to strength and testing.) Walter Brassert, chairman.

8 p.m.—Report of Committee J 2 on Concrete Pipe. B. S. Pease, chairman. Institute Representation.

Report of Committee P 7 on Concrete Pipe, Drain Tile, and Conduit. C. F. Buente, chairman.

Report of Committee P 6 on Products Plant Operation. S. H. Wightman, chairman, leading a general discussion of Plant layout, equipment and operation problems.

WEDNESDAY, FEB. 15

Engineering Design and Inspection (9 a.m.)

Report of Joint Committee on Concrete and Reinforced Concrete—presented by reference to preprints previously distributed. S. C. Hollister, chairman Institute representation. The report will be discussed by major subjects, led by Chairman of Local Committees of Contractors from New York, Boston, Philadelphia, Chicago, and elsewhere, and by Chairmen of Institute Standing Committees whose work involves a special consideration of subjects covered in various section of the Joint Committee Report. The discussion will be centered chiefly upon the subjects in the following outline:

1. Quality of Concrete—Proportioning, Mixing, and Placing (Chapters III, V, and VI). Chairmen Local Contractor Committees and N. M. Loney, chairman, Committee C 6.

2. Details of Construction—Fireproofing and Con-

struction Joints (Chapter VIII). C. R. Gow, chairman, Committee E 4.

3. Waterproofing—Protective Treatments. (Special reference to Corrosion of Steel Reinforcement) (Chapter IX.)

Business Session (11:45 a.m.)

Remarks by Retiring President. Announcement by tellers of new officers. Induction of new officers.

2 p.m.—(Continuing discussion of Joint Committee Report.)

4. Surface Finish (Chapter X.) J. C. Pearson, chairman, Committee C 3; N. M. Loney, chairman, Committee C 2.

5. Design (Chapter XI) with particular reference to Proposed Design Requirements on Cost of Construction. A. R. Lord, chairman, Committee E 1 and Chairmen Local Contractor Committees.

8:30 p.m.—An informal, social, get-together, with cider and doughnuts. Here's your chance to button-hole somebody and "tell him" or "ask him."

THURSDAY, FEB. 16

Practical Field Problems (9 a.m.)

A study of Proportioning Materials and Consistency, Slump Tests, Test Cylinders.

A demonstration of sieve analyses of aggregates, water control, slump tests and casting test cylinders as a means of relating laboratory knowledge to Field Methods.

Report of Committee C 1—Contractors Plant. R. C. Wilson, chairman.

Report of Committee C 2, Concrete Floor Finish—Presenting Simplified Standard Specifications, followed by two brief papers on Special Floor Finishing Methods.

2 p.m.—Report of Committee C 3 on Concrete Surfaces. J. C. Pearson, chairman.

Changes in Stucco Practice. Exterior of Industrial Buildings. Special Decorative Effects. Interiors of Buildings. Bond of Applied Coatings.

Report of Committee C 4 on Metal Forms. Edward A. Steele, chairman.

Paper on Repair of Concrete Ships.

Paper: Graphic Determination of Stresses. Prof. George E. Beggs.

B.C. ENGINEERS WORK ON AFRICAN PROJECT

THE first party of engineers which went from British Columbia to take charge of harbor and railway construction work on behalf of the Imperial Government on the Gold Coast, West Coast of Africa, has arrived at the scene of operations. The contract for the work was secured by the contracting firm of General J. W. Stewart, C.B., K.C., M.G., of Vancouver, the well-known railway builder. The cost of the work will ultimately total over eleven million dollars.

Major C. R. Chrystdale, A. G. Graham, Angus Stewart and Major John Retallack, all well known in Vancouver and Victoria, comprise the party. Major Retallack is not connected with the Stewart enterprise, but has gone out to take up an appointment under the Colonial office. Another large party of engineers will leave London shortly, among them being two or three British Columbia men and many other Canadians.

The preliminary work on the big contract is understood to be proceeding well and actual construction will be under way shortly. Before the harbor works could be commenced it was necessary to lay out a townsite and set up a modern village for the white workers. Construction of the railway cannot proceed very rapidly until the harbor work is well in hand.

J. W. Shackleton, civil engineer of Chatham, Ont., is constructing a new map of the city, together with all the latest additions, and will incorporate in it details of the survey of the city when it was first marked by the government over 100 years ago.

THE IMPORTANCE OF IRRIGATION WORK

Benefits Achieved in Alberta Are Encouragement to Further Expenditures

A. S. Dawson, M.E.I.C.

Chief Engineer, Department Natural Resources, Canadian Pacific Railway Company, Calgary

ACCORDING to an article in "The Monetary Times Annual" for 1922, by Mr. A. S. Dawson, up to the end of 1920 there had been expended on the construction or irrigation works in Southern Alberta about \$20,000,000, to serve about 850,000 acres of irrigable land.

This phase of development was practically all handled by large companies — pre-eminently the Canadian Pacific Railway Co., who held large blocks of vacant land, constructed the works to serve them with water, and then sold to new settlers, with a perpetual contract for a supply of water to the lands at a fixed annual charge. This form of enterprise has developed all the large projects constructed up to date. The conditions gradually changed, because the large areas that still awaited development were practically all settled, and plans were formulated to develop these areas by co-operative effort on the part of the land owners themselves.

Federal Government's Work

In Canada, the Federal Government controls all the water, conducts the hydrometric work, and makes all preliminary surveys and investigations in connection with irrigation development. No works can be undertaken without government sanction, based on thorough engineering investigations which have proven the feasibility and economic soundness of all schemes of any magnitude.

These surveys to date show that close to a million additional acres in Southern Alberta can be served with water within reasonable cost limits; and some of this area will probably be served as a result of the recent settlement of certain long outstanding matters between Canada and the United States, and within the scope of the International Waterways Commission. Preliminary surveys also indicate that additional areas of about 3 million acres in Alberta, and $4\frac{1}{2}$ million acres in the Province of Saskatchewan could also be profitably irrigated.

Value Demonstrated

During the past dry cycle of five years, all doubts as to the benefits of farming large portions of Southern Alberta under irrigation methods have entirely disappeared, and now everyone is an enthusiast of the idea of bringing every possible acre under the ditch system.

But how were the construction charges to be met? The settlers were not financially able to, as a result of several short crops; and there was no incentive for corporate interests to provide the necessary capital. The Provincial Legislature therefore decided — or rather were forced — to provide the necessary machinery, whereby these systems can be built by means of the enactment of what is known as the "Irrigation District Act." This act provides for the formation of irrigation districts, with power to raise the necessary funds to construct the works by bond issues, the security for which is the land within the district.

Among the outstanding features of this act are the appointment by the Lieutenant-Governor of an "Irrigation Council," who may forbid any act or course of conduct proposed to be done, or entered upon by the board of directors; and without whose authority no expenditure can be made on any debenture issue, nor any contracts for construction awarded. All debentures issued under the act must provide for the payment of the whole principal money within 30 years of the date of the issue thereof, and shall be repayable by annual instalments extended over the whole of such period, or not less than the last 20 years thereof. The sale of debentures and rates of interest are subject to the approval of the government. Moreover, the province has undertaken to make a full guarantee of these bond issues, together with the interest. As previously stated, the Dominion Reclamation Service makes all preliminary surveys and in-

vestigations as to the feasibility of a project. When these are completed, and the boundaries of an irrigation area are fixed, the act provides that a petition signed by the owners of at least 51 per cent. of the area involved shall be submitted to the Minister of Public Works of the province, asking for the creation of the district. After approval of such, a board of three trustees is elected to conduct its affairs.

Financing Irrigation

The first district to be financed under this procedure is what is known as the "Lethbridge Northern," containing an irrigation area of about 105,000 acres, which is now well under construction, at an estimated cost of \$51.00 per acre. The total bond issue authorized for this project was \$5,400,000, and of this, \$4,400,000 worth of 30 year bonds were disposed of at a very favorable rate. Provision was made for making the bond issue large enough to carry interest, and operation and maintenance charges until the end of the year, after the completion of the works — so that the farmers will get the benefit of the water before they have anything to pay. In the case of the Lethbridge Northern project, no payments toward a sinking fund are required to be made until after the seventh year.

Construction has also been commenced on another district known as the "United," containing 23,000 acres irrigable, at an estimated cost of \$645,000, or \$28.00 per acre. Several other districts are in the course of formation; and the government of the province has announced as a definite policy that it will guarantee the bond issue for any project which has been shown to be feasible, and economically sound by means of thorough surveys and investigations on the part of the Dominion and provincial engineers.

This policy will no doubt have a very marked effect on irrigation development in Southern Alberta. There are, however, many problems which will result therefrom, such as the reductions in size of the holdings, and the colonization of the additional farm units created.

Survey Board Created

Another matter which may be of interest to many is, that this government (and a Farmers Government at that) has recently created what is known as the Southern Alberta Survey Board, consisting of 4 outstanding men, and including as chairman, the chairman of the Canadian Section of the International Waterways Commission. This board held their opening session on November 29th last, and are now sitting, and their obligations are to "Enquire into, report on, and make recommendations, in regard to the undertaken matters affecting the welfare of those areas in the southern part of the province which are subject from time to time to drought.

"(A)—A policy in regard to the development of farm lands, which surveys of the Dominion Reclamation Service show the possibility of irrigating.

"(B)—Methods that may be adopted in furtherance of the colonization of irrigable lands.

"(C)—A policy in regard to the furtherance of the greater economic advantage of farmers on land which cannot be irrigated.

"(D)—The expediting of the investigations by soil and topographical surveys already initiated.

"(E)—The general financial conditions prevailing in the areas referred to, having regard to the prime necessity for the maintenance of credit of individuals, institutions and municipal and school districts."

It is needless to point out the problems to be dealt with by the board are very great, and upon their solution the future welfare of a very large portion of the people of the province depends.

Educational Work

In addition to two experimental and demonstration farms maintained by the Federal Government in Alberta, the Provincial University is doing splendid work, and now has a three-year course in agriculture leading up to the degree of P.S.A., in addition to a combined six-year course in arts and agriculture.

The Provincial Government Department of Agriculture also operates 5 agricultural schools, and 5 demonstration farms, on two of which instruction is given on all matters pertaining to irrigation.

What is needed is co-operation and team play between the men on the land and those who are endeavoring to work out the broader questions affecting irrigation development on a large scale; and in such work, organizations such as the Western Canada Irrigation Association, and the recently created Survey Board of Southern Alberta, have a large part to play, and should prove a powerful factor in the general welfare of the province.

Agriculture and live stock business are the basic industries of this portion of the country, and must go hand in hand. Irrigation stabilizes both, and therefore stabilizes business conditions in general.

AMERICAN GOOD ROADS CONVENTION

IN order to bring about closer co-operation and a more thorough exchange of views and experiences in building highways, especially along the border between the two countries, Canadian road and street officials, engineers and contractors to the number of several thousand, are being invited to participate as delegates in the 12th American Good Roads Congress and 13th National Good Roads Show, to be held in the Coliseum, Chicago, January 17 to 20. The big convention, which this year will assume more of an international character, will be held under the auspices of the American Road Builders' Association.

Among the new officers recently elected by this organization is W. A. McLean, deputy minister of highways, province of Ontario, who was chosen a director. Prominent in the work of the organization also are: J. A. Duschatel, city manager of Outremont; Lucius E. Allen, Belleville, Ont.; Malcolm Calder, Calgary, Alta.; H. J. Walker, Cornwall, Ont.; F. M. Clark, Halifax, N.S.; H. A. Brazier, London, Ont.; C. C. Lapierre, Paul Emile Mercer, John Randall Roberts and H. C. Van Scoyoc, Montreal, Que.; C. R. Wheelock, Orangeville, Ont.; John C. Dufresne, Penticton, B.C.; Henry Gabriel, chief engineer, department of highways, province of Ontario; B. Michaud, deputy minister, department of roads, Quebec; F. C. Biggs, minister of public work, province of Ontario; R. C. Harris, commissioner of works, Toronto; K. D. McDonald and George William Rayner, all of Toronto; S. L. Squire, president Canadian Good Roads Association; Walter Scott, Victoria, B.C., and many other Canadians active in highway work.

That Canada will be well represented at the congress is evidenced by the fact that governors of Canadian provinces, mayors of Canadian cities, and Canadian good roads, engineering and contracting organizations are expected to send from three to five official delegates each to participate in the discussions and report as to the latest developments in road and street construction demonstrated and explained, during the meeting.

Canada's Programme

The great programme of highway construction upon which Canada is embarking will be fully discussed along with prospects for 1922, highway finance, administration, maintenance and transportation, highway accidents and their cause, fall contract letting, bridge construction, drainage, salvaging old roads, highway specifications, material prices and labor, traffic regulation, training engineers and supervisors and other subjects too numerous to mention. The congress and show will surpass anything of the kind ever held, either in Europe or America, both in point of attendance and instructive value and in the number and variety of the exhibits of road-building machinery, materials, methods and appliances and highway transportation equipment. Fully 20,000 delegates are expected to attend, not only from the United States and Canada, but from Cuba, Porto Rico, Hawaii, Alaska, Mexico and several South American countries. All of the 40,000 square feet of exhibiting space in the Coliseum and annex was taken at the first drawing of space in October, making it necessary

for the exposition officials to lease adjoining buildings in order to house the overflow. The United States Bureau of Public Roads will have an enormous exhibit, covering 2,000 square feet, and demonstrating impact, material and sub-grade tests and the methods of construction approved by the government.

Will Discuss Materials

One session of the congress will be devoted to Portland cement concrete roads, another to the asphalt and bituminous types, a third to brick and other types of pavement, and fourth to earth, gravel and macadam roads. Another session is to be given over to a thorough discussion of the problems involved in highway transport. The Portland Cement Association, The Asphalt Association, The National Association of Paving Brick Manufacturers, and other organizations are co-operating with the American Road Builders' Association in organizing the congress.

LARGE FEDERAL LOAN FOR HIGHWAYS

WITH the exception of Alberta, all the provinces of the Dominion have taken advantage of the Federal aid to highways plan, and highways department officials feel that the appropriation of \$20,000,000, which the Federal Government set aside in 1919 to be apportioned on a forty per cent. basis, will be used up before the end of the five-year period covered by the appropriation.

The estimated cost of highway improvement projects undertaken to January 1, 1922, under agreement with the Federal Department, was \$29,247,667, with a total mileage of approximately 4,370 miles. The Dominion Government's share of the projects under agreement is \$11,699,066, and the act has yet almost three years to run.

It is expected that before the expiration of the appropriation there will be requests from the various organizations interested in highway building and improvement for increases in the Federal grant for the purpose.

Saskatchewan leads the provinces in respect to the mileage of projects under agreement, with 1,230 miles, at an estimated cost of \$1,375,093, and an average cost per mile of \$1,124.

Ontario is well in the lead in cost of roads built, however. The figures for this province are: Projects, 23; mileage, approximately, 603; estimated cost, \$13,863,155; average cost per mile, \$22,980.

Figures for the other provinces are:

Alberta, none.

British Columbia, mileage, 337; estimated cost, \$2,612,693; average cost, per mile, \$7,731.

Manitoba, mileage, 764; estimated cost, \$3,478,902; average cost, per mile, \$4,546.

New Brunswick, mileage, 1,200; estimated cost, \$3,058,708; average cost, per mile, \$2,571.

Nova Scotia, mileage, 168; estimated cost, \$1,790,325; average cost, per mile, \$10,605.

Prince Edward Island, mileage, 181; estimated cost, \$329,565; average cost, per mile, \$1,818.

Quebec, mileage, 243; estimated cost, \$2,712,226; average cost, per mile, \$11,116.

The total number of projects under agreement is 170, with an average, per province, of 21, and the average cost, per mile, of all the roads constructed under agreement is \$6,182. Highway plans must be approved by Federal officials before payment of the 40 per cent. cost is allowed.

The Wellman-Seaver-Morgan Co., of Cleveland, Ohio, has been awarded a contract for thirty-four cargo handling cranes for the Department of Docks for the city of New York. This order constitutes the largest installation of dock cranes ever placed on this side of the Atlantic. The cranes will all be of the semi-portal gantry type, with travelling, revolving, hoisting and boom-lifting motions. Twenty-six of them will have a capacity of from 2½ tons to 5 tons while eight will have a capacity of from 1½ ton to 2½ tons.

ENGINEERING INSTITUTE TO HOLD GENERAL MEETING

THE Annual General Meeting of the Engineering Institute of Canada with which will be associated a Professional Meeting, under the auspices of the Montreal Branch, will be held at Montreal, January 24-25. A number of important committee meetings will take place about this time. The following program has been arranged.

Tuesday, Jan. 24

- 9:00 a.m. — Registration, E.I.C. Headquarters, 176 Mansfield St.
- 10:00 a.m. — Annual Meeting Called to Order.
- 1:00 p.m. — Informal Luncheon. (Tickets, \$1.00.) C.P.R. Windsor Street, Mezzanine Dining Room.
- 2:30 p.m. — Resumption of Business Meeting and President's Address.
- 7:30 p.m. — Banquet, followed by Smoking Concert. (Tickets, \$5.00.) Rose Room, Windsor Hotel.

Wednesday, Jan. 25

- 10:00 a.m. — Visit to Dominion Engineering Works, Rockfield. (Large 41,000 h.p. turbine unit for Shawinigan may be seen under construction.)
- 1:00 p.m. — Luncheon — Rose Room, Windsor Hotel. Members and Ladies. (Tickets, \$1.50 — Visiting Members, Complimentary.) Followed by short address.
- 3:30 p.m. — Professional Paper at Headquarters.
- 8:15 p.m. — Professional Paper at Headquarters.

The Montreal Branch extends a cordial invitation to all members of the Institute and desires it to be known that accommodation for visiting members will be reserved at the Windsor Hotel. Further information may be obtained from J. L. Busfield, secretary-treasurer, Montreal Branch E.I.C., 260 St. James Street, Montreal.

HYDRO CONGRATULATED BY DISTINGUISHED ENGINEER

AFTER witnessing the formal opening of the Queenston-Chippawa power development on December 28, Francis Lee Stuart, consulting engineer, New York, wrote to Sir Adam Beck a warm letter of appreciation of what the Hydro-Electric Power Commission of Ontario had accomplished. Mr. Stuart, who formerly was chief engineer of the Erie and the Baltimore and Ohio Railroads, is now, incidentally, vice-chairman of the Technical Advisory Board of the Port of New York Authorities, and consulting engineer of the Hudson River Bridge Corporation, in charge of all foundation work and terminal facilities, a project involving an estimated expenditure of \$550,000,000. The letter reads as follows:

"You are today formally opening an undertaking which is of epoch-making importance and far-reaching in potentialities for the material progress of Canada, as well as of the Niagara district of Ontario.

The vision, will and ability of the Commission and the people of the Niagara district to develop their natural resources to such an efficient degree will be appreciated more and more as the years go by.

The conception is simple — the water is taken by an open canal from a point at the head of the rapids above the Niagara Falls and delivered to a powerhouse at the foot of the rapids below the Whirlpool — thereby getting all of the energy possible from each cubic foot of water used in its passage from Lake Erie to Lake Ontario.

The magnitude and importance of the work in carrying out such a conception is one of the accomplished feats of our generation. It is the largest single Hydro-Electric development in the world and is the largest publicly owned undertaking of its kind ever attempted. It is a path-finder in such a field.

Its importance is not yet fully understood. By the magnitude of the cheap power produced and by the example of its usefulness it will directly and indirectly give an im-

pulse to the upbuilding of the entire country, which will be second in importance only to the effects which the railroads have had on the country's growth. The difficulties of construction were many and at times seemingly insurmountable. Each foot of canal represented effort, each mile great difficulties overcome, and each section of the work an established precedent in construction.

The personnel who carried out the work were faithful, hard-working, able engineers and superintendents of construction, meeting their problems daily with a resourcefulness, courage, and earnest effort which deserves your admiration. Gaby, Acres, Angell, Goodwin, Brandon, Hogg, Hull, Hearn, Millar, Blanchard, Scriven, LeRoy, Anderson, Reid, Nablo and many others should be remembered as men who carry on, and carry on well.

It should be a matter of congratulation and of gratitude to the directing force of and of those on the work that this great project has been carried through in such a workman-like way with honest and able men, without discord, disaster, or scandal and now, without fuss or feathers, stands out as an accomplished fact, a splendidly effective addition to your resources of which all Canada can be proud."

PORTLAND CEMENT ASSOCIATION

AN important step towards ensuring high and uniform quality cement was taken recently by the Portland Cement Association at the final session of the annual meeting held in New York recently, when the Association's constitution and by-laws were amended so as to make membership in the Association "contingent upon member's product meeting the standard specifications for Portland cement adopted by the United States Government and the American Society for Testing Materials."

Engineers, architects and contractors are familiar with the high standard of specifications governing cement manufacture and will herald this action as the greatest advance step ever taken by the industry. The Portland Cement Association is distinguished for its co-operative work with technical societies. This has been in the nature of contributing to the improvement of building materials, methods and standards in general, among these being building codes, but the Association has particularly been active in keeping standard requirements for Portland cement on a high plane and in insuring its proper use by the consuming public.

HYDRO RADIAL BY-LAWS PASSED

AN interesting feature of the recent municipal elections in Ontario was the passing of the Hydro Radial by-laws. A by-law was passed favoring the purchase of the Niagara, St. Catharines and Toronto Railway. In this case practically all the municipalities gave large majorities in favor of the purchase while the Toronto Suburban and the Toronto Eastern Railway by-laws were also passed by substantial majorities.

What is admitted by experts to be an ideal interurban traction project has been endorsed by the electorate on behalf of public ownership. Five lines radiating from Toronto connecting with Guelph and the Niagara frontier will give a balanced load factor which is a condition precedent to the successful exploitation of any interurban rapid transit system. When the vote is implemented by legislation Sir Adam Beck will be able to deal at once with the Toronto terminal situation, the power and radial "clean-up" can be consummated, the various lines co-ordinated into one system and, with betterments brought up to a proper standard or roadbed and equipment.

In the United States there are 7,338 firms manufacturing trucks, tractors, automobiles and other vehicles dependent upon good roads and having a total invested amounting to \$6,000,000, an amount exceeding one-third the capital of the country's railroads and an annual output of 1,500,000 passenger cars valued at \$1,410,000,000; 300,000 commercial cars valued at \$400,000,000 and 165,000 tractors valued at \$225,000,000.

TRAFFIC INCREASE AND GROWTH OF POPULATION

IN any estimates of future traffic made for the purpose of planning transportation facilities or public utilities associated with transportation, the first ideas of the engineer are likely to gather about the rate of growth of population. It is perhaps natural to assume that if the population of a community doubles, the traffic by rail or by highway would at the same time be doubled. That the true law of increase of traffic differs widely from this may be shown conclusively by the consideration of some typical cases.

Consider, for example, the growth of steam and electric railway traffic in Canada and in the United States in recent years. Whereas in Canada the passenger traffic on steam railways increased from 1901 to 1919 by 138%, the freight traffic increased during the same period by 216%, and the passenger traffic on electric railways increased 520%, the population increased only 65%. In the United States the increase in passenger-miles for the same period was 189% and in freight ton-miles it was 158%, while the population increased only 38%.

If traffic within a large city or between two cities be considered, a similar law is seen to hold. From 1912 to 1919 the increase in vehicular traffic across the East River bridges at New York increased 153%, whereas the population of Greater New York increased but 12%. Between Philadelphia and Camden, N.J., the passenger ferry traffic across the Delaware River between 1900 and 1920 increased 176%, the vehicles carried by the ferries increased in number by 153%, while the population increased only 41%. Between the years 1912 and 1920, the trans-bay passenger traffic between San Francisco and the cities opposite, including Oakland, Berkeley and Alameda increased 35% in spite of the discouragement offered through the 8-mile ferry and electric railway trip between San Francisco and Oak-

land. During these eight years the population of San Francisco increased but 17%.

It thus appears that traffic either by rail, by highway or by ferry within a large community, or between communities, increases far more rapidly than the population. The basis of such a law is not difficult to find. Within recent years, the means of transportation have enormously multiplied and improved. Although very considerable extension of steam and electric railways has occurred in America during the past twenty years, a most astounding increase in motor transport facilities has occurred during the same period. In the United States the production of motor vehicles increased from 1910 to 1920 by 1080%, while at the same time the population increased but 15%. In Canada the motor vehicle registrations increased from 1910 to 1920 by 4400%, corresponding with an increase in population of 27%. Registration of motor vehicles in Ontario for the same decade increased 3600%, while at the same time the population increased 16%.

With the extension of the facilities offered for travel, particularly by the enormously increasing production of motor vehicles, it is natural that highway traffic should have increased on the better class of roads at an enormous rate. An interesting statement made recently by a prominent engineer of the State of Michigan indicates that with the improvement of the highway between Ypsilanti and Ann Arbor, the vehicular traffic increased from 240 vehicles per day six or seven years ago to 3,100 vehicles a day during the last year. It is probable that this is merely typical of the experience of other improved highways. Figures of like order might be quoted to show the amazing increase in traffic on the Toronto-Hamilton highway following its improvement during the war period.

Estimates of traffic over a given route can, therefore, be made safely only after considering along with the probable increase in population, the probable effect of the added facilities for transportation. Their is such a thing as a habit or fashion in movement of traffic, as there is in less serious matters. Once the public gets accustomed to an improved highway, for example, and finds the service or facility offered to be an attractive one, traffic is bound to increase at an astounding rate, as has been the experience in recent years where new and popular facilities for transit have been provided.

THE ENGINEER AS A MANAGER

FRANK discussion of the shortcomings of the engineer as an executive or administrator was brought out following the address of R. C. Harris, Commissioner of Works, Toronto, at the Toronto meeting of the American Association for the Advancement of Science. The engineer should make the highest type of administrator, said Mr. Harris, but by reason of native modesty or unsuitable training, he frequently fails to appreciate the economic features of the situation, and discloses inability to relate the creation of physical works to the value of the dollar. He has not generally had sufficient human contacts to make him a good executive, and, continued Mr. Harris, regards himself rather more as a builder or constructor than as a manager of men.

The qualifications of the engineer as a manager have been vigorously debated in the engineering press during the last few months, growing out of an address by Philip Cabot, member of a prominent New York financial house, at a joint meeting of the Founder Societies in New York last October. Mr. Cabot's strictures were severe. He characterized the engineer as scientific, studious, severe, ascetic, cool, cautious and unimaginative. "He is a man," said Mr. Cabot, "who curbs his enthusiasms, who does not allow his conclusions to be colored or influenced in the slightest by an idealistic or impulsive temper." According to Mr. Cabot, these characteristics render the engineer constitutionally unfit to lead or direct large industrial or public enterprises. He pictured the successful industrial leader as one having the capacity to inspire large bodies of men, and as the possessor of the promoter or salesman type of mind rather than that of the student or scientific investigator.

He regarded the engineer as a hand which executes rather than a mind which directs and controls, and believed him to be an unpromising candidate for promotion to managerial positions.

Those who have risen to the defence of the engineer in these discussions have pointed out that while the promotional type of mind is useful, it is an exceedingly dangerous one unless carefully watched and guided. The enthusiast who sees everything in a rosy light is likely to wreck an enterprise much more quickly than the cool and unemotional engineer. It very frequently happens that the latter is called in to straighten out some of the financial and operating muddles that have been brought about by a manager of the promotional type.

The truth of the matter is that the management of industrial or other enterprises that involve dealing with a large force requires several characteristics or qualities of mind. Enthusiasm must be matched by cool and careful judgment. Wherever a man can be found who combines in himself the capacity to direct and inspire large bodies of men with sound technical and financial knowledge, his price is above rubies. Men of this type who have undertaken managerial work are not unknown. On this continent, two notable examples in recent years are General Goethals and Herbert Hoover, not to mention several of our fellow-Canadians who are successfully directing large undertakings at the present time. It will be interesting to survey the field in ten or twenty years and discover the effect of the increasing popularity of courses in administrative engineering. Once the idea of the suitability of the administrative field for graduate engineers has been thoroughly assimilated, and engineering students have been taught to appreciate the financial and managerial factors in an enterprise, as well as the technical ones, the number of engineers in managerial positions should increase very rapidly.

Already very considerable numbers of engineers are known to be occupying executive positions on this continent. At least six railroad presidents and five vice-presidents are engineers. Of the 230 city managers in Canada and the United States, about 75% are civil engineers. Municipal councils appreciating the fact that the largest item of the civic budget is associated with the department of works, naturally look to the civil engineer as likely material for a city manager. As long as it is possible to discover men who have not only sound technical knowledge, but courage, executive and business capacity, a knowledge of municipal law and finance, and ability to explain clearly and precisely the civic policy to the citizens, city managerships should prove a likely field for the engineer. With the growing tendency for this form of civic government it is very probable that the engineer will be more and more frequently employed in public administrative posts.

AN ENGINEER'S TRIBUTE TO HYDRO

THERE is danger of political controversy obscuring in some measure the solid engineering achievement involved in bringing the Queenston-Chippawa power development to the production stage. Those who are in a position to appreciate the difficulties—engineering and economic—overcome in this work cannot fail to rank it with some of the greatest enterprises in the history of engineering. In other days, men who did less than the directing heads of the "Hydro" engineering staff were accorded national, and even international, honours. It is refreshing, in the midst of present calumnies, to read elsewhere in this issue the hearty tribute of Francis Lee Stuart, an engineer peculiarly qualified to express an opinion on the worth of the services of other engineers.

OBITUARY

ADAM BEATTIE, construction engineer, who was associated with the Grasseill Chemical Co., of Magog, Quebec, for over 23 years, died recently in the Homeopathic hospital, Montreal. Mr. Beattie was born in Owen Sound, Ont., 67 years ago.

PERSONALS

PROF. J. P. McMURRICH of the Department of Anatomy University of Toronto has been elected President

of the American Association for the Advancement of Science for the coming year and will preside at the next Convention of the Association which meets at Boston, Mass., December 26th, 1922. Prof. McMurrich graduated from the University of Toronto in 1879 and two years later obtained his degree of Master of Arts. Four years later he secured his Ph. D. from the John Hopkins University at Baltimore. The degree of L. L.D. was conferred upon him by

Michigan University in 1912. From 1882 to 1884 he was Professor of Biology at the Ontario Agricultural College. He then went to the United States where he occupied several chairs in anatomy and biography at various colleges, returning to Toronto from Ann Harbor, Michigan.

PROF. F. R. MOULTON, of the University of Toronto, has been elected secretary of the Chemistry section of the American Association for the Advancement of Science.

A. ST. C. RILEY, formerly general sales manager of the Trussed Concrete Steel Co. of Canada, Ltd., has been appointed manager of the Montreal Branch of that company with offices in the Drummond Building, 511 St. Catharines St. W., Montreal.

RECENT PUBLICATIONS

STANDARD SPECIFICATION FOR WIRE ROPE. The Canadian Engineering Standards Association has issued a new bulletin No. 4, 1921, containing the standard general specification of wire rope. The specification which embodies those requirements for standard grades of wire rope for mining, dredging and similar purposes, which are regarded as essential in order to protect the purchaser against an inferior or defective product, and to guide the manufacturer or importer as to standard practice in Canada. It will be observed that the specifications are combined. This was done because it was recognized that the governing conditions for both kinds of work were so far in agreement that separate specifications were unnecessary. Copies of this specification may be obtained from R. J. Durley, secretary of the Canadian Standards Association, Ottawa.

The personnel of the Southern Alberta Railway Board consists of C. A. McGrath, Chairman, Judge A. A. Carpenter of the Public Utilities Commission of Alberta, G. R. Marnoch and W. H. Fairfield of Lethbridge. The purposes of the board are to recommend a definite irrigation policy based on the report of the Dominion reclamation service; soil surveys and classification of non-irrigable areas, with recommendations as to possible farming methods or other uses; the making of individual farm surveys, with a view to inquiring into the financial conditions of farmers in the dry areas. Lethbridge will be the headquarters of the commission.

St. Lawrence Navigation and Power Investigation

Details of Double Development Plan as Proposed by the New York & Ontario Power Co. — Suggestions Based on 14 Years' Study of Conditions in Vicinity of Waddington — Proposed Sites at Rapid du Plat and Long Sault

THE suggestions offered herein are based upon the experience and studies continuously carried on by the New York & Ontario Power Co. during the past fourteen years. During this period an engineering office has been maintained in this division and three different hydro-electric power plants have been operated at various times. Particular attention has been given to the section between the Long Sault Rapids and Ogdensburg on account of the possible extension of the company's development at Waddington, N.Y.

General Description of River

Having regard to the various problems involved, and to the governing physical conditions existing, the following description of the river is given preliminary to a more particular consideration of the method of development.

The discharge of Lake Ontario is now controlled by the

ance being made for the necessary slope between these points.

From Morrisburg (Lock 23) to the head of the Long Sault Rapids (Lock 21), the fall is 12 ft. in a distance of 16 miles, the shores being generally much lower than those above (or west of) Morrisburg.

From the head of the Long Sault Rapids to the foot of Barnhart Island (5 miles), the fall is 41 ft. and the shores are correspondingly lower than those above Lock 21. By constructing a low dam in the vicinity of the foot of the Long Sault Rapids the greater part of the present fall between Morrisburg (Lock 23) and the foot of Barnhart Island (53 ft.) is recovered for navigation and power purposes without serious flooding, raising the proposed pool dangerously, or causing very serious interference with any development near Morrisburg at the foot of the Rapid du Plat.

GENERAL LAYOUT OF WADDINGTON—MORRISBURG SITE. NEW YORK AND ONTARIO POWER CO.

channels through the Galop Rapids. The cross-section of the river between Kingston, Ont., and Ogdensburg, N.Y., is so great that there is less than 1 ft. fall in the intervening 60 miles, consequently the Lake Ontario level is continued practically to Ogdensburg.

Between Ogdensburg and the head of the Galop Rapids (5 miles) the fall is less than 2 ft., and from the head of the Galop Rapids (Lock 27) to Morrisburg, Ont., (Lock 23), the fall is 13 ft. in 16 miles, the total fall from Ogdensburg to Morrisburg being, therefore, 33 ft.

The shores from Ogdensburg to Morrisburg are moderately high and except at Iroquois, no serious flooding would result from carrying the Ogdensburg level down to a dam at the foot of the Rapid du Plat (Morrisburg), due allow-

From the easterly end of Barnhart Island to Cornwall (Lock 15) the fall is 6 ft. and the shores are lower. It is not considered practicable to dam the river between these points.

The river bed is mostly boulders underlaid with hard clay mixed with stones, beneath which is hard limestone rock at a more or less varying elevation. Drilling has been done at different points to determine the surface elevation of the solid rock, and the results are available.

There is every indication that the St. Lawrence River has cut its present channel largely through the agency of ice, in fact the process is still going on and may be witnessed at some point or other between Montreal and Ogdensburg during any severe winter. In bays and quiet spots the ice occasionally attains a thickness of about 36 inches

by direct freezing, though it is frequently many feet in thickness on account of frazil and anchor ice being forced beneath the field ice and firmly adhering thereto. Where the water is in movement ice forms more slowly, though so many factors are involved in ice formation that it is difficult to predict what ice will do, except under known conditions of flow and after long continued observation.

One point to be remembered is that the St. Lawrence flows in a generally north-easterly direction and the canal records disclose that commencing at Lock 27, the farther down stream you go the earlier does ice formation occur in the winter and the later does it break up in the spring.

It is the intention to discuss herein only those points in the engineers report which do not conform to this company's plan of double development described hereafter, or which affect the costs when making comparison with the single development scheme given in the report.

Regulation of Lake Ontario

In any plan for the improvement of the River St. Lawrence the regulation of Lake Ontario is a most desirable feature, and, to the extent that it is practicable, should receive first consideration from both the standpoint of navigation and power. (See Appendix A).

General Plan of Double Development

Consideration of the foregoing description of the river, its ice condition, etc., makes evident that two sites are best adapted for navigation and power works.

The first is at the foot of the Rapid du Plat, near Lock 23, and the second is at the Long Sault Rapids. The Rapid du Plat dam would control the river between that point and Ogdensburg, thereby regulating the surface elevation of Lake Ontario and the discharge therefrom.

In any case, the improvement of river channels for navigation above the Rapid du Plat Site, and the consequent flooding damages are assumed to be the same, as the same pool elevations would be used. The comparative merits of the alternative methods of development therefore depend upon the various factors entering into the subject east of Leishman's Point.

The project herein outlined has the following advantages:

1. It controls the outflow of Lake Ontario.
2. It avoids flooding practically any of the thriving and thickly settled rural communities east of Morrisburg.
3. It provides a deep waterway channel at an early date throughout the whole division.
4. It develops more primary horsepower than any other method, and furnishes over 600,000 h.p. within a short period, to satisfy the present demand for power.
5. It preserves the water front on both sides of the river between Lock 23 and the Long Sault for the location of industries.
6. Provides best and safest conditions for winter operation.
7. Provides a site for both American and Canadian Locks.

In a general way the project would include power houses at Barnhart Island, and the dams necessary to raise the water level to approximately elevation 210, and a second power house combined with structures suitable for the control of Lake Ontario at Morrisburg. Navigation at the lower site will be provided with a canal having a lock at its lower end and guard lock at upper end. At the upper (or Morrisburg) site provision is made for navigation through a canal on the Canadian side with a lock. There is also a practicable lock site on the American side of the river.

All structures would be designed for a definite elevation of water surface, and whatever property is damaged in the flooded area would be acquired at the outset.

The work would be carried out in two stages. The first stage would include all structures at the Morrisburg site. The second stage would include the work at the Long Sault.

It might be impossible, but in any event it would be difficult to construct dams and power houses at the Long

Sault until the discharge of the river in winter is under effective control from regulating works at Morrisburg.

(See Engineers Report on ice conditions with elevation of water surface of Long Sault Rapids in 1918).

If it is found expedient to provide for 20 or 25 ft. navigation through the division before the second stage is completed, then additional excavation might be required in the prism of the Cornwall Ship Canal, and jetties built in the river to raise the elevations of the water surface at the entrance to the canal to some elevation higher than at present.

Structures at the Long Sault Rapids and Barnhart Island

Accepting the general layout submitted in the Engineers Report as applying as far as possible to the double development, the following changes would be required:

(1) The north end of the Barnhart Island power house would be tied into the Cornwall Ship Canal by a short and substantial concrete dam. This eliminates the long dykes and embankments necessary in the single development to tie the power house and canal structures into the high ground on Sheik's Island, and from there into the Canadian main land north of Moulinette.

(2) The crest of the spillway is reduced from El. 1,231 to El. 210, and designed to withstand the pressure from a stage of El. 217 in place of El. 246. All retaining walls and abutments having copings at El. 217 in place of El. 238.

(3) Ice diversion works have curtain wall top reduced in El. from 245 to 217. Power house structures reduced from El. 245 to 217, and designed to withstand 29 ft. less head.

(4) Elimination of all embankments and dykes between El. 243 and 222. Practically all core walls are eliminated.

(5) Hoople's Creek diversion is eliminated.

(6) All embankments and dykes on the Canadian and American main shores are eliminated.

(7) Massena Power House and other works in connection therewith are eliminated. The existing Massena plant of the Aluminum Co. of America would be practically undisturbed.

(8) The length of the Power House would be approximately the same as in the single development, but the construction would be much lighter due to the design being for 29 ft. less head and the decreased weights in machinery.

Similarly for the Cornwall Ship Canal the proposed general layout would be changed as follows:

(1) Lock 7 would be in the same position.

(2) Lock 8 at Moulinette would be eliminated.

(3) Guard locks would be required, but would be moved down stream near site of proposed Lock 8 in the Engineers Report or farther east if necessary.

(4) Canal bank on north side carried to El. 222 as far east as the Guard Lock. Drainage led to Culvert under canal as in the Welland Ship Canal.

(5) Water level in the Cornwall Ship Canal to be El. 210 in place of El. 200, and banks made to correspond.

(6) The approach channel would be required to be extended farther upstream. But this would probably be advisable in any event.

(7) The portion of the Cornwall Canal known as Bargan Lake would be utilized as a supply channel to the power houses, thus relieving the Little River Channel (between Sheik's and Barnhart's Islands).

Structures at Morrisburg and Ogden Island

Since the double development project would require power houses at Morrisburg combined with regulating works and navigation facilities, the layout as given in the Engineers Report would have to be considerably changed.

The channels at and below Ogden Island provide a means of building a large portion of the structures in quiet work. The rock is at a satisfactory elevation.

The large area that may be conveniently unwatered or at least rendered quiet for construction purposes allows various layouts to be made.

The protection that would be afforded by the Islands, and the utilization of the intervening channels during the

winter season for the purposes of both construction and operation offer great advantages to a location in the vicinity of these islands.

It is proposed to submit herein merely a tentative layout for the works, but the following items show that this location is best suited for economical power development in connection with facilities for regulation and navigation.

(1) A large area is available for power houses, spillways and other structures.

(2) Material can be brought by water to the site for a large percentage of the construction work.

(3) Navigation during construction period is taken care of.

(4) Protection from ice during construction is assured.

(5) Sites are available on both sides of the river for locks.

(6) Successful operation of power houses in winter season is assured by the protection afforded by islands, with more than one large channel leading to one forebay and the independent operation of Little River which may be utilized as a relief channel in case of ice congestion in the main channel.

(7) The velocity in main channel a short distance from structures will aid in keeping them free from ice troubles.

(8) Open water during the winter below the structures will tend to prevent ice jams. Winter backwater effects on the plant would be negligible.

(9) The structures required for purely regulating purposes will be less extensive than in the single development. The power house itself affords a large measure of regulation, and the greatly increased head on the sluices gives them an increased carrying capacity.

(10) The risks and uncertainties in prosecuting the work at the Morrisburg site are much less formidable than those in connection with a high head plant at the Long Sault, and contractors would not require to make such large allowances for contingencies.

River Improvement Between Morrisburg and Long Sault

It will be necessary to make some river improvements between Morrisburg and the Long Sault for navigation. This is mainly necessary in order to reduce the velocity, and is relatively not a serious matter. The regulation of Lake Ontario as outlined in appendix A will reduce the maximum velocity that can occur, and hence reduce the amount of excavation below that which would otherwise be required under the method of regulation, proposed in the Engineers' Report. The improvements made in the channel between Morrisburg and Barnharts Island will reduce the slope, and thereby increase the working head available for power plants.

The navigation channel will have the advantage of well defined shore lines, retaining the present high banks in place of the lake-like expanse with wide areas of shallow water and low banks consequent upon the single high head development. It will not require to be buoyed to any great extent, and will give safer navigating conditions during foggy weather, at night and during periods of high winds.

Cost of Machinery

The head available at the Morrisburg plant will be approximately the same as that given in the Engineers Report for the Massena plant, which is put at 29 ft. For this head a type of turbine runner of much higher specific speed may be used than with the high head. This makes the cost per h.p. for the machinery for the double development much closer to that of the high head single development than is indicated in the estimates of the Engineers Report. The weights and heights of the parts of the machinery in the double development will be less than those in the single development, all of which greatly reduces the cost of cranes, runways, columns, etc., per lineal foot of power house.

The foregoing also applies to the Barnhart Island power house of the double development to a certain extent. It

would have an operating head of 53 to 54 ft., and the machinery costs are relatively low per h.p.

In any plan of development the transformers and other high tension transmitting apparatus costs are based upon the k.w. capacity of the plant, and it is immaterial whether his part of the machinery is located in one plant or two.

Flooding Damages

The Engineers Report states that the proposed high head development at the Long Sault be made in two stages:

1st stage—The overflow weirs and regulating works to be carried to El. 231. Power house to El. 250.

2nd stage—The weirs and regulating works to be raised to El. 238. Dykes and embankments to El. 250.

At the first stage of development the maximum power development is impossible, and the flooding is extensive. At the second stage the flooding and backwater effects therefrom are still more serious. This phase of the question is dealt with in appendix D.

Power Development

The Engineers Report gives the total power at the first stage of development as 1,464,000 h.p. and states that a greater amount of power would be generated at the second stage. Owing to unknown winter conditions, however, the additional power obtainable is not dependable. (See pars. 155 and 156 of the Engineers' Report). The double development shows that 1,655,000 primary h.p. can be obtained under similar conditions of flow, giving it an advantage of 191,000 primary h.p. over the first stage of the proposed single development, and a substantial increase over the second stage.

Estimates of Cost

Using the estimates of cost submitted by the Engineers in their report, also their quantities and unit prices so far as they may be applicable to the double development, an analysis has been made of the relative costs of the single and double developments both as regards navigation and power. (See appendix C.) We do not entirely agree however, with the unit prices adopted by them and submit our own estimates (per appendix C1). Opinions may differ widely as to what is chargeable to navigation and what to power, but the method of apportioning the costs is considered equitable.

The Engineers Report makes no allowance for interest charges during construction. As the whole proposition is a commercial undertaking and interest constitutes a respectable percentage of the total amount, it is advisable to provide sufficient to carry on the work to completion. Interest has been computed on the assumption that the single development would absorb 22% of its cost, and that in the double development the Morrisburg works would in like manner take 11% and the Long Sault works 16%.

An allowance of 10% has been made for contingencies, but attention is drawn to the fact that the estimates herein for the double development are liberal, and the contingencies allowed should be a less percentage of the expenditure than in the single development scheme. There is by no means the same element of risk in the two methods of development and particularly that for the Morrisburg structures. Contractors would undoubtedly make due allowance for these risks, and the high specific speeds now being developed for the turbines (particularly for the lower heads) will practically eliminate the necessity of allowing any contingencies for machinery under the double development plan.

An adjustment (or different apportionment) of the channel improvement costs from Galops Rapids to Rapid du Plat should also be made as between the Morrisburg and Barnhart plant in the double development, as set forth in the note attached to appendix C. This reduces the costs of the Morrisburg plant and increases that of the Barnhart Island plant.

The item of land and property damage east of Rapid du Plat in the Engineers Report should be increased as noted in appendix D on flooding. The amount allowed is

insufficient. No such damages occur with the double development.

Conclusion

The advantages of the double development over the single development as proposed in the Engineers Report may be summarized as follows:

1. An old and productive agricultural community (estimated at over 4,000 people) is protected from elimination by flooding and a large drainage area preserved for agriculture.

2. The smaller range in regulation of Lake Ontario together with the higher average stage of the lake is of great value to the lake ports, and also improves river navigation between Lake Ontario and Cornwall. The power capacity of the stream is increased.

3. The river below Morrisburg is improved for navigation and power purposes, but otherwise left in approximately its natural condition as regards its shore line.

4. Navigation for either 20 ft. or 25 ft. draft between Morrisburg and Cornwall can be provided with but little additional expenditure as soon as the Morrisburg site is developed.

5. Moulinette Lock (No. 8) in Cornwall Ship Canal is eliminated.

6. A large stock of power (609,000 h.p.) is made available at a much earlier date, as the Morrisburg development should be completed within four years.

7. Excellent sites for industrial purposes are preserved along the water front extending from Morrisburg to Moulinette.

8. A better distribution of power for operating and industrial conditions, and greater reliability from two sites.

9. Much better ice conditions would prevail during the winter months. This applies particularly to the section between Morrisburg and Long Sault and the operation of the Waddington-Morrisburg power plants, under the layout proposed by the company.

10. The town of Cornwall and the country round about are not menaced by the failure of high earthen dykes and embankments impounding the waters of a new lake some 60 square miles in area.

11. Elimination of many of the most difficult and expensive features connected with the single development, and damages to property well defined from the outset.

12. An enormous saving in the cost of the whole work, both to navigation and power, together with a greater development of primary power.

13. Assuming the Long Sault, development backs the water 2 ft. on the Waddington site, then with a flow of 200,000 c.f.s. the power lost at Waddington site is 40,000 h.p. which capitalized at \$100.00 amounts to \$4,000,000. This is approximately the cost of the proportion of the river improvement between the Galops and Leshman's Point chargeable to power, hence the first stage of development (that is Waddington-Morrisburg site) can very well carry the proportion of the cost of river improvement between Galops and Leshman's which is chargeable to power. After the double development is complete then this cost may be adjusted between the two sites.

APPENDIX A

Regulation of Lake Ontario

Any reduction in the fluctuation of the levels of Lake Ontario under regulated conditions will allow an increase in its average elevation, and a corresponding but much greater increase in the average elevation of the water surface in the pool above Morrisburg dam.

The Engineers Report states that under natural conditions the elevations for the lake varied from 243.41 to 248.95 and the flows from 183,000 to 320,000 c.f.s. The proposed regulation does not materially reduce this range in elevation, and only affects the outflows by raising the minimum to 210,000 c.f.s. making a range of 110,000 c.f.s. under conditions of no diversion at Chicago.

Our studies show that allowing 10,000 c.f.s. for the Chicago diversion it is possible theoretically to keep the

outflow between 200,000 and 280,000 c.f.s., a range of 80,000 c.f.s. for 100% of time and the corresponding range in elevations of the lake will not exceed 2.1 ft. except for 1 month. They also show that practically it is possible to keep the range of regulated flow between 200,000 and 280,000 c.f.s. and the range of elevations at least between 244.6 and 248.95 with only six months out of the period of 60 years having an elevation below 245.3 and within a 2.1 ft. range for 82% of time.

This is a decrease of 27% in range for flows and 30% decrease in range for elevations for lake over those given in the engineers report.

The above quantities are based upon the conditions pertaining during the period 1860-1920 inclusive, but allowing 10,000 c.f.s. for the Chicago diversion.

The effect of increasing the range is shown by the following:

With a two foot range the theoretically possible flow is 200,000 c.f.s. for 100% of the time; 211,000 c.f.s. for 96% of the time, or omitting the low water years of 1895-96 (Aug. 94 to Feb. 97), it is obtainable for 100% of the time; 216,000 c.f.s. is obtainable for 90% of the whole period; 280,000 c.f.s. is the maximum flow.

With a three foot range the theoretically possible flow is 204,000 c.f.s. for 100% of the time, an increase of 2%; 215,000 c.f.s. for 96% of the time, or 100% of period omitting years 1895-96; 218,000 c.f.s. for 90% of the time; 283,000 c.f.s. for maximum flow.

With a four foot range the theoretically possible flow is 206,000 c.f.s. for 100% of the time, an increase of 3%; 217,000 c.f.s. for 96% of the time, or 100% of period omitting years 1895-96; 219,000 c.f.s. for 90% of the time; 269,000 c.f.s. for maximum flow.

With a six foot range, the theoretically possible flow is 211,000 c.f.s. for 100% of the time, an increase of 5 1/2%; 221,000 c.f.s. for 90% of the time; 261,000 c.f.s. for maximum flow.

The above shows that a very small percentage gain in flow is obtained by increasing the range above 2 ft., being only 2% for a three foot range, 3% for a four foot range and 5 1/2% for a six foot range. Any increase in power due to the greater range and its corresponding increase in flow is more than offset by the loss of power due to the lower lake level. The closer regulation is, of course, a great benefit to navigation since it raises the minimum stage of the lake and river as far as the Waddington-Morrisburg site.

Rule for Regulation

It is theoretically possible to maintain the regulated flow between 200,000 and 280,000 c.f.s. and the regulated range within 2.1 ft. A system of regulation may be devised in which these flows will not be exceeded in their limits and still maintain the 2.1 ft. range in lake level for 82% of the time.

These studies have been based upon the elevation of the water surface of the lake and the supply to the lake. Hence, using only this data, it is possible to obtain a high degree of accuracy in the forecast for one month in advance. No doubt any system of regulation will be revised from time to time as additional knowledge of the conditions on the watershed is obtained and as the power load builds up.

Effect of Closer Regulation

The above system of close regulation when applied to so much greater advantage than is possible with the regulated single and double development schemes shows the latter limitation given in the Engineers Report.

The effect of this in comparing the single and double developments is as follows:

(1) To increase the available head for the Morrisburg plant.

(2) This increase in head for the Morrisburg plant is not available for Barnhart Island plant under the single development project as contained in the Engineers' Report. This is due not only to the fixed El. 231 at the Long

Sault, but also to the winter slope of the river between Barnhart and Morrisburg Pool.

(3) That the higher head available for the Morrisburg site in the double development gives higher speeds for the machinery and greater horsepower per lineal foot of power house and other structures, hence a less total cost and less cost per horsepower than is obtainable under the regulation contained in the report of the engineers.

(4) It will be noted that this method of regulation requires less water to be discharged at maximum flow, and consequently less wastage of flood water.

(5) The raising of the average elevation of the lake and the increase in the minimum elevation of approximately 2 ft. is equivalent to dredging the harbors of Lake Ontario and the river down as far as Ogdensburg to that extent.

APPENDIX B

Winter Conditions

The Engineers Report states that it is advisable to operate the reaches between Barnhart and Morrisburg and between Morrisburg and the Galops with an ice cover, but does not state clearly how this ice cover is to be maintained.

Our conclusions are that it would be impossible to maintain a stable ice cover under the proposed single development scheme and that it would be better to attempt maintaining an open channel particularly in the lower reaches. This would be much more easily maintained by the double development plan.

Winters on the Upper St. Lawrence vary considerably. Some are so mild that even the channel between Ogdensburg and Lake Ontario (in which the open season fall is about 1 foot) remains open. Other winters occur in which this reach retains an ice cover for a few days only. During the average winter this section is ice covered.

The section between Ogdensburg and Chimney Island is one in which the velocity is greater than that above Ogdensburg and compares favorably with some of the sections of the proposed channel below the Galops. The lower end of this channel between Chimney Island and the State Hospital frequently chokes with ice coming from the reach above. This reach is only about 4 miles long and supplies all the ice to the above section. It is difficult to believe that much anchor ice occurs in this channel. The result is that the discharge of the river is materially reduced.

The reach between Ogdensburg and Brockville has a lower average velocity than the above and during many winters its closed season is of short duration.

The proposed new channel conditions between Morrisburg and the Galops has several reaches in which it is proposed to excavate in order to reduce the velocity to an average of 4 feet per sec., and the maximum velocity at the surface will be considerably higher. It is difficult to conceive these reaches having a stable ice covering for any large percentage of the winter season.

It must be remembered, that, when considering the ice conditions the average winter and the average ice conditions bear little weight. It is the extreme conditions, the worst that has ever occurred that must be considered. One serious uncontrolled ice jam might wreck the whole proposition.

Mention is made that under the new conditions, the ice cover on the river above the Galops will so warm the water that the Galops will be free of anchor ice. It is difficult to see how the conditions above the Galops will be greatly changed from the present state. The Galops under present conditions do have a large quantity of anchor ice.

Under the single development plan the higher velocities are in the sections a considerable distance west of the dam. This is just the reverse of the condition required for the most successful operation of fighting ice. Invariably the clearing of ice fields must take place from the downstream side.

With the single development scheme the sections next to the dam will freeze first and become the strongest due to the longer period for it to grow in thickness and receive

contributions of ice and snow from reaches farther upstream. The nature of the mass adjacent to the dam is difficult to determine, but it is evident that it may cause a considerable reduction in the discharge of the river and also in the supply to the power house.

Change in Stream Lines

Under winter conditions the flow will have a tendency to concentrate in one part of the channel, thereby increasing the velocity and consequently greatly shortening the life of any ice cover.

Action of Floating Ice

The percentage of border ice that builds up in front of an ice cover may depend to a large extent upon the velocity of the stream at the point of growth. The amount of snow and frazil ice that goes into the accumulation in front of the ice bridge is certainly not so entirely dependent upon the velocity and we cannot agree with some of the remarks of the engineers report on this question.

The capacity of a section of the river for storing ice is not entirely in proportion to its cross-sectional area but depends to a large extent upon the rapidity with which the ice bridge builds up, and the rapidity of the building up of the ice bridge depends upon its facilities for passing the various kinds of ice masses beneath its ice cover. This may be seen at Cornwall or at the bridges which form below Farran's Point or in some of the secondary channels among the islands farther upstream.

Critical Velocity for Border Ice

Our studies of winter conditions along the river do not show that any rigid rule may be made to determine the limiting velocity in a section in order to obtain an ice cover due to growth from shore. There are too many elements involved to make a definite rule. The element of time is an important factor. During a winter with little zero weather or one with alternate cold and warm periods the encroachment of border ice on the midchannel is much less than in a long period of cold weather. The variation in duration of the season for open channel between Ogdensburg and Brockville is a good example of this.

Under the proposed single development scheme an ice cover on the river between Barnhart and Morrisburg will be very uncertain. The following refers particularly to this channel.

(1) The present channel would be changed from its present state of fairly uniform width with comparatively small bays of quiet water and open channel conditions during every winter (except during the periods of 1878, 1887 and 1905 when ice jams occurred) to one of great width with large areas of quiet water and low velocities throughout the reach. Similar in some respects to that at Brockville.

If these bays do not have a permanent ice cover, then the amount of frazil ice manufactured in the reach will be greater than at present. Also the amount of border ice breaking from its anchorage and the frequency with which sections swing out into the main channel may be greater depending to a large extent upon fluctuation of the water stage under operating conditions and the greater effect of the wind upon the wide expanse of the river. On the other hand, if the bays are of more or less permanent nature with an open channel in midstream, then they serve to accumulate the snow which will be swept by favorable winds into the open channel. This snow-ice forms a very disintegrable and difficult mass to handle and even with low velocity currents readily runs under an ice cover. Example: Channel head of Galops to State Hospital below Ogdensburg.

Conditions in a Mild Winter

(2) Consider a winter which is comparatively mild or one in which the periods of severe weather alternate with warm periods. The bays and quiet areas freeze over early in the season to various thicknesses, depending upon the severity of the weather and length of time the water is in an undisturbed condition. The process of these ice areas

breaking from anchorage and floating downstream is often repeated several times.

Change in Climatic Conditions

Consider an average severe winter. Invariably there come periods in December and January when the weather after a lengthy spell of zero temperature, suddenly turns warmer and this may continue a few days or a week. Under these conditions a breakup may occur similar to that described under the previous item on Mild Winter, but with the difference that at the stage when the ice mass is in its most threatening position a sudden change to zero weather might consolidate the aggregation making a repetition of the above a very dangerous matter.

The river between Morrisburg and the Galops has several reaches, namely, at Point Three Points, Point Rockway, Sparrowhawk Point and the Galop channels in which the average velocity approaches closely to four feet per sec., and at all times would be either open or have a very unstable ice cover. These sections are fairly evenly distributed throughout the reach between Morrisburg and the Galop Rapids, so that any condition favoring a breakup of the ice cover would cause these sections to rapidly extend their open water areas until the whole reach opens up in midchannel. The upper end where the average velocities are the greater would open first. Hence the best method of operating the reach between Morrisburg and the Galops is to maintain an open water channel in midstream which will transport (to the reach below Morrisburg) the greater portion of the ice occurring in the reach and thus preventing a congestion similar to that which now occurs between Chimney Island and the State Hospital.

Conditions at the Long Sault Dam

Even if the floating ice is successfully guided over the ice chutes or spillway at the Long Sault dam, it will take considerable water to carry it to Lake St. Francis and prevent a huge mass building up either from the frozen surface of the lake (and this ice surface will take earlier in the upper reach of the lake, due to channel improvements), or the building up immediately below the Long Sault dam. If the spillway is to be used to any considerable extent in winter, then it will add its quota to the accumulation in the lake. Also the shallow portion immediately below the dam will materially augment the contribution to the anchor ice. The rock elevation at the east end of the site of the dam is given as 158 and at the west end 170 and the elevation of the lake surface 154, or only from 4 to 16 feet lower.

Winter Conditions

Winter conditions are such that successful operation of the 4th Division depends upon the ability of maintaining an open channel throughout. The width of the open channel will depend upon the amount of ice to be transported, a greater width of channel being required at the lower end.

With the single development in an average winter, less frazil and anchor ice but more border and snow-ice will probably occur than under present conditions. In a mild winter more border, snow and frazil ice will be formed than under present conditions.

With the double development plan in any winter less frazil, anchor, border and snow-ice will be formed than under the single development plan and less frazil and anchor, nearly the same snow-ice but more border ice will obtain than under present conditions.

Conditions at Power House

The method generally employed in dispersing an ice congestion or ice bridge is attacking the mass from the downstream side and as portions of the ice cover are broken up they are carried downstream clear of the jam. It is necessary to cut this channel of such a width that it will not again be closed by portions breaking from the sides and swinging across before the bridge is dispersed.

Hence a power plant with two or more long channels leading to its ice sluices is in a much better position for fighting an ice congestion in the forebays than a plant de-

pending upon only one. Ordinarily both channels would have a runway for ice but if one chokes up then the other would act as a relief channel, thus giving time for the breaking up of the jam. The advantage of this is evident in the channel at Croil's Island. The great jams of 1878, 1887 and 1905 were caused by both channels at Croil's Island choking. On other occasions one or other of the channels remained open.

The rapidity with which an ice bridge builds up is of course dependent upon the length of channel contributing the ice. In some reaches between Sorel and Montreal this building up is at the rate of a mile per hour. The ice jam of 1905 below Morrisburg built up in the reaches of low velocity quite rapidly. The bridges on the north side of Croil's at times also built up very fast. Another example is the annual occurrence near lock 15 at Cornwall.

The distance from the Waddington-Morrisburg site to the Galops is 16 miles, all of which would be subject to open water conditions, so that under favorable conditions an ice bridge starting at the dam would rapidly build upstream. The layout proposed by the company for the Waddington-Morrisburg development furnishes two independent channels down which ice may be passed. An ice congestion starting at the power house and dam would require to build up a distance of two miles to the junction of the Little River with the North Channel before both channels would be threatened with complete closing. In case one channel did build up this two miles to the head of Ogden, the other channel remaining open would carry the ice contributed by the reaches above, thus giving time to clear the ice choked channel by attacking it at its downstream end. No shutdown of power house would be necessary in order to help clear.

With only one channel leading to power house, this procedure would be impossible and the head of the jam would not be limited to two miles but might advance faster than it could be cleared at lower end, and shutting down the plant in whole or in part would probably be necessary.

If the uncertainties of winter operation make it advisable to carry out the development of power in the 4th Division in two stages, then the section west of Morrisburg should be developed first. In this manner the upper and shorter part of the division (4th) would be changed from its natural state. The lower section from Morrisburg east would be left in its natural condition, the performance of which is well defined.

APPENDIX D

Flooding Damages

The Engineers' Report states that at the first stage of development, flowage will be required up to El. 238, and that at the second stage an emergency elevation of 246 may be reached. This means that both shores of the river will be heavily flooded, and due to the flat slope of the country the drainage area will be affected for a considerable distance beyond, rendering many thousands of acres unfit for agriculture below Morrisburg on both sides of the river.

The villages of Aultsville, Farran's Point and Dickinson's Landing would be badly flooded at the first stage and entirely obliterated at the second stage.

It is proposed to protect the village of Morrisburg by means of a dyke composed of an earth embankment containing a core wall surrounding the village on three sides and pumping the sewerage into the river without making provision for treatment.

The net result of the flooding would be to make the villages uninhabitable by reason of the fact that the farming community which supports them would itself be destroyed, consequently the frontier population from Morrisburg to Dickinson's Landing (inclusive) would have to be removed. The same applies to the American side of the river from Waddington to Massena. Population affected is estimated at over 4,000. The main highways on both sides of the river would require to be re-located at the first stage of development and at the second stage a second re-location

would be necessary in order to afford the remaining farming population necessary access to main thoroughfares and markets. At both the first and second stages the Grand Trunk Railway would have to be raised, and probably portions re-located. Many old and historic cemeteries would be submerged on both sides.

Consideration must also be given to the fact that the compulsory removal of the entire population would entail consequential damages to an amount not easily determinable. In any event the damages direct and indirect would be very great, and the amount allowed in the Engineers' Report does not appear adequate.

APPENDIX C DEDUCTIONS MADE FROM REPORT OF BOARD OF ENGINEERS

	Single Development		Applicable to Double Development	
	Navigation	Power	Navigation	Power
Chimney Island to Morrisburg			\$17,945,630	\$31,554,470
Morrisburg to Cornwall			\$21,556,880	58,731,229
Chimney Island to Cornwall	\$47,002,485	\$97,631,345		
Additional damages	3,000,000	3,000,000		
Engineering & Contingencies	5,000,236	10,063,134	3,950,251	9,028,569

RELATIVE H. P. COSTS.

THE DISINFECTION OF PUBLIC WATER SUPPLIES AND ITS RELATION TO PUBLIC HEALTH

Explains How Typhoid Epidemics Begin — Decrease in Death Rate Follows Use of Chlorine — More General Use of Liquid Chlorine for Disinfecting Water Supplies

By C. A. Jennings

Chicago, Representative, Wallace & Tiernan, Inc.

CHLORINE is a greenish yellow gas, it was discovered in 1774 by Scheele, a Swedish chemist. One volume of liquid chlorine is equivalent to 455 volumes of chlorine gas. Chlorine was formerly produced by chemical means, but, latterly it has been manufactured by the electrolytic decomposition of salt brine. Until recently, chlorine was known principally through its use in the form of chloride of lime (bleaching powder, hypochlorite of lime or hypo). This is produced by the action of chlorine gas upon slaked lime in lead lined chambers. Coincident with the development of the electrolytic method of producing chlorine, there came the development of the machinery for liquifying the gas. As a result, chlorine is now shipped in steel drums of various capacities, including tank cars containing 15 tons. As shipped, it is in liquid form, under a pressure of about 80 pounds, the liquified gas is dry and is between 99.5% and 100% pure chlorine; the variation in the degree of purity being slight. As long as the gas is dry it will corrode few metals.

Hypo Tried as a Germicidal Agent

In 1906 one of the filter companies conceived the idea that drinking water could be made out of the foul, fermenting liquid called water in Bubbly Creek, a branch of the Chicago River. After some ten months of experimenting, work was started on a 5,000,000 gallon per day mechanical filtration plant. Upon its completion, it was necessary to carry on experiments for a long period of time during which all known processes of water treatment were tried with only partial results. As a last resort, in the summer of 1908, experiments were made with hypochlorite of lime or hypo, as a germicidal agent, at the suggestion of Col. George A. Johnson, consulting engineer. The writer was employed at the time as a sanitary engineer by one of the three companies interested in the experiments. The results were extremely gratifying and there followed the development of the process of disinfecting water by means of chlorine compounds, specifically hypochlorite of lime or hypo. Within a month, the water supply of Jersey City, N.J., was being sterilized; soon Little Falls, N.J., adopted this treatment and one after the other, cities all over the United States began using hypo. Before three years had passed, there were more than 500 cities disinfecting their water supplies by means of hypo.

Previous to this development, water supplies that needed purification were treated by storage, plain sedimentation, sedimentation and filtration, coagulation and filtration, etc. If a well water supply or a clear mountain stream or clear lake supply became contaminated, there was only one thing to do, namely, filter the supply even though it was already a clear water, quite often this placed a very heavy financial burden upon municipalities and furthermore, a filter plant required months for construction. Disinfection by hypochlorite of lime found widespread of lime found widespread favor especially in such cases. Furthermore, the standards of sanitary science had increased along other lines and now it was possible to make more stringent regulations regarding the quality of water supplies. The surface water supplies were becoming virtually open sewers as a result of the increased urban population, the sewerage of most communities bordering upon the sources of water supplies and the increasing amount of trade wastes discharged into waterways. Disinfection of water and sewage came at a very auspicious and opportune time. It was adopted as an adjunct to filtration and other forms of water

purification plants. At no time have the advocates of water disinfection argued that disinfection was a substitute for filtration. The principal function of filtration is clarification and incidentally a considerable bacterial reduction takes place but this is not selective as to the kind of bacteria removed. The only function of water disinfection is to kill bacteria and it was soon proven that this treatment had a selective action on the disease producing organisms. This made it an invaluable adjunct to other purification systems.

First Chlorine Control Apparatus Installed

In 1912 the first control apparatus to use liquid chlorine or chlorine gas was installed. The use of a chlorinator handling a pure gas, permitting of accurate knowledge at all times of the quantity of chlorine being used; elimination of uncertainties as to the strength of the chemical being used; overcoming the odor of hypo and its corrosive action on metals; the fact that no chemicals had to be mixed up in solution tanks; lower cost of treatment; the fact that there was no deterioration in the strength of the disinfecting chemical while using or while being stored — all the points showed the great superiority of the use of chlorine over hypo. At the present time there are some 2,000 cities using liquid chlorine for water disinfection and very few still use hypo. In order to conceive the quantity of water is sterilized daily by liquid chlorine, it is estimated that this would be equivalent to the amount of water passing over Niagara Falls in one hour, in other words, about four billion gallons.

Water borne typhoid fever epidemics are on record during many years. They take place even today but there is no excuse for them now, nor is there any excuse for them to assume any degree of severity. Liquid chlorine treatment safeguards against such occurrences.

How Typhoid Epidemics Start

Shortly after Christmas, 1885, a man living above the city of Plymouth, Pa., returned home and took to his bed with typhoid fever. His excreta, unsterilized, were deposited upon the snow covered bank of a mountain brook which emptied into a lake reservoir from which the water supply of Plymouth was obtained. In March there occurred the annual spring thaw. The excreta entered the brook and then the reservoir. The resultant epidemic caused 1,000 cases of typhoid fever and 114 deaths in this town with a population of only 8,000. One person out of every eight had typhoid and one out of every 70 died with it. Continuous disinfection of the water supply at that time would have prevented such a terrible catastrophe.

Two interesting epidemics occurred from a more unusual and more difficult cause to locate, one being at Elgin, Ill., and the other at Bloomington, Ill.; both within the last few years. At the Elgin Watch Co. the drinking water supply from the city mains was pure. An industrial supply was pumped from Fox River for manufacturing purposes, fire protection, etc. This supply was contaminated with the sewage of Elgin and other cities. However, there was a cross-connection between the two systems with a check valve in the line to prevent the river water which was under considerably higher pressure, from being forced back into the city mains. The purpose of the cross connection was to insure the plant fire protection at all times even in the event of the failure of their own private system from Fox River. This is common practice with manufacturing concerns as it enables them to secure a lower fire insurance rate. On one occasion the check valve did not seat tightly and a very serious epidemic occurred among the employees. The damages paid by the company are said to have exceeded \$200,000.

At Bloomington, Ill., the Chicago & Alton R. R. shops had a cross connection with the city water supply. On one occasion their creek supply failed and they pumped for industrial purposes from a 33-in. outlet sewer, the contents being a mixture of sewage and creek water. The check valve between the two systems did not seat tightly and the grossly contaminated water entered the drinking water system. This caused some 400 cases of dysentery, 133

cases of typhoid, and 21 deaths. It is estimated that the damages ultimately to be paid by the C. & A. R. R. Co. will exceed \$175,000. In some states, notably Minnesota, cross connections of this sort are absolutely prohibited by law and the state boards of health make inspections to see that this law is complied with.

Several large manufacturing plants with dual water systems such as the Universal Portland Cement Co. at Bufington, Ind., and the B. F. Goodrich Co. at Akron, Ohio, chlorinate the industrial water supply. Then, if workmen should use this water for drinking purposes, in spite of notices to the contrary, the water would be innocuous and no disease would result therefrom. Most manufacturing establishments find it pays to take this precaution.

Leaky Well Casing at Lansing

The water supply of Lansing, Mich., is obtained from wells in five different sections of the city, all wells being about 450 ft. deep. The mains are all interconnected. It seems that one of the wells had a leaky casing in the summer of 1919 when the river was high. The high river backed up one of the sewers, sewage leaked out through the joints in the sewer pipe, this sewage permeated the soil and found entrance into the suction pipe of the deep well. The entire city water distribution system became contaminated, causing some 3,000 cases of dysentery, 82 cases of typhoid and 11 deaths. Liquid chlorine treatment was installed immediately at Lansing and has been used continuously since that time as a form of health insurance against the possible return of similar conditions.

At Tonawanda, N.Y., warnings had been given frequently for the State Department of Health from 1912 until 1919 to the effect that their water supply from Niagara River should be purified. An accident to the intake precipitated the epidemic about which they had been warned and during the months of July, August and September 1919, there were 236 cases of typhoid. Liquid chlorine treatment was installed after the epidemic had been discovered and this brought it to a sudden termination. It should have been installed at the time the city received its first warning.

Through carelessness, the chlorine apparatus at Alpena, Mich., was not operated for eight days in December 1919 because the supply of chlorine had become exhausted and no attempt was made to replenish it from any city nearby using the same treatment. Nine people paid for this error with their lives and there were 107 cases of typhoid. Civil action was brought against the city and the city manager was discharged. A duplicate automatic chlorinator was immediately ordered to make certain that there should be no cessation in the treatment due to the possible failure of one of the chlorinators.

At Pittsburg, Cal., the chlorine apparatus was out of service for one day a few months ago. It was shut off while making some minor repairs and adjustments. Untreated water was pumped into the mains and no notice was given to the consumers to boil the water. Out of a population of 5,000 there were 100 cases of typhoid even though the apparatus was out of service only one day. Since that time Pittsburg has been sued by 21 people who were sick and the damages claimed amount to \$140,000. A second or reserve apparatus was installed after the epidemic.

In May and June 1920 Greenville, Ky., had 51 cases of typhoid and 7 deaths, and Xenia, Ohio, in August and September 1918 had an epidemic of 44 cases of typhoid fever. In each case this was due to the use of hypochlorite of lime of unknown strength and not having any check on the amount being applied. The Ohio State Health authorities reported: "It is advisable that the company abandon the hypochlorite method of disinfection and employ the more dependable and up to date method using liquid chlorine." Since these two epidemics each city has installed chlorine control apparatus to use liquid chlorine.

Epidemic at Salem

The population of Salem, Ohio, is 10,000. During October and November 1920 there were 6,000 cases of dysentery, 900 cases of typhoid fever and 50 deaths. The

water supply was from wells and had always been considered above suspicion. Sewage found access to an abandoned pipe leading to the common suction well and so contaminated the entire system. The Bulletin of the State Board of Health of Ohio pointed out that giving due weight to the number of lives lost, number of people who were sick and recovered, the funeral expenses, doctor fees, loss of time of wage earners, expenditures for medical services, drugs, nurses, etc., the appropriations made by the State and by the Red Cross, the Salem epidemic showed a cost of \$450,000. Chlorine control apparatus installed after the epidemic cost about \$900 each. The daily cost of treating the entire city water supply of Salem will be less than \$1. To think that with such a small investment for apparatus and an expenditure of \$350 per year the Salem water supply would have been made safe and saved the \$450,000 as well as the lives that were lost. Damage suits aggregating nearly \$300,000 have been filed against the city of Salem as a result of this epidemic.

Even a filter plant requires chlorine as a final or auxiliary treatment. In November 1920 the chemist of the filtration plant at Anderson, Indiana, shut down the chlorine apparatus and allowed it to be idle for 20 days. Following this there were 18 cases and 2 deaths from typhoid fever.

The deep well water supply of Corning, N.Y., became contaminated as a result of a flooded condition of the adjacent river. The inhabitants suffered an epidemic of typhoid fever even though this supply had never been contaminated before and even though it was obtained from deep wells. Since the epidemic there has been installed chlorine control apparatus in duplicate.

Decrease in Typhoid Death Rate in U. S.

In the year 1907 the census registration area showed a population of 41,758,000 with a typhoid death rate of 30.3. In 1919 the rate had decreased to 9.2 and the population canvassed was 85,148,000. This represented a saving of lives equal to 21.1 for each 100,000 population or on the basis of a population for the United States of 110,000,000, the saving amounts to the enormous total of 23,200 lives. In other words, if there had been the same typhoid death rate throughout the country in 1920 as that in the registration area for the year 1907, namely, 30.3, there would have been 23,200 more deaths from typhoid fever than actually occurred. This represents a saving to the country of the enormous total of \$116,000,000.

It is probable that no two water works pumping stations are identical in layout of pumps, pipe lines, etc., nor in the operating conditions. For this reason a special study must be made of each proposed installation of chlorine equipment and the apparatus adapted to the local conditions is specified and the proper method and location of installation detailed. Some conditions necessitate the application of the chlorine as a gas, others as a solution. Often there is no way in which to apply chlorine by gravity and a positive head or pressure at the point of application must be overcome. In larger cities the amount of chlorine used daily may be considerable, comparatively speaking. However, in many of the smaller cities, the volume of the water treated is so small and the dosage of chlorine so slight, that it may entail difficulties in the control of such minute quantities of chlorine. For example, the smallest chlorinator has a minimum capacity of .01 lb. of chlorine per day or in other words, .007 ounce per hour. This is an extremely small amount of gas to regulate accurately. For the average water supply this would sterilize water at a rate of 5,000 gallons per day or about 4 gallons per minute. It is not considered a practicable proposition to try to chlorinate smaller quantities of water.

Some waters with low turbidity, color, organic matter and unoxidizable mineral matter require small amounts of chlorine for proper disinfection, possibly as little as one pound per million gallons or .12 p.p.m. (parts per million). There are highly colored and turbid waters and even some clear waters with large amounts of organic or oxidizable mineral matter that require several times this amount of chlorine for proper disinfection. Here again it is necessary

to make a study of the water to be treated and determined upon the proper rate of application. The average amount of chlorine used on water supplies is probably close to 2.5 pounds per million gallons or 3 p.p.m.

In the regular operation of the water treatment plants it is a very simple matter to determine if the correct quantity of chlorine is being applied without waiting for the results of a bacteriological examination. This is accomplished by testing the treated water for free or excess chlorine by means of the orthotolidin or starch iodide methods. Quantitative results can be secured if desired. At the current price for chlorine, the cost of disinfecting the average water supply will approximate 30 cents per million gallons. Ordinarily, the time period of reaction is very short varying from a few seconds to 15 minutes, depending upon the character of the water being treated, quantity of chlorine used, temperature of the water, etc. Ordinarily the chlorine is applied to the water as it is being pumped into the distribution system, thereby not requiring reaction chambers.

Chicago Uses Chlorine Control Apparatus

The city of Chicago has made a very thorough and exhaustive study of the applications of chlorine to its water supply. There are ten pumping stations taking their supplies from a few cribs, the distances of same from shore varying from two to four miles. The highest recorded death rate from typhoid fever in Chicago was in 1891 when the figure reached 172 per 100,000. Various remedial measures were taken subsequent to this and beginning in 1900, these measures were very effective, such as the opening of the Drainage Canal and thereby diverting the city sewage from Lake Michigan into the Chicago River and eventually the Mississippi River. The first preliminary work of disinfection of the water supply was done in 1912 at some of the cribs. By December 1916, chlorine control apparatus had been installed in all of the pumping stations and since that time all of the water pumped has been chlorinated.

For the period of 1906-1911 before disinfection, the average annual death rate was 14.9 per 100,000. During the years 1912-1916 while experimenting and equipping the stations with chlorinators, the rate dropped 50% to 7.1. For the years 1917-1920 inclusive, while sterilizing the entire water supply continuously the rate has been 1.36, placing Chicago in a very enviable position. It would seem that water borne typhoid fever has been practically eliminated in Chicago. Sanitarians feel that there is a certain amount of typhoid fever called "residual," which may occur in cities with absolutely pure water supplies. Chicago has approached or has possibly reached that stage. The following statements are quoted from "A Report on Typhoid Fever and its Control in Chicago," by Dr. John Dill Robertson, Commissioner of Health, Chicago, dated 1919:

"In Chicago during the first nine months following complete chlorination of the water supply, which was consummated in the latter part of 1916, the death rate from typhoid fever was reduced by 71.44%. Undoubtedly the application of chlorine treatment has contributed materially to the very gratifying reduction which has placed the city of Chicago in the lead of all cities of its class in the United States during the present year. It can be demonstrated that many times the cost of chlorinating the water has been saved to the people of Chicago in the saving of lives and in the prevention of sickness. The use of chlorine in liquid form has now become widely prevalent and is approved by sanitarians and health authorities generally. The marked reduction of the typhoid fever mortality in Chicago shows emphatically the efficacy of the measures employed to control the disease such as the chlorination of the water supply, control of lake dumping, pasteurization of milk, campaign against the fly, etc."

Water disinfection by means of liquid chlorine, although not solely responsible, nevertheless has been in a large measure the cause of the remarkable lowering of the Chicago typhoid death rate. What has been accomplished in Chicago has been duplicated in many other cities in this country where chlorine disinfection of the water supply has

been practiced. A careful study of the typhoid statistics will prove this statement to be true. Liquid chlorine treatment has been one of the most potent agents in the reduction in the typhoid as well as in the general death rate throughout the country during the past few years. This would be in line with the Mills-Reincke phenomenon, which indicates that by eliminating intestinal disorders there is accomplished a material reduction in various other seemingly dissociated death rates. This theory has been pretty generally accepted by sanitarians and many proofs can be cited of it.

Some cities have had specific problems to solve in connection with the disinfection of their water supplies. For example, there are times when the chlorinated water at Milwaukee irrespective of the amount of chlorine applied, tastes so strongly that it can hardly be used for drinking or cooking purposes. Intensive study of this problem has proven this to be due to the discharge of trade wastes into the lake or into one of the rivers emptying into the lake. The first waste which caused trouble was from a phenol or carbolic acid plant. After eliminating this, the taste returned and this time was traced to a gas house on one of the rivers. The plant was discharging coke quenchings into the river and when the wind was in a certain direction, this river which was practically stagnant, polluted the lake and the dissolved matter found its way to the waterworks intake and caused the city water to have a very noticeable taste after chlorination. Remedial measures are being considered at the present time.

Treating Industrial Wastes

At Marquette, Mich., a creosote plant is located a few miles from the city and from the waterworks intake. When the wind is in a certain direction, the chlorinated water develops a very decided taste and odor due to the creosote wastes discharged into the lake. The owners of this plant are owners of one of the largest iron ore companies, and previously refused to treat their creosote wastes to render them less obnoxious on the ground that these wastes are not harmful to the health of the people and in fact they claim that they can prove that a small amount of creosote is beneficial. Moving the intake at Marquette further out into the lake and into deeper water has had no beneficial effect. Recently they co-operated with the Michigan State Board of Health to eliminate these wastes and the results are very promising.

A special use for chlorine was developed at Champaign, Ill., in connection with the Champaign & Urbana Water Co. supply. The water is obtained from wells containing 2.0 p.p.m. iron. Several years ago an iron removal plant was installed and for about two years this gave good results, removing about 90% of their iron. Then there appeared in the mains and reservoir growths of crenothrix. Various expedients were tried and finally liquid chlorine was given a trial. The results were positive and strikingly successful from the start. Beneficial results were obtained immediately on the growth of crenothrix. As a result of these experimental data being so encouraging, a permanent liquid chlorine apparatus was installed and has been in successful operation for several years. This has entirely eliminated the crenothrix growth which was so troublesome. In this case, chlorine was used not as a germicide but to kill crenothrix. Similar installations for crenothrix elimination have been installed at Frankfort, Ind., and Eau Claire, Wis.

Chlorinating Swimming Tanks

During the last few years there have been very notable advances in the subject of swimming pool sanitation. Very radical changes have taken place in the design of pools as well as the treatment of water in the pool. Formerly little consideration was given by the average person as to the sanitary condition of the swimming pool. Now such organizations as the International Committee of the Y.M.C.A. as well as many colleges, boards of education, etc., will approve of no plans for swimming pools without the incorporation of a recirculating pump, filter and disinfection treatment by liquid chlorine. The modus operandi is to

withdraw water from the deep end of the pool by the recirculating pump at a rate sufficient to empty the pool in about 16 hours, the rate depending upon the probable number of bathers, pass this water through a filter for clarification purposes and then treat it with a solution of chlorine on its way back to the shallow end of the pool. This keeps the water both clear and bacterially pure irrespective of the number of bathers using the pool. By this system of recirculation, filtration and disinfection, a large financial saving can be effected yearly in view of the fact that it is not necessary to empty the pool entirely except after a long period of time. Without this system the pools are emptied weekly and in some cases more often. They are scrubbed down, fresh water placed in the pool and this water must be heated from the temperature of the city water up to about 74 degrees Fah. For the average sized pool this will cost about \$20 for the coal alone for each refilling and this does not include the cost of the water nor the labor involved. Ordinarily the entire installation of a pump, filter and chlorinator can be saved in a comparatively few months. Furthermore, the quality of the water in the pool is much better continuously than without this method.

Chlorine disinfection of swimming pools is very satisfactory and very efficient because of its low first cost and negligible operating cost of about 5 cents per day; the fact that the results are positive; it is possible to determine by the previously mentioned chemical tests whether or not the proper quantity of chlorine is being applied; the strength of the chemical is constant; the rate of application can be changed as desired; the efficiency of the treatment is not dependent upon the production of a clear and colorless water as is the case with some of the other methods of pool disinfection and the fact that not only is the water being recirculated sterilized but also this water is charged with sufficient excess chlorine to act as a sterilizing agent upon the entire pool.

Liquid chlorine has been successfully used in the New England states to kill anthrax, a deadly spore forming type of bacteria found frequently in the tanning industry.

Chlorine has been used to a much more limited extent in the treatment of sewage than water. Sewage treatment (purification) is aimed essentially at the elimination of nuisance by reducing the suspended organic matters in the raw sewage and is not designed to effect a bacterial reduction except incidentally. Chlorine is a germicidal agent and as such is used as an adjunct to sewage treatment plants to protect water supplies, shell fish beds, etc. In some cases, chlorine has been used on crude sewage but because of the large particles of suspended matter in raw or crude sewage, it is not recommended as standard practice, although there may be some isolated cases where such treatment is called for.

Thus it will be seen that of the various sanitary measures that have been adopted in recent years, liquid chlorine disinfection of water supplies has been instrumental in the saving of thousands of lives throughout the country by the reduction of the typhoid fever death rate.

The "American City" magazine stated recently: "The city that chlorinates its water supply is providing itself with good insurance against a criminally high death rate from typhoid fever." The Michigan State Board of Health Bulletin recently stated: "City officials are learning that it is much cheaper and safer to chlorinate water supplies than to try to keep the course in a state of natural purity. During 1920 typhoid fever cost citizens of the state more than \$1,500,000. Liquid chlorine water disinfection is a municipal life insurance policy costing a premium of 2 cents per capita per year—an insurance policy that should be purchased by the officials of every city having a water supply to which there is any chance to lay any suspicion as to its sanitary quality. The premium is small—the benefits are immeasurable. Paper read before Minnesota Section of American Water Works Association, Nov. 4, 1921.

J. W. D. Farrell, assistant superintendent of water-works for Regina was the speaker at the regular meeting of the Saskatchewan branch of the Engineering Institute of Canada on Jan. 12.

NEW GASOLINE REVOLVING SHOVEL

THE Bucyrus Company of South Milwaukee, Wis., has just put on the market a gasoline revolving shovel that contains a number of features which are quite new in excavating machinery. This machine which is known as their 30-B gasoline shovel, marks a distinct advance in the design of excavating machinery and it is expected that it will find a splendid market in those districts where coal is expensive or feed water scarce or of poor quality.

This machine is particularly well adapted to suit operations which are intermittent such as gravel pits, clay plants, etc., it not being necessary to keep the machine steamed up whether the shovel is working or not. For a good many years now the dragline excavators made by this company have been operated by gasoline engines but the application of this power to a revolving shovel involved somewhat more difficult and intricate problems, chief of these being the efficient transmission of power to the thrust

without excessive complexity in design, and the obtaining of digging power equal to that of a steam machine of similar size. This new machine possesses the same digging characteristics of the steam shovel with its quick reversals, its powerful thrust of the dipper and its dependability.

Some features which make this shovel of peculiar interest to contractors are the following:

First, it has fewer parts to maintain and keep in order. It possesses the flexibility of the steam shovel even to the shaking of the dipper to relieve it of sticky material. The engine is entirely enclosed and dust proof which is a point worth considering especially in connection with excavating work. It may be equipped as a dragline excavator, a crane, or a clamshell machine with very simple changes which may be made in the field.

Before the shovel was placed on the market it was subjected to a six months tests under practical service conditions working with sticky clay and clearly demonstrated its efficiency.

A bulletin which gives full information together with illustrations of this machine is about ready to be issued. A copy of this will be gladly sent to all those interested.

George A. Goodman, contractor, was elected president of the Builders and Contractors Association of Essex County at the annual meeting held at Windsor on Jan. 10., in the association's quarters, Ferry street. Lorne Lang was elected to the office of vice-president; Harry Turner, secretary, and William Laesser, treasurer. The incoming board of directors consists of George A. Goodman, Lorne Lang, representing the sheet metal contractors; William Crawford, plasterers; J. Walker, general contractors; A. H. Bennett, cement workers; George Bertini, tile; Charles Paddon, plumbing; George Clarke, carpentering; T. W. Brook, painters; W. H. Thompson, bricklayers; F. D. Reaume, electricians; and T. J. Eansor, structural steel.

THE MAINTENANCE OF CLEAN FILTERING MEDIUM IN SEWAGE FILTERS

Describes Use of Insects for Cleaning Sewage Filters. They Eliminate Clogging and Ponding. Forking Not Necessary.

By Herbert D. Bell, A.I.C., F.C.S.

IN view of the research which is being carried on at the present time on methods of sewage purification, without filters—I refer, of course, to the use of activated sludge, whether by the air-blowing method at Manchester, or by the processes of the paddle-wheel at Sheffield, or the screw at Bury—there still remains a wide field of investigation on the possibility of the maintenance of filters, without having to resort to mechanical washing of the material at the end of every ten to fifteen years. It is with regard to the latter subject that I have something to say, which I trust will help other managers to keep their filtering medium clean, in order that sewage filters may continue to carry out the function for which they were designed. My remarks apply chiefly to the media in percolating filters, although contact filters may also derive benefit from the process of cleansing which I am about to describe. As a foreword, this paper does not pretend that all kinds of filtering material will last forever, but presupposes that the material of which the filtering media is composed is able more or less to resist frost and the ordinary natural forces, and is composed of, say, furnace clinker, slag, saggars, and such like media.

On many of the sewage works under your control there may be some filters which are showing signs of clogging up, the first notification of which is generally a ponding of the tank effluent on the surface of the filter. Some of you may have filters which apparently do not seem able to do anything else but pond, and no amount of rest appears to give them any relief. You may also have filters which pond only under stress of work or only during the winter months. To all who have the control of percolating filters with automatic or mechanically driven distributors, or fixed sprays, I suggest a means of cleaning the surface and the lower strata of the media by means of an insect called *Achorutes viaticus*, or the water springtail. In a publication entitled "Insect Life on Sewage Filters" it was demonstrated that this insect would prevent the formation of gelatinous or greasy growths on the surface of circular percolating filters, which cause the formation of impervious layers, thus producing ponding. Further it was also proved that if a filter became so foul on the surface with these growths that it was quite impervious to tank effluent, the addition of these insects caused the breaking up of these growths, and gradually (on complete colonization) brought the filter media back to its pristine cleanliness. It is evident therefore that the presence of these insects extend the life of the filter, and enable it to work for longer periods without rest, and also to produce a higher percentage purification.

The Use of Insect Life

The experiments referred to in "Insect Life on Sewage Filters" were carried out with wide glass tubes for filters, and well graded, sterile cinders, constituting the media, the top three inches being cinders which passed through a $\frac{1}{4}$ -in. mesh, but were rejected by $\frac{1}{8}$ -in., the latter being much finer material than is generally found in practice. At no time did the filter, in constant possession of *Achorutes viaticus* show signs of ponding, although worked at a higher rate than the other filter, which contained exactly similar medium, and grading, but did not possess any of these insects. The latter filter soon commenced to show signs of ponding, which did not disappear with resting, and eventually became quite impervious to tank effluent. On the addition of these insects to the dirty filter, the surface began to clean up, and after a few weeks became quite clean down

to the bottom of the filter. The surface of neither filter was disturbed in any way throughout the whole experiment.

At Stratford-on-Avon the insects appeared on the filters naturally, or rather I should say on one of the filters, and their number increased to such an extent that 133 bucketsful were obtained from the pathway surrounding this particular filter. The other seven filters were treated to 19 bucketsful each, and from February, 1910, to this day, no fork, rake or other implement has been used to lessen the surface of these filters, neither do they show any sign of ponding during the last three or four years before I left Stratford-on-Avon.

These insects did not appear naturally at Barnsley sewage works, but I was able to procure one or two tins full from my friend Mr. D. Robertson, manager of the Darfield sewage works. Some of these insects were put immediately on to very dirty patches on the surface of one or two filters, and the remainder were transferred to the fine surface of an experimental pipe filter, to which was added, by means of a small syphon, tank effluent six days per week for some months. This small filter acted as a colonizing or propagating filter, and from time to time a handful of media containing the eggs of the insect were transferred to dirty portions on the large filters, until at the present time there are three large filters well colonized, and the remaining filters are showing evidence of healthy propagation. None of the nine large circular percolating filters on the Barnsley sewage works have been forked since the summer of 1919, and ponding is gradually becoming less frequent, and is in fact absent on those filters which are well advanced in colonization of *Achorutes viaticus*.

Forking as a Cause of Clogging

It has been somewhat of a passion amongst sewage works managers, immediately a filter began to pond, that it was necessary to fork up the medium at that particular point, and in some instances I have known of forking taking place whilst the filter medium was wet. For many years I have held that forking or disturbing the surface in any way was a fallacy, and further I believe that forking in many cases has been mainly responsible for the clogging up eventually of many filters in this country, and I propose to give you reasons for this assertion.

If a fork is plunged into the medium, and its contents lifted and turned over, as is done when forking a garden, it tends to disintegrate a portion of the growths, so that on restarting work again on the filter after its rest, the finer portions of the medium which are still partially covered with the growths (referred to before) are washed by the tank effluent lower down into the filter, becoming retained by the dirty portion of the coarser material below, which is at a point beneath which the fork will not penetrate on the next occasion. These growths will then start once more to produce an impervious layer beneath the surface. At the same time, the medium on the surface will become pieced together with these growths, thus re-forming an impervious layer on the surface.

With these two layers of growths increasing on two planes one immediately above the other no air can get through, and the result is that no aerobic organisms can live or be propagated, and finally clogging becomes permanent on that portion of the filter, unless some biological force comes into play.

There are on many filters a large number of worms, and undoubtedly they do much useful work in keeping numbers of air-channels open, and also there must be other forms of life other than bacteria which help to produce a state which lengthens the period before actual total clogging becomes general. During resting periods a little disintegration undoubtedly takes place, but the general result is that the growths causing the clogging being out of sight (after forking) are believed to be absent. Thorough disintegration cannot take place without biological forces, and no mechanical loosening of the surface, in my opinion, will prevent the gradual clogging up of the media, which as time goes on renders the filter less useful as a purifying agent,

and finally the whole of the material is taken out and washed or renewed before replacing in the filter.

Some of you may say, "We do not fork a filter medium like we fork a garden." Perhaps you do not. You may insert your fork vertically downwards, and gently prise the handle backwards with a slight jiggling movement, bringing the fork out so as only to sit the dirt in the tight medium. The effect is the same as in the other method, but perhaps tends to delay a little the actual clogging up of the media, as a larger proportion of the fine media remains on the surface; but the sifted particles being coated with some of the growths settle down on the coarser medium below and re-form at a level below which the fork will not reach on the next occasion. Further, the act of forking tends to destroy the original grading of the media, as a properly constructed filter should have from four to six inches thick of its finest grade of material on the top. Forking causes a distribution of the fine particles of the material, coated with these objectionable growths, to intermingle with the coarser material below the surface, which consequently impedes partially purified liquid from getting away from the top layer of the coarser material; and therefore these dirty particles tend to absorb from the partially purified liquid some of its oxidized nitrogen and oxygen, to the detriment of the final effluent leaving the filter.

If for some reason you have been unable to obtain the necessary biological organisms to keep your filters clean, it would be far better to remove entirely the top layer, wash and then replace it after screening, rather than to fork the surface at all. The best way, I consider, is to try to colonize your filters with some form of life, which not only disintegrates and removes objectionable growths which have formed, but will also prevent the re-formation of such growths. Sewage filters, as most of you know, are not straining filters like waterworks filters, but purification is produced by active contact with purifying organisms which can only carry out their functions in the presence of air, and therefore the more porous the fine surface of your filters can be maintained, the more likely will purification be carried on with success, and the life of the filter extended before the ultimate breaking up of the filtering media renders its renewal imperative.

Colonization of "Anchorites Viaticus"

As stated above, the Anchorites Viaticus did not come naturally to the filters at Barnsley sewage works, and, furthermore, the media is such that it does not offer the same cavities for the protection of the eggs and the young insects as ordinary furnace clinkers; yet in spite of this handicap we have been able to get colonization complete on one filter, nearly complete on two others, and evidence of the presence of these insects on the remaining six filters within a period of two years.

The total capacity of all the circular filters at Barnsley is 15,790 cu. yds. These filters deal with a tank effluent whose average dry-weather flow is approximately 1½ million gallons, and as much as 2,900,000 gallons have been dealt with by these filters in twenty-four hours, so that it is possible for other managers with larger works than I control eventually to colonize their filters with this insect, certainly within a period of three or four years.

During the period of colonization it will be noticeable, first, that ponding will become less frequent until it disappears altogether; secondly, that there will be a gradual increase in the volume of tank effluent which the filters will be able to cope with and purify; thirdly, there will be noticed an increase in the percentage purification (after settlement); and, finally, there will be noticed an increase in the amount of suspended matter passing away in the effluent from the filter. Generally speaking, there should be a larger amount of suspended matter in the effluent from a percolating filter than in the tank effluent distributed on to its surface, as, given that the surface is porous, particles of suspended matter in the tank effluent should be able to pass through, and in addition there will be a breaking up of the colloidal matter in the tank effluent, a portion of which will be changed into suspended matter.

These are signs of partial colonization while the filter is at work, and when it is resting it will be noticed within three days (on circular percolating filters) that concentric rings appear on the surface of the media. These rings are of two varieties, the one being clean and the other dirty or discolored. On examination of the material with a pen-knife immediately below the surface of the clean ring, either there will be found large numbers of the insect at work, or there will be found large numbers of its white cast or sheath, showing that the adult insect has moved to a portion of the media where there is more food—that is, where there is a greater deposit of the growth which has been the immediate cause of the dirty appearance. At the place where these white casts or sheaths are found, the eggs of the insect can be seen with the aid of a small magnifying glass, and appear to be in packets of small yellow globular cells. As resting continues and colonization has become more complete, the whole surface of the material will appear to be even cleaner than it was before placing in the filter, and also several inches below the surface will bear out the same result. If colonization is approaching its zenith, large numbers of these insects will pass out with the effluent from the filter, and as the insect is capable of standing on the surface of a liquid by means of the hairy ends of its legs, it is an easy matter to collect them in a ladle or bucket with the effluent for distribution on filters where their number is not so numerous. Abstracted from paper read at the Annual Meeting of the Yorkshire District of the Association of Managers of Sewage Disposal Works.

BUILDING RECORD IN DECEMBER

CONSTRUCTION activity in Canada during the month of December, amounted to \$19,118,500. This is the second largest December total on record, being exceeded only once, and that in December, 1912, when \$31,125,528 was expended. The figures for the different provinces are as follows:

	No. Projects	Value
Ontario	732	\$8,959,900
British Columbia	147	5,197,000
Quebec	187	2,995,900
New Brunswick	13	1,147,500
Manitoba	17	342,600
Nova Scotia	36	198,600
Alberta	13	139,500
Saskatchewan	15	137,500

Total for Dominion 1,160 \$19,118,500

Work reported during December for the first time as contemplated totalled \$13,997,800. The figures for the Dominion are as follows:

	No. Projects	Value
Ontario	251	\$8,790,700
Quebec	265	2,627,000
Western Provinces	51	2,124,100
Maritime Provinces	16	456,000

Total for Dominion 583 \$13,997,800

The value of construction contracts awarded throughout Canada during 1921 was \$240,133,300, compared with \$255,605,500 in 1920; \$190,028,300 in 1919, and \$99,842,100 in 1918. However, if price recessions in material and labor costs are taken into consideration, the volume of new construction undertaken during 1921 was many millions of dollars greater than the 1920 total.

Canada has undoubtedly passed the worst stages of depression and is now on the up-grade. Activities in the construction industry are sign-posts of conditions throughout the country. During the last four months this industry has revealed extremely encouraging indications. Knowing that the costs of building at the present time have been considerably reduced, those who have for some months intended building are asking for new tenders on their proposed work. Building contractors and builders' supply people are making a special effort to reduce prices to a minimum, to restore this important key industry to its pre-war proportions.

TESTS ON CARBONIZING IRISH PEAT

TECHNICAL Paper, No. 4, issued by the Fuel Research Board, London, England, gives the results of two tests on the carbonization of Irish peat carried out at the Fuel Research Station in vertical gas retorts with steaming. It is stated that the peat, after suitable treatment, lends itself admirably to carbonization both in vertical retorts at temperatures between 750 and 850 deg. C., and in steel retorts at 550 deg. to 660 deg., and that the resulting charcoal is an ideal fuel for suction gas producers.

The peat was macerated, spread on the bog, air-dried, and harvested at Turraun in 1920, and early in 1921 100 tons of it were delivered at the Fuel Research station, in the form of hard blocks about 10 in. long with a cross-section about 2 in. square. Their density was rather under 1, or about twice that of the ordinary hand-cut sods made on the same bog. They could be sawn and cut like hard wood, and had stood transport with very little breaking up into "smalls." On arrival they had a water content of about 25 per cent., but by the date of the tests this had been reduced by storage under cover to 17 per cent.

Conditions of Carbonization

For the most part the peat was prepared for carbonization by passing it through a coal crusher. Quantities of light dust were thus formed, and were not separated but were passed into the retorts. This dust gave trouble owing to its being carried forward by the rush of gas into the gas main, where it formed a thick mass with the tar, and on one occasion caused a serious blockage. The first test, which was carried out at a temperature of 1,000 deg. C., lasted 18 hours, and 11.01 tons of peat were carbonized, all four retorts of the setting being used. A throughput of three tons per retort per day was aimed at, and the quantity of steam supplied to the base of the retorts was sufficient merely to quench the coke before it was extracted. For this purpose six per cent. of steam by weight of the coke carbonized was found to suffice. Under these conditions the volume of gas passing away from the top of the retorts was very great, so that a positive pressure in the retorts and mains was avoided only with difficulty. In the second test, which was made at 800 deg.-900 deg., and lasted 52 hours, 12.39 tons of peat were carbonized, but only two retorts were used, so that the strain on the exhausting arrangements was lessened.

The coke or charcoal came out in very much the same form as that in which the peat entered the retorts but greatly reduced in volume. Its weight was 27 per cent. of the peat as charged, and its ash content was nearly 10 per cent. The amount of dust in it was not excessive. As discharged it had a calorific value of 11,380 B. Th. U. per lb. in the first test and 12,210 B. Th. U. in the second, the corresponding figures dry being 12,560 and 12,650 B. Th. U.

In the first test the yield of gas was 14,900 cu. ft. per ton of peat, with a gross calorific value of 325 B. Th. U. per ft.; in the second, 13,760 cu. ft., with a calorific value of 340 B. Th. U. Owing to its high content of carbon dioxide (about 9 per cent.) the gas was very dense, but it burnt with a satisfactory flame, though with only slight luminosity. It gave out a heavy sickly odor on combustion. An attempt to scrub out the condensable gases was rendered rather difficult by the high carbon dioxide content, but a quantity of light spirit was collected in this way, equal to one gallon per 7,000 cu. ft. of gas, or nearly two gallons per ton of peat.

Tar and Liquor

The condensing and separating arrangements intended for coal tar and liquor were found unsuitable for the peat tar and liquor, and the peat tar being lighter than the peat liquor, special arrangements had to be made for collecting it. The gas and vapor entered the water-cooled condenser at 80 deg. C. In order to prevent an unmanageable quantity of tar and liquor from going forward with the gases it was necessary to reduce this temperature on leaving the condenser to about 20 deg. C. This was well below the

settling point of the tar (40 deg.), so that the liquid issued from the condenser in the form of a yellow emulsion. This had again to be heated up to about 50 deg. in order to obtain separation into peat tar (a black oily liquid) and liquor. On cooling to atmospheric temperature the tar set into a black semi-solid mass showing crystals of paraffin wax.

The volume of liquor collected per ton of peat carbonized was large, and therefore low in ammonia content as compared with normal gas liquor. In color it was a clear bright yellow, becoming dark reddish after standing for 10 litres of the liquor, first in acid solution and finally over some time. By continued fractional distillation of about lime, a small quantity of spirituous liquid was obtained, having a specific gravity of 0.812 and containing chiefly methyl alcohol and acetone.

The peat tar was fractionated in the usual way from a half-gallon iron still, and the fractions 0-170 deg. C., 170-230 deg., 230-270 deg., 270-310 deg., and above 310 deg., refined separately. The last two fractions, which were practically solid at 10 deg., contained almost all the wax, only a small percentage remaining in the pitch. A separate portion of the tar was subjected to steam distillation, and a yield of light spirits (unrefined) was obtained equivalent to 5.2 gallons of 0.866 specific gravity per 100 gallons of tar. This spirit, after refining and distilling to 170 deg., gave a purified spirit equal to 32.5 per cent. of the original distillate. This is equivalent to 1.7 gallon of purified spirit per 100 gallons of tar, or 0.36 gallon per ton of peat carbonized. The remainder of the steam distillate on refining gave a further 0.7 gallon per 100 gallons of tar and distilled up to 210 deg.

Yields Per Ton of Peat

The following table shows the various yields per ton of peat as charged:

	Test No.	
	1	2
Coke		
Cwt.	5.38	5.40
Gas		
Cubic feet at 30 deg. F. and 30 in.	14,900	13,760
Therms	48.4	46.8
Tar		
Gallons (dry)	12.6	21.3
Refined spirit (gallons) ...	—	0.36
Oils (gallons)	7.8	15.1
Paraffin wax (lb.)	8.2	13.7
Pitch (lb.)	43.4	53.7
Liquor		
Total gallons	95.5	87.5
Ammonium sulphate (lb.)	29.2	24.8
Methyl alcohol (lb.)	1.53	1.44
Acetone (lb.)	—	1.14
Acetic acid (lb.)	8.35	7.49

The retorts were heated quite satisfactorily by a portion of the peat gas made during the tests, the amount required being about a third of the total or 3,480 cubic feet per hour in the first test. Therefore on a throughput of 3 tons per retort per day it will be seen that after supplying sufficient heat for carbonizing the peat there remained for disposal from each ton of peat 26 therms (7,940 cu. ft. of gas of 325 B.Th.U.), 12.6 gallons of tar, 95½ gallons of liquor of 3.6 oz. strength per ton, and 5.4 cwt. of charcoal.

R. O. Wynne-Roberts of Frank Barber & Associates, Toronto, and sewage engineer of York Township, stated at a meeting of ratepayers held in Todmorden on January 10, that Toronto is in a position to take care of the York Township sewage but that they cannot turn the storm sewers into the city pipes or it would flood the precipitating tanks of the city. He said that the city was considering a plan to handle this difficulty, and as soon as they made their plans known the township would be in a position to make them a proposition.

FACTORS DETERMINING THE SELECTION OF PAVEMENTS FOR STREETS

Character of Traffic Must Be Considered and Also Climatic Conditions. City Pavements Must Be Durable And Easily Repaired

By C. M. Pinckney

Chief Engineer Dept. Public Works, Borough of Manhattan

THE first factor and the most important in my opinion, is a thorough and complete study of the use to which the pavement is to be put. A traffic census should be taken to determine the volume, density, character and speed of the traffic. The distribution of the traffic is also an important matter. The division of the traffic into motor and horse drawn vehicles; what percentage is on steel tires; the percentage on rubber tires; the percentage of pleasure vehicles and percentage of business vehicles, are all factors which enter into the selection of a type of pavement. If there is a great deal of parking of vehicles on a street this also has a bearing upon the type of pavement to be selected.

Grades of Streets

The next factor to be considered is the grade of the street. Streets with heavy or steep grades can never become main arteries of travel. The traffic conditions thereon, however, can be materially improved by the selection of a proper type of pavement. For instance: When a grade exceeds 5% a very careful study must be made of the character of traffic using the street so as to provide proper traction. It is a good policy to restrict the use of smooth pavements such as asphalt and wood block to grades of 5% or less. We have asphalt pavements, however, on grades as high as 7% and they are giving satisfaction. No city street should be constructed to a grade above 10%.

In connection with the selection of a type of pavement for a street where the grade is involved, consideration should be given to the question of skidding. If the traffic on the city streets is to move without interruption a non-skid pavement should be provided.

Climatic Conditions

The climatic conditions obtaining in a city should be borne in mind when selecting types of pavements also. In a city where severe winters are encountered pavements should be laid which will permit readily of the removal of snow, which will not be affected by cold, and which will not be unusually slippery when the temperature is low.

Noise on Streets

In selecting a type of pavement for a street upon which there are schools, churches, hospitals, dwellings and offices, noise is a most important factor, and quiet must be provided. Where manufacturing and industrial establishments are situated the noise element is not such a great factor. Quiet streets, so constructed that they will assure maximum comfort to brain toilers, are essential in a large city. Noise interferes with the health of persons who work with their brains, and it interferes also with the health of persons who, having worked all day with their brains, must sleep at night.

The zoning of cities into residence and business use aids the engineer very materially in the selection of pavements by insuring the character of the occupancy of the abutting property as well as the use of the street. The business interests in large cities have a tendency to concentrate into districts. For instance, in New York City in the Borough of Manhattan, the insurance district, the financial district and the dry goods district can all be clearly traced, and the produce, butter and eggs, silks, woolsens, cottons and yarn industries can be traced into districts. This helps materially in the selection of a proper type of pavement.

Durability of Pavement

A pavement in a city, in order to be satisfactory must be durable. It must be durable because the repaving of a street seriously interferes with business, interrupts traffic,

and produces general inconvenience. Therefore, the more durable the pavement the less interruption to business, etc. In addition to being durable, a city pavement must be easily repaired; that is to say, it must be possible to effect a quick and prompt repair, and one which will blend in harmoniously with the original pavement and be satisfactory in every way. The pavement which is not readily repaired, or a repair which has to be barricaded over any length of time, is not suitable for a city pavement.

Sanitary Problem

Pavements which are porous or which are composed of materials which are apt to rot or disintegrate under city traffic, are not sanitary. The pavement with open joints is not suitable for use in the city also because of its unsanitary features.

Cost of Pavements

In a large city, it is my opinion that the first cost of the pavement is not the determining factor. Where, however, there are several types of pavement from which to make a selection wherein all of the other factors are equal, the cost then might be made the determining factor. The writer believes, however, that the use of local materials in so far as it is possible should be taken advantage of. Paper read before the City Paving Conference, Philadelphia, Oct. 20-21, 1921.

STRUCTURAL STEEL FOR BUILDING WORK

CANADIAN Allis-Chalmers Ltd., Toronto, have supplied "The Canadian Engineer" with the following prices of structural steel for building work.

"The reduction in steel prices during 1921, has been so marked that we make the following comparison for shapes and plates, f.o.b. Toronto, as "Warehouse" material.

	Shapes	Plates
Dec. 1920	\$4.70	\$4.80 per 100 lbs.
Feb. 1921	4.40	4.50 per 100 lbs.
Apr. 1921	4.10	4.10 per 100 lbs.
July 1921	3.80	3.80 per 100 lbs.
Dec. 1921	3.35	3.35 per 100 lbs.
Jan. 1922	3.00	3.00 per 100 lbs.

The above prices, for plain sections, include exchange, customs and freight, i.e., f.o.b. Toronto.

Mill base prices are now 24% higher than in 1914, while labor is over 70% higher than 1913 for steel production. From this we assume that present selling prices are at "rock bottom" and unless the curve lines representing cost at mill and labor for same soon have a closer relation, a small increase is more likely in the selling price than a lower rate.

Our total reduction in 1921 was about \$34.00 per ton. Lower exchange and freight may still be effective."

SOCKETS FOR TELEGRAPH POSTS

WITH the object of prolonging the life of timber posts such as are used for telegraph, telephone, and electric power cables, an ingenious type of reinforced concrete socket has been introduced in France. The socket is constituted by four vertical members, of which the lower part is inserted in the ground to a depth of from 2 ft. 9 in. to 3 ft. 9 in., and the upper part, projecting to a height of from 3 ft. to 4 ft., constitutes a support for the base of the timber post. The latter is kept at a height of 12 in. above ground level, and in consequence is completely exposed to the air. The vertical members are connected at each end by a circular plate and at the middle by an octagonal base, which is at ground level when the socket is in position. The upper plate is formed with a hole corresponding in diameter to that of the post to be inserted, the lower end of the post being tapered to fit a conical hole in a ring moulded above the octagonal base plate. In addition to its employment as a means of prolonging the life of new posts, the socket can be applied for the utilization of old posts, which have been removed prematurely owing to decay of the part embedded in damp soil.

HIGHWAY DEVELOPMENT IN ONTARIO

Minister of Highways and Chief Engineer Explain Policy and Methods of Construction Followed on Provincial System

SPEAKING before the Toronto branch of the Engineering Institute of Canada, on Jan. 12th, Hon. F. C. Biggs, Minister of Public Works and Highways of Ontario, and George Hogarth, Chief Engineer of Highways, outlined the policy of road development and the methods of highway construction being followed on the provincial system.

Hon. Mr. Biggs, in introducing the subject, stated that until a few years ago, the general standard of highways in Ontario was far below that which should obtain in an old and progressive province. Every effort is now being made, with the assistance of a staff of over 50 engineers, to raise the standard to a satisfactory level.

The speaker traced the growth of the good roads sentiment in Ontario. With the passage of the Highway Improvement Act, some 20 years ago, a systematic plan of education was adopted to encourage municipalities to take advantage of the aid offered. In many instances good roads by-laws were voted down and public officials had to renew their educational work. Last year the county of Peterborough, the last county in Ontario to do so, came into the scheme.

Effort is being made, said Hon. Mr. Biggs, to reconstruct important roads to carry the heavier and more exacting traffic brought about with the advent of the motor vehicle. The first care should be the drainage and sub base, but the public, impatient for a hard surface to travel upon, is disposed to abuse the highway officials until it gets it. In the reconstruction, dangerous curves are being eliminated, and standard grades adopted. There are now about 100 miles of highway on the provincial system that are nearly to the stage of hard surfacing, or to the point where those in charge will get credit for their work. In 1921, about 75 miles of road, on more than twice the length of the Toronto-Hamilton highway, which took 7 or 8 years to build, were constructed. The Minister expressed the hope that still more would be built in 1922.

In this work, said Hon. Mr. Biggs, the engineer was needed from the layout of the road to its completion. Only first-class engineers should be employed, and he was glad to say that in 1920, due to his action, it had been enacted that county road superintendents should be graduate engineers. In the provincial organization responsible for over 1800 miles of roads, there is a minister, a deputy-minister, a chief engineer, and three district engineers in charge of the districts of Eastern Ontario, Central Ontario and Western Ontario. A resident engineer is responsible for 80 to 90 miles of road. The speaker warmly commended the engineering staff for its tact and efficiency in dealing with the difficult situations that constantly were arising in the work.

Some new questions now pressing for consideration were the protection of railway crossings by grade separation and the carriage of lights on all vehicles. The speaker thought a law requiring the latter throughout Ontario might be necessary.

Hon. Mr. Biggs then discussed the possibility of highway improvement in the Toronto district and around other populous centres in the province. He pointed out that great loss and inconvenience arose through having to force products on the market too early in order to avoid the muddy season. He looked forward to the time when Niagara fruit would be laid down by motor in Toronto the morning after it was picked. Such a development would be profitable both to the producer and the consumer. He regarded the motor vehicle as having an economic range of 100 miles and the horse-drawn vehicle of only 8 to 10 miles. In the next ten years, said the Minister, freight would be handled very commonly by motor truck over distances of up to 50 or 60 miles.

An important incentive to the improvement of highways was the tourist traffic, according to the speaker. Last

year the fifth largest source of income in the province was this traffic.

Mr. Hogarth, following Hon. Mr. Biggs, described in a very effective manner, with the aid of a fine collection of lantern slides, the engineering and constructional features of the work done by the Highways Department.

Previous to the meeting, Hon. Mr. Biggs, W. A. McLean, Deputy-Minister of Highways and Mr. Hogarth were entertained at dinner by the executive of the branch.

TOWN PLANNING COURSE STARTS AT UNIVERSITY

SIX municipalities outside Toronto are represented in the membership of the new extension course in civics and town-planning, which opened on Jan. 9 at the University of Toronto. These are New Liskeard, Oshawa, Galt, Hamilton, Port Colborne and Brantford. The majority of those registered, however, are architects and civil engineers from Toronto. The number enrolled on the first day was 41, but it is expected that more will arrive within the next few days.

While registration was in progress General Mitchell, Dean of the Faculty of Applied Science; Prof. Adrian Berrington, of the Department of Architecture; W. J. Dunlop, Director of Extension, and others, met the members of the class informally.

The course began with an address of welcome by Sir Robert Falconer, who said that it had been felt for some time that the university should do something in the way of fostering the study of town-planning.

"In this young country," he pointed out, "there is still time to arrange our towns and cities so that they will be at once useful and beautiful."

Speaking of the case of Toronto, where it seemed almost too late to do as much as should be done, he said that improvements are being made and will be made. He drew attention to the way Halifax had been planned since the explosion disaster.

In closing, he bade them a most hearty welcome to the university, and expressed the hope that they would have a very pleasant and profitable time for the next two weeks.

The Chairman, Prof. Berrington, then called on Dean Mitchell, who said that, while this course had been initiated by Prof. Berrington, he thought the idea had really originated with Sir Robert Falconer some years ago, when he expressed to him his wish that the Faculty of Applied Science might do something along this line. The Dean then discussed the reasons underlying the growth of various Ontario cities and towns, comparing them with the cities of Europe.

Prof. C. H. C. Wright of the Department of Architecture welcomed the class on behalf of his department, and expressed the hope that the course would be the beginning of a series of annual courses of this kind.

The real work of the course began with a lecture on "Maps and Plans," by Prof. W. M. Treadgold of the Department of Surveying. A. H. Chapman, of Toronto, also spoke on architectural treatment. This was followed by a second lecture on maps and plans, the final hour being given over to question and discussions, under the supervision of Prof. Berrington.

TOWN PLANNERS HEAR SCHEME FOR CENTRAL DEPOT

THAT the most important factor in determining the future development of the city plan of Toronto is the location of the railroads and their terminals, which, if they were situated where the present C.N.R. North Toronto line is, would be more convenient to the citizens, and would permit of the development of a park waterfront with an uninterrupted view of the bay and island, was the view expressed by J. P. Hynes, President of the Ontario Town-planning and Housing Association, speaking on the future of Toronto before the members of the short course in civics and town-planning at the University of Toronto on Jan. 10.

"Toronto gives evidence of tending to expand fairly evenly in all available directions, now that the natural barriers are being overcome by such means as the Bloor street viaduct and the natural and artificial ones by the consolidation of the street car system.

"A particular tendency of the development is for the Wells Hill elevation and the C.P.R. track between it to develop a line of demarcation between the business and industrial city on the south and the residential city on the north. Therefore, if the North Toronto C.P.R. line be developed as the transportation backbone of the city, very orderly town-planning may be obtained, quite in keeping with the trend of the present development of the city.

Mr. Hynes then went on to explain the workings of such an arrangement of the railroad lines, choosing the site of the central union depot between Yonge street and Avenue road, and supplementing it by sub-stations along the line. Streets running north and south would pass over the railway development without interruption, lessening rather than exaggerating the present objectionable grade.

"The development of this traffic backbone between the industrial and residential city would overcome the necessity of the proposed viaduct across the waterfront, and permit of it being developed into what should be Toronto's outstanding attraction, a park waterfront.

Speaking on transportation within the city, A. E. K. Bunnell, Engineer to the Toronto Transportation Commission, said that the growth of the city was not north and south, but east and west, and that the big movement of traffic was east and west.

"Bloor street," he continued, "is the strategic position to serve traffic. It is bound to be a business street, and if we do not widen it now stores will spring up to prevent us in the future.

"We have got to put the Bloor street widening through this year, even if we do nothing else in the way of improvement," he declared.

INTERNATIONAL JOINT COMMISSION RECOMMENDS 30-FT. CHANNEL

IMPROVEMENT of the new Welland Canal between Lake Erie and Lake Ontario, as well as the St. Lawrence River, to provide a 30-ft. channel from Lake Erie to the sea, has been recommended by the International Joint Commission in its report on the proposed Great Lakes-St. Lawrence waterway, according to Representative W. W. Chalmers, Republican, of Ohio.

Mr. Chalmers, on Jan. 11, introduced a bill in the House authorizing the improvement on the part of the United States, but stipulating that the expense be borne equally by the United States and Canada, through a bond issued, guaranteed by both governments.

The report of the commission, which has been submitted to the State Department, but has not yet been made public, Mr. Chalmers said in a statement, recommends that the project, including the widening and deepening of the new Welland Canal, be undertaken, and that the cost be met through taxation by the United States and Canada, in proportion to the benefits derived.

The commission's report, Mr. Chalmers said, recommends that the division of costs be figured on the basis of known traffic for the past five years, to be definitely ascertained by an international survey.

"I believe such a procedure is too indefinite and intangible to be used as a basis for determining the allocation of the costs of the enterprise which will run into the hundreds of millions of dollars." Mr. Chalmers declared that "each country should pay an equal amount."

The Chalmers bill provides that bonds issued for the Government should be retired with proceeds derived from the sale of hydro-electric power made available for commercial use by the improvement. The measure also provides that the benefit derived in the way of hydro-electric energy shall be evenly divided between the two countries.

Jurisdiction over construction and operation of the entire waterway under the Chalmers bill would be in the

hands of an international board of six members. Three representing the United States and three Great Britain. The board would have authority to sell hydro-electric power and to issue bonds for the improvements.

AVOID TOWN PLANNING MISTAKES OF TORONTO

EVEN small communities should begin to plan for the growth which will inevitably come instead of allowing it to take its own haphazard course, was the idea that Prof. C. H. C. Wright, head of the Department of Architecture, University of Toronto, gave in a lecture to the students of the short course in town-planning on Jan. 11.

"The small community is the seed of the big town," he said, "and if we can start the sapling growing right, the big tree will grow right, too.

"But, if by reasons of survey, by ignoring the topography of the land, by individual caprice, we allow the sapling to grow up wrong, we will not be able to do anything with the tree.

"Toronto began on the low land, following the concession lines along Yonge street until those lines became solid with buildings. Instead of having a city on a fine site, it tries to extend and grow as though that site had no other qualities than that of a flat plane. Ravines, instead of being emphasized and exaggerated as magnificent winding parkways, are, wherever possible, ignored. We take our roads up the hill in most cases at the steepest possible grade.

"Exactly the same absence of thought and prevision are to be found in the places that consist of one grocery, a few shacks, possibly a meeting house and a school. These places, chiefly by reason of their varying topographical conditions, have each a character of their own.

"The proper idea for every place might be roughly defined to be as different from the places around as possible. Then every settlement, no matter how small, will be able to boast that in some respect or respects it is better than any other place."

ONTARIO LEADS IN TOWN PLANNING

SPEAKING on the results of the Federal Housing Loan in the Dominion before the members of the Short Course in Town-planning at the University of Toronto on Jan. 12, W. D. Cromarty of Ottawa stated that Ontario had availed itself of the loan to a far greater extent than any other province, and that, on the whole, the efforts of the various Ontario municipalities had met with success. He showed many pleasing examples of modest house building in various parts of the province, together with one or two American examples and said that Canadian endeavors were, on the whole, superior.

Mr. Govan of the Parliament Buildings, well known in housing circles, said that he was pleased to see that on the program the word Ontario had been stressed, because our ideals in small houses were apt to be turned by the influence of American journals toward houses suitable to Florida and California, but totally inappropriate to a province that has to consider its coal bill for six or eight months in the year.

He pointed out that by proper attention to maximum exposure to the south, together with the employment of insulating devices and materials for the walls the coal consumption of every six-room house in the province might be reduced by two tons.

J. B. O'Brien explained how many difficulties even under existing imperfect legislation might be overcome by a body of citizens really determined to better their city.

H. L. Seymour continued the subject of zoning, which means the sorting out of a city so that each part of it is assigned to and designed for certain definite functions. Under this system there would be more or less defined business areas, factory areas, residential areas of various types, etc.

Prof. W. M. Treadgold exhibited motion pictures showing the actual processes of modern road building.

LETTER TO THE EDITOR

Sir: I beg to acknowledge receipt of your card of January 4, calling my attention to an item appearing on page 4 of the issue of "The Canadian Engineer" for December 29, 1921. I would like to have this item corrected, because, as it stands at present, it gives a wrong impression.

My proposal to the city of Brandon is that, if the commission undertakes to supply power to the said city, by means of a transmission line from Winnipeg to Brandon, at a total expenditure (including terminals) of about \$1,200,000, the following conditions would rule:

The city of Brandon to guarantee to the Manitoba Power Commission the fixed charges plus the actual cost of the power for any amount used.

Basing the rates on the figure given and with the conditions as stated, the actual cost to the city of Brandon would be as follows:

Consumption of 3,000,000 k.w.h. per year, the	
cost per k.w.h. would be	6.5 cents
Consumption of 4,000,000 k.w.h. per year, the	
cost per k.w.h. would be	4.7 cents
Consumption of 5,000,000 k.w.h. per year, the	
cost per k.w.h. would be	3.85 cents

Taking either first, second or third schedule, the return, at the price stated, would cover the fixed charges for the full year of operation, and any amount over that scheduled would be taken at actual cost of power. As a consequence, the power consumed, above the stated amount, would cost the city of Brandon in the neighborhood of 1c per kilowatt hour, thus permitting the city to sell power at a very low rate, after having fixed a rate for lighting purposes that, as proposed, could be set at between 6c and 7c.

At the present time the actual consumption by the city of Brandon is somewhere about 4,350,000 k.w.h. per year, at 12c per k.w.h., and there is no doubt that with the reduction in rates this consumption would be doubled by the end of the first year, and that the load would increase from year to year.

You will see, therefore, that the item referred to does not give an accurate idea of the situation or my proposition, and I would like, if it could be managed without undue convenience to you, that the said item be corrected in accordance with the figures given herein.

I remain,

Yours very truly,

T. ROCCHETTI,
Acting Commissioner.

Winnipeg, Jan. 7, 1922.

Sir: In response to your request that I would forward you a paper containing some impressions of my inspections of Canadian and United States Roads, I have pleasure in submitting the following:

Dealing first with Canadian roads, the foremost impression was as to the magnitude of the task of providing hard roads for so huge a country, and the second was the thorough way in which the task is being undertaken, and the third, the high standard of construction you have set yourselves to accomplish. If this standard can be pursued you should in a few years have a system of roads second to none.

The widths to which construction is being carried seemed to me likely to prove inadequate in the near future, but I realize with so lengthy a mileage it is most desirable to get a good surface on as much as is practicable at the earliest possible moments leaving widening to a time when development justifies an even larger expenditure and more adequate funds will possibly be available. I can conceive that good roads will immensely hasten development of your country and expenditures on roads will reap an ample harvest in improved values. No country can be exploited to full advantage until it has good road communications.

I was struck with your fine cities of Montreal, Ottawa and Toronto, and the wisdom displayed in getting main arteries of good width and direction. It is such a contrast to the conditions here, where the slow and unregulated growth of centuries has tended to cramp all our towns. You have had your opportunity, and learned your lesson in good time, so that the congested parts of your cities are confined to a very small area.

I found the same general conditions throughout my tour through the eastern part of the United States. Speaking quite generally your problems impressed me as being very similar and your road practice proceeds on almost identical lines. One problem I think you both have to solve is that of diagonal communications. Your layout, being rectangular as a guiding principle seems to me to need diagonals. Admittedly it cuts up land awkwardly, but the advantages in the way of communication I think outweighs other considerations.

Your concrete roads impressed me as affording good service in your present stage of development, and with proper maintenance, should give a good life. Your traffic being mainly rubber tired and in comparatively light units affords them a much better chance than in this country. Here our traffic units are in every class much heavier, comprise a large proportion of steel tires even on heavy steam vehicles, and we have as many vehicles with a registered unladen weight exceeding 2 tons as we have in the category of under 2 tons.

The asphalt roads of the cities I thought were extremely good and less wavy than ours, due partly I think to the lighter units of traffic, but also to the greater experience your engineers have had in the use of this material, which has only been developed here on a considerable scale in quite recent years, largely no doubt owing to heavy freight charges on bitumen.

Both Canadian and American engineers have advantages over us in the superiority of their technical and scientific training supplied by your universities. We are extremely backward in that respect, inasmuch as few of our universities have an engineering side, and none has yet a chair of highway engineers. I have returned to the old country with a very high opinion of the equipment of your engineers for the beneficent work they have to perform in the development of your huge country, a great admiration for the way in which they are performing that function, and with grateful remembrance of the kindly hospitality and assistance extended to me by every engineer it was my good fortune to meet on my tour.

Yours faithfully,

ALFRED DRYLAND, M. Inst., C.E.,
County Engineer of Middlesex.
Kingston-on-Thames, Dec. 18, 1921.

Prof. C. R. Young, assistant professor of structural engineering, University of Toronto, gave an illustrated lecture to members of the Hamilton branch of the Engineering Institute of Canada on the Detroit River bridge, on Jan. 13. He is a member of the board of engineers appointed to supervise the construction of the bridge. Mr. Young gave an interesting talk on the great feat of erecting the big bridge, and with slides showed the work from start to finish. The address was one of the most educational and interesting heard by the members. The work of construction will be supervised by an international board of engineers. Canada is represented by C. N. Monsarrat and C. R. Young, who are well known authorities on bridge construction in the Dominion.

At a luncheon of the Quebec Branch of the Engineering Institute of Canada, held at the Chateau Frontenac, Quebec, on January 9, O. H. Cote, Industrial Commissioner for the Board of Trade, gave an address on "The Ship-building Industry at Quebec in the last century." Mr. Cote said that construction of wooden ships was for a number of years the principal industry in Quebec but now it exists no longer.

LIFE OF WIRE BRIDGE CABLES

Satisfying assurance of the permanence of the three great suspension bridges across the East river at New York has been received recently as a result of a careful examination of those portions of these structures most frequently criticised, namely, the cables. Brought about by the necessity of removing the fabric wrapping of the Williamsburg bridge cables and replacing it by a wire wrapping of the same character as used for the Brooklyn and Manhattan bridges, a careful investigation of the condition of the wires under the wrapping of the cables for this bridge as well as for the other two was made by the Department of Plant and Structures of New York City. As interested parties, representatives of the engineering staff of the Philadelphia-Camden bridge made an inspection of the condition of the cables of the three bridges at the same time, and as a result of the conditions found, have indicated their confidence in the type of structure proposed at Philadelphia.

The indication thus obtained of the long life of wire bridge cables properly protected is merely one of many that have been available to the engineering profession for a long time. The 1010-ft. wire cable suspension bridge built across the Ohio river at Wheeling, West Virginia, in 1846 by Charles Ellet and later reconstructed by John A. Roebling, contains, for the most part the original cable material. After a use of 76 years this material is said to be in perfectly good condition. The Cincinnati and Covington bridge, constructed originally with two iron wire cables, and opened for traffic in 1867, still contains these original cables in excellent condition. When the Roebling railway suspension bridge was built across the Niagara river in 1855, use was made of the cable wire that had formed a part of the original Ellet structure built in 1848. Except for the necessity of cutting out a few dozen wires which

had been badly exposed, the cables so constructed continued to do service till 1897 when the bridge was replaced by the present railway arch. The excellent resistance of cable wire to corrosion was also evidenced when the present Lewiston-Queenston suspension bridge was built in 1899. On removing the old cables of the former structure, which had been built in 1851, they were found to be in an excellent state of preservation. In the new structure, cable wire which had been used in the upper suspension bridge at Niagara Falls, as reconstructed in 1889, was used.

In all the suspension structures built in America prior to about 1880 a clean, bright wire was used, usually dipped twice in boiled linseed oil, passed through an oiled sheepskin, on being unrolled from the reels prior to stringing and then carefully oiled in the strands before the wrapping was applied. With the construction of the Brooklyn bridge, however, from 1876 to 1883, advantage was taken of the newly established art of galvanizing. Both the strand wire and the wrapping wire were treated by the new process with results that have been shown to be excellent. Examination has shown that the Brooklyn bridge cables are as good as they ever were.

Believing that the experience with suspension bridges built prior to 1880 indicated a practically unlimited life for bright wire properly oiled, the engineers of the Williamsburg bridge decided to protect the cables by filling the spaces between the wires with "slushing oil," a hydrocarbon, to which was added 25% of artificial graphite. Instead of covering the entire cable with wrapping wire, as had been done in the Brooklyn bridge, it was covered with four wrappings of canvas, heavily coated with the same bituminous material as filled the interspaces between the wires. To make the whole entirely waterproof and to protect it from the atmosphere, a 1/16-in. steel sheathing was placed outside the fabric. The experience of twenty years has shown, however, that this method of protection is inferior to that adopted by Roebling. The metal sheathing corroded and the canvas wrapping had hardened so that the motion in the neighborhood of the suspenders had caused it to break destroying the waterproof seal at these places. Fear of dangerous corrosion prompted the Department of Plant and Structures to remove the faulty covering and wrap the cables throughout with No. 9 Norway iron galvanized wire. With this protection, there is no doubt the life of the Williamsburg cables will be practically unlimited.

In the construction of the Manhattan bridge, completed in 1909, the Roebling method of cable protection was followed, although at that time there was no indication that the protective covering on the Williamsburg bridge cables would not be satisfactory. The farsightedness of the engineering staff in charge of bridge work in New York City at that time has been amply demonstrated in the excellent condition now found in the Manhattan cables.

It thus appears, as a result of an experience with wire cables in this country extending over a period of about three-quarters of a century, that even with the methods of protection devised for wire cables forty-five years ago, there should be no doubt whatever so far as the cables are concerned, of the life and serviceability of the wire cable suspension bridge for centuries.

RAILWAY POLICY IN THE MAKING

Now that the leader of an important political party in Canada has demanded the immediate consolidation of the Grand Trunk Railway with the Canadian National System and a substantial reduction in freight rates, the announcement of a definite railway policy by the government may be expected shortly. In the adoption of such a policy great issues are at stake. A decision must be made between the consolidation urged by one group and the Shaughnessy plan advanced by another. It is a question of carrying the public ownership idea to its logical conclusion, or returning

the Grand Trunk to its owners and merging the National System with the C.P.R. That the problem cannot be solved on the broad question of idealistic preference without regard to details is evident from a very slight consideration of the matter. Thus, the possible refusal of the United States to permit a foreign government to own and operate railways within its borders has a bearing on the disposal of the Grand Trunk that might well fix the whole policy of the government in railway matters.

PERSONALS

SENATOR HEWITT W. BOSTOCK, M.A., of Kamloops,

B. C., the new Minister of Public Works, was born in Walton Heath, Surrey, Eng., May 31, 1864, and was educated by private tutors and at Trinity College, Cambridge. In 1888 Mr. Bostock was called to the Bar at Lincoln's Inn but never practiced; went to British Columbia in 1893 and engaged in ranching, fruit growing and other interests. The new Minister was elected to the House of Commons for Yale-Cariboo in 1896 and was appointed to the Senate on June 6, 1904. He is a Fellow of the Royal Agricultural Society. He was President of the Interior Stock Raisers' Association of British Columbia in 1916.

ALBERT ROBERTS has been re-elected chairman of the Water Commission, of St. Thomas, Ont.

GEORGE A. GOODMAN, contractor of Windsor, Ont., has been elected president of the Builders and Contractors Association of Essex County.

J. C. BREITHAUP has been elected chairman of the Kitchener, Ont., Water Commission for the twenty-third consecutive term. He has been chairman ever since the commission was first established.

DAVID O. LEWIS, M.E.I.C., has been elected president of the Association of Professional Engineers of the Province of British Columbia for 1922. Mr. Lewis is also a vice-president of the Engineering Institute of Canada.

W. L. McDOUGALD has been appointed chairman of the Montreal Harbor Commission. He assumed his new duties on Jan. 11. The new chairman has been president of the Ogdensburg Coal and Towing Co. for many years.

GORDON D. CONANT has been elected chairman of the Oshawa Board of Water Commissioners for 1922. The new chairman is an ex-mayor and has also served on the Commission for some time.

PROF. C. R. YOUNG, member of the Advisory Board of Consulting Engineers for the Detroit-Windsor bridge, addressed the Hamilton Branch of the Engineering Institute of Canada, on Jan. 13, on the engineering features of the project.

OBITUARY

LOUIS B. TURPIN, contractor of Winnipeg, Man., died recently in that city at the King Edward Hospital.

THOMAS R. LABELLE, formerly a builder and contractor, died at his home in Toronto on January 9, aged 64 years. The deceased was born near Colborne, Ont. and had been a resident of Toronto for 38 years.

A Weekly Paper for Civil Engineers and Contractors

Construction Industries Conference in Hamilton

Important Report Presented by Labor Committee — National Joint Conference Board Ceases to Function — Basic Principles Adopted — Business Outlook for 1922 Said to be Encouraging — Full Report of Proceedings

THREE outstanding questions formed the chief topics for debate at the fourth annual conference of the Association of Canadian Building and Construction Industries, held last week in the Royal Connaught Hotel, Hamilton, Ont. These questions were:

1. What conditions will prevail throughout the construction industries in Canada during 1922? In other words, Will business be good?

2. Will there be any further reduction in the price of building materials and in the wages paid to labor?

3. Should the construction industries continue to recognize international labor unions, and particularly their paid business agents?

After devoting four days to the study of statistics, the exchange of information and the discussion of basic factors, practically all of the members present agreed that there is every indication and prospect of good business during 1922; not a boom, but good, solid business that will be better than 1921 and will permit most contracting and supply firms to work to 50% greater output than in 1921 and to make a reasonable profit on their turnover.

The questions regarding costs and labor were answered principally by the report of the Labor Committee, which was the most important report presented at the conference, and which consisted of a number of resolutions, as follows:

Report of Labor Committee

"Clause 1 — **BASIC PRINCIPLES** — Resolved that the basic principles herein enunciated should be adopted:

"It is realized to-day by public-spirited employers and workmen that their mutual interests should be considered in a spirit of co-operation. In order to be lasting and beneficial, such co-operation must admit certain fundamental rights of both employers and employed, and be carried out by both in the spirit of fair play.

"Co-operative efforts have been attempted in the building and construction industry of Canada, and, in order that these efforts may be such as are likely to lead to satisfactory results, it is felt that certain principles should be accepted by both employers and employees. The following principles are therefore considered to be of basic importance in these efforts to co-operation in the building and construction industry.

"1—No business can last unless there be a substantial accumulation of reserves in order to provide for expansion, periods of depression, and unfortunate experiences involving loss.

"On the other hand employees are justly entitled to expect a remuneration for their services which is more than sufficient to provide for a mere existence and which will enable them to accumulate a surplus to meet contingencies always provided that efficient services have been rendered.

"2 — In localities where any particular labor organization or organizations are in the ascendancy it is wise and expedient for employers and the employees representing such organization or organizations, to enter into agreements, the objects of which will be to stabilize the industry.

But it must be recognized that every individual should have the unrestricted right to work where and with whom he chooses, irrespective of his affiliations with labor organizations.

"Labor organizations who effect agreements with employers should not endeavor to make use of this relationship to the disadvantage of such employers, in order to wrest advantages from employers who do not make such agreements with labor organizations.

"The combined efforts of both parties should be exerted to increase and stabilize the earning power of both employers and employees.

"4 — There should be no discrimination against either employer or employee in a locality where no trouble exists, because of the collective action of his organization in another locality.

"5 — The best efforts of both employers and employees should be directed to the elimination of jurisdiction disputes.

"6 — The general principles of arbitration should be the basis of settling all disputes. Each party should agree to submit disputes to arbitration and refrain from making use of lock-out or strike until the lapse of a specified period after the recommendation of the Board of Arbitration has been made.

"7 — Special encouragement should be given to Apprenticeship.

"The foregoing principles are those that may be held to apply to existing conditions and any change in these conditions that the future may bring forth may warrant their modification or amendment.

"Clause 2 — **BUSINESS AGENTS** — Resolved that in the common interest of the public, the employee and the employer, the policy of this Association shall be to deal directly with the actual employees rather than with Business Agents.

"Clause 3 — **AGREEMENTS** — Resolved that when any agreements are reached with Labor, that these be reduced to writing and that they should only cover wages and hours of work, having in view the stabilizing of rates, and that the Basic Principles enunciated above should find expression in all such agreements.

"Clause 4 — **WAGES AND RESULTS** — Resolved that the very apparent injustice created by the flat-rate system appears to have no complete solution at this time; but it is recommended that all members of this Association should do everything possible to reward the more efficient men by arranging by transfer, to provide constant employment for these men.

"Clause 5 — **INDUSTRIAL COUNCILS** — Resolved that in our industry we have found Joint Industrial Councils tend only to cause dissension rather than cure it, and therefore, such councils should not be continued.

"Clause 6 — **NATIONAL JOINT CONFERENCE BOARD** — Resolved that until such time as the labor members of this Board can agree to the basic principles adopted at this conference, the activities of the Board shall cease.

"Clause 7 — APPRENTICESHIP — Resolved, whereas the present conditions are not favorable for the training of apprentices in the Construction Industry; and whereas it is realized that a serious shortage of trained artisans in certain trades exist; resolved that the Executive be authorized to take up this question with the Federal Department of Labor in an effort to assist the employees by proper legislation and funds to alleviate this condition.

"Resolved further that the National Apprenticeship system as adopted at the May, 1922, Conference at Ottawa be modified where necessary by the preceding and the following recommendations, and particularly as to age limit, and that it should be used as a basis for action.

"Clause 8 — COSTS — As a preamble to this resolution, the following analysis of the present business situation should be given:

"This Conference realizes that the future horizon is clouded and that prophecies in these days are dangerous. It also realizes that the national prosperity cannot remain much longer in the present state of stagnation; further, that as soon as business from a national standpoint commences to move, just so soon will building work start to move.

"In the Construction Industry there exists a scarcity of mechanics, which scarcity will be accentuated when work becomes plentiful, and which condition will undoubtedly be accompanied by the usual drop in efficiency. At the same time it is realized that certain of the basic materials are at present at an artificially low level, and for all the above reasons building costs will tend to increase. On the other hand there still remains many centres where reasonable reductions in wages have not been put into effect and there still remain many major materials the prices of which have not undergone proper deflation, both of which factors will, when righted, tend to decrease prices.

"The Conference is, therefore, of the opinion that although the general trend of costs will be downward, the movement will be very slow and subject to temporary movements in the other direction."

Resolutions Adopted

All the above resolutions were unanimously adopted at general sessions of the conference. Another important resolution that was adopted without opposition was the following, which was presented by a special committee consisting of three general contractors, three-trade contractors and three supply dealers or manufacturers:

"Resolved that a badge or seal be at once prepared for the common use of all members of the Association, and that the seal be copyrighted.

"That a small charge, the amount of which is left with the Executive, be made for the use of this seal and the necessary die, and that every application for a seal be passed upon by the Executive of the local branch or affiliated body, where such exists, in the applicant's locality, and further that both such Executives must endorse the application before granted.

"That this seal be used on the stationery of the grantee.

"That in granting the right to use this seal, the Executive or Executives should scrutinize carefully the integrity, the ability and the responsibility, financial and otherwise, of the applicant, and that power be given the Executives to withdraw the right to use this seal, for cause.

"That it be established as a guiding principle to the members of this Association, as between section and section, that they recognize this seal by working together toward their common advantage."

Standard Practices and Contracts

Another important report was the following, presented by a committee appointed to deal with the standard and cost-plus contract forms that had been recommended at the conference of the association held last year in Winnipeg:

1 — "STANDARD CONTRACT FORMS — Having gone carefully into the correspondence relating to this form of

contract, which is the result of certain recommendations of your committee at the Winnipeg Conference, when the form was adopted, we find nothing in this correspondence that would justify making any alterations; we would therefore recommend that the executive of this Association at an early date consider ways and means of having these forms printed and distributed to the several exchanges, for the use of its members, and they as members of this Association do all in their power to have these forms of Contract adopted for general use by all architects, engineers and public bodies. Also that an adequate unit price per copy be charged to cover the cost of producing same.

"2 — COST-PLUS CONTRACT FORMS — Your committee would recommend that owing to the heavy expense involved in printing this document, that it be placed at the disposal of the members through their exchanges in such form as the executive may decide, as we are of the opinion it would be a guide to the members entering into this form of contract.

"3 — STANDARD PRACTICES — We feel that we cannot enlarge on the very comprehensive report and recommendations brought in by the special committee at our last conference, unless it be to further strongly recommend that as these standard practices demand to a large extent, as to their adoption and enforcement (if only in spirit) on a spirit of friendliness and good fellowship, that the social side of all local associations and exchange work be given more attention; and as far as possible some form of entertainment should be introduced at least once a month, so as to foster and encourage this friendship and good fellowship to the fullest extent.

New Officers Elected

The report of the nominating committee was received without opposition, and the secretary was instructed to cast one ballot for the election of the following officers, who will form the executive of the association for the ensuing twelve months:

Past President — J. P. Anglin, of the Anglin-Norcross Co., Montreal.

President — J. B. Carswell, Carswell Construction Co., Toronto.

First vice-president — James Mackie, James Mackie Co., Winnipeg.

Second vice-president — John V. Gray, John V. Gray Construction Co., Toronto.

Honorary treasurer — E. G. M. Cape, E. G. M. Cape Co., Montreal.

Honorary secretary — John Grieve, Dominion Paint Works, Montreal.

Member of Executive elected by General Contractors' Section — J. M. Pigott, Pigott-Healy Construction Co., Hamilton.

Member of Executive elected by Trade Contractors' Section — E. G. Brousseau, Brousseau Bros., Quebec.

Member of Executive elected by Supply Section — M. F. Gibson, Interlocking Tile Co., Toronto.

Western members of Executive — F. T. King, British Columbia; Geo. E. Hughes, Alberta; William Wilson, Saskatchewan; H. T. Hazelton, Manitoba.

Attendance Very Satisfactory

The attendance at the conference was considered very satisfactory, although not so large as the importance of the meeting really justified. The registration included 65 representatives of 51 different general contractors, 29 representatives of 27 trade contracting firms, and 95 representatives of 72 different manufacturing firms or supply dealers. Of the total registration of 189 (exclusive of the press), Hamilton lead with 52; Toronto came a close second with 51; Montreal third, with 8. There were 7 representatives from Saskatchewan, 3 from Manitoba, 11 from Quebec (including Montreal), and 5 from the Maritime Provinces. The others came from various cities and towns in Ontario.

All of the general sessions of the conference were held in the ball-room of the Royal Connaught Hotel. A long

the walls of this room booths were arranged to accommodate exhibits of materials by the members of the Supply Section of the association. Similar booths also lined the hallway leading to the ball-room, and an overflow of exhibits was accommodated in the small room adjacent to the ball-room. Among the exhibits were the Steel Co. of Canada, Pedlar People Ltd., Super-Cement (American) Ltd., Crane Ltd., Trussed Concrete Steel Co., Brantford Roofing Co., A. B. Ormsby Co., Burlington Steel Co., Ontario Gypsum Co., Babcock-Wilcox Boiler Co., Frost Steel & Wire Co., Bishopric Mfg. Co., Canada Paint Co., Concrete Pipe & Products Co., Canadian Surety Co., Dominion Paint Works, Austin Mfg. Co., Otis-Fenson Elevator Co., Bird & Son, Bartonville Concrete Products Co., Interlocking Tile Co., Canadian Metal Window & Sheet Products Co., National Fireproofing Co., Interprovincial Brick Co., Hamilton Sand & Gravel Co. and Toronto Brick Co.

Luncheon, Tuesday, January 17

The conference opened on Tuesday morning, January 17, with registration and inspection of exhibits. At 1 o'clock there was a luncheon, at which J. P. Anglin, president of the Association, presided. Mayor Copley, of Hamilton, welcomed the visitors. Among the construction problems in Hamilton, he said, are those relating to sewage disposal, sewers, water works and roads for the districts that are being built up, and which will in the future be built up, in the western section of the city.

Lt.-Col. B. O. Hooper, of the Bank of Hamilton, welcomed the delegates in his capacity as vice-president of the Chamber of Commerce. During the past 18 months, said Col. Hooper, he had built 20 houses in Hamilton and had made a profit on the sale of every one of them. There is money to be made in building at present prices, he declared. The country is sane, and is developing on sound lines, so there is no cause for pessimism. Financially, compared with other nations Canada is in splendid condition.

J. F. Mercer, president of the Hamilton branch of the association, called attention to the increase in building permits in Hamilton, the 10% reduction in wages in July, 1921. He expected no labor trouble this year.

Tuesday Afternoon, January 17

J. P. Anglin presided at the first general session of the conference on Tuesday afternoon. J. Clark Reilly, secretary of the association presented his annual report.

The report of the treasurer was received, showing a balance on hand and in the bank of only \$21.60.

The president appointed the following nominating committee: A. A. McDonald (Halifax), W. J. Crawford (St. John), E. S. Mattice (Montreal), F. A. Magee (Hamilton), Jas. Mackie (Winnipeg) and Geo. H. Whitlock (Moose Jaw).

R. J. Fuller (Toronto) suggested the appointment of a small committee to deal with freight rates as affecting the construction industries. Building materials of the heavier type are subject to high rates, said Mr. Fuller, while certain items such as contractor's plant are charged at entirely unreasonable rates. Mr. Fuller's suggestion was referred to the resolutions committee, with the result that a freight rates committee was later appointed under the chairmanship of F. B. McFarren (Toronto).

J. P. Anglin delivered the annual presidential address. He would not prophesy what the immediate future holds in store for the construction industries, although he was absolutely certain of the ultimate future of Canada. The next quarter century will be Canada's, he declared, but the trouble at present is the world condition rather than any national or local situation. He called attention to the shortage of building mechanics, particularly bricklayers. The speed with which construction work can proceed to-day, he said, is limited by the contractor's capacity to lay brick, and to meet this situation many engineers and contractors are endeavoring in various ways to eliminate brickwork.

Mr. Anglin urged that attention be given to the problem of continuity of employment for building mechanics, and said that it is remarkable that the general public should

turn to the building industry to solve the whole employment situation. Men from factories such as stove and steel works cannot often be used to advantage in construction work, he declared and each industry will have to solve its own employment problems.

The construction industries are gradually being worked into a position where they are dealing entirely with labor unions, said Mr. Anglin, rather than with individual employees or groups of employees. Contractors may soon be called upon to discuss international unions more seriously than ever before, and the subject should be treated very carefully, with justice to all concerned, including the public. And nothing should be done by either employers or employees to discredit the industry in the eyes of the public.

Costs of building materials, said Mr. Anglin, is another subject that the conference should handle without gloves. Buildings are required all over Canada, but owners hesitate to build because they think that costs may be reduced still further. The manufacturers point out that freight, fuel and labor govern costs of most commodities, and that until these three items are reduced, prices of many commodities can go down no lower. Whether this be correct or not, said Mr. Anglin, the aim of every manufacturer connected with the construction industry this year should be to see how much he can contribute to the industry and not how much he can withhold from it.

Contractors should not be secretive in their dealings with each other, he declared. They should not imagine that they have something that other firms have not; in most cases this is not true, and all firms would be further ahead if they would freely exchange information regarding their methods.

James Mackie, of Winnipeg, agreed that a more definite stand be taken against paid labor leaders, or business agents. In the plumbing and heating trade in Winnipeg, the experience had been that the men were not unreasonable when facts were properly presented to them, provided that the men could be reached directly and the path not blocked by business agents whose desire was to safeguard their own jobs rather than to safeguard public interests.

J. E. Carswell, of Toronto, vice-president of the association, reviewed the conference that had been held in May, 1921, at Ottawa under the auspices of the Department of Labor. At that conference a special committee had investigated the question. Are buildings not required or are they delayed owing to high costs? It was found that the accumulated demand for buildings and public works in Canada was at that time probably \$780,000,000. When times become normal, said Mr. Carswell, there will undoubtedly be a great shortage of building mechanics. There would not be half enough bricklayers if times were normal at present, and some scheme for dual training should be perfected, he thought for example, a boilermaker could be taught bricklaying and a bricklayer could be shown how to make boilers.

The May conference, continued Mr. Carswell, had been opposed to unemployment insurance except as a last resort. Joint industrial councils had been approved as beneficial to the construction industries. An analysis of building costs had been made and showed that 80% of the total cost is labor. Other subjects that had been covered in the May conference were efficiency and production, wages and the cost of living, and conciliation and arbitration.

The work of the National Joint Conference Board practically stopped a few days ago, said Mr. Carswell, owing to a failure to agree upon basic principles. The representatives of the employers had frequently requested a statement of the principles upon which international labor unions are based, but had failed to elicit a reply. In an effort to get something definite, the employers had outlined seven suggested principles to govern relations between employers and employees in the construction industries in Canada. These were practically the same as the seven principles included in Clause 1 of the aforementioned Labor Committee's report. After consideration, the labor members of the National Joint Conference Board had countered with the following:

"Agreed to preamble and Principle No. 1. ..

"Wish to substitute the following for Principle No. 2:

"For the successful operation of the building industry in all localities, it is fully recognized as being both wise and expedient, and in the best interests of both employers and employees, that mutual agreements be made governing wages, hours of labor and working conditions.

"Wish to substitute the following for Principle No. 3:

"All agreements entered into between employers and employees should be observed to the fullest extent, both in spirit and letter, and where such agreements exist, all work should be carried on with a view of increasing efficiency, stabilizing the industry and removing all sources of friction.

"Disagree entirely with Principle No. 4.

"Agree to Principle No. 5.

"Wish to substitute the following for principle No. 6:

"The general principles of collective bargaining and direct negotiations between employers and employees, through their respective organizations, shall be the recognized basis of reaching agreements. Should this mode of procedure fail, it is agreed that the whole matter should be submitted to conciliation and arbitration under the Industrial Disputes Act, or to such mutual arbitration as agreed upon by both parties to the disputes, and no strike or lock-out shall take place during the period of such action.

"Agreed to No. 7 and conclusion."

J. M. Pigott declared that in dealing with business agents the contractors are getting away from their men rather than closer to them. If the employers make a point to win an argument, it does not get down to the men and has no effect on the situation.

Tuesday Evening, January 17

Separate meetings of the general contractors section, the trade contractors' section and the supply dealers' section were held on Tuesday evening.

Wednesday Morning, January 18

John Grieve, chairman of the supply dealers' section, presided at the general session on Wednesday morning. Mr. Grieve read the list of exhibitors and requested the representatives of each firm to stand as their names were called.

Mr. Grieve then introduced Howard A. McGill, commodity statistician for the Babson Co., Wellesley Hills, Mass., who spoke on the outlook for 1922.

Mr. McGill said that among the favorable factors to be taken into consideration in any attempt to prophesy the future, are the strong financial conditions of the United States and Canada compared with other countries, and the fact that nationalization of advertising and standardization of merchandising are here to stay. Mr. Babson is a decided "bull" on Canada, said Mr. McGill, and believes that in the next 20 or 25 years it will have a more rapid growth than the United States or any other country, but that this is the "long swing" and will not materially affect the immediate situation.

To show present conditions, Mr. McGill stated that in the United States in 1913 the steel mills had 35,000,000 tons capacity, with 31,000,000 tons production. In 1920 the production was 40,000,000 tons. In 1921, the capacity was 55,000,000 tons annually, but the production was only 20,000,000 tons. Similarly the capacity of the cement mills in 1921 was 140,000,000 barrels annually, but they were producing only 100,000,000 barrels. It would be some time before the domestic and export demands would absorb the total productive capacity of all industries in either the United States or Canada.

The number of failures in 1921 was the largest in history, said Mr. McGill; scores of firms are being supported by the banks at present, and mergers and further failures will result in 1922, although the worst is over in this respect. The situation regarding failures can be appreciated, he said, when one realizes that during the war there were five times as many new incorporations each year as there were on the average during the ten years prior to the war.

All unemployment will not be absorbed during 1922, declared Mr. McGill. The correction of employment con-

ditions will be gradually effected by natural laws and tendencies. Wages are still inflated; the cost of living in the United States is still 67% above that of 1913, but it is expected that many of the necessities of life will be reduced in price this year; history shows that wages always trail behind the cost of living, but are inevitably adjusted.

Transportation, taxation and the tariff are matters that need readjustment, said Mr. McGill, and international relations must be improved before export trade can be resumed. In this connection it must be remembered, he said, that Europe owes the United States three or four billion dollars besides the eleven billion dollars of war debt.

There will be no radical recovery of industrial activity in 1922, thought Mr. McGill; the tendency is upward, but it will be gradual. The recovery since 1921 has been very moderate and probably a seasonal rather than a fundamental movement.

The situation is still very unbalanced, declared Mr. McGill, especially in regard to prices. Commodities are grouped into three classes at present. In one class the price is still abnormally high; in another class the price ranges from 10 to 25% above that of 1913 and is probably as low as can be reached; in the third class, the price has sunk lower than the 1913 level and is too low and will probably stiffen in the future.

As examples of the first class Mr. McGill quoted brick at 100% over 1913 prices (this quotation and all others in this and the next two paragraphs being in terms of United States prices), gingham 123%, lime 150%, petroleum 142%, silk 103%, and some chemicals (such as quinine, sulphate, etc.) 200% over 1913 prices.

As examples of the second class he quoted wool at 15% over 1913 prices, wheat 10%, quicksilver 21%, flour 19%, brass 8% and linseed oil 127% over 1913 prices.

As examples of the third class Mr. McGill quoted some non-ferrous metals such as copper, aluminum, lead and zinc at 20% under 1913 prices, corn 15%, oats 8%, rubber 82% and hogs 5% under 1913 prices.

The comparisons made in the above three paragraphs were based on wholesale prices, New York market, latest available quotations.

There cannot be a normal exchange of commodities under these conditions, asserted Mr. McGill, and it is most likely that the trend of commodity prices will be downward for the next 10 or 15 years, although in 1922 some will go up while others go down and the average may be about the same; in fact prices of some building materials may stiffen during the next two or three months, he said, but it will be merely a seasonal recovery. The stock market generally anticipates the commodity market by about six months, and it had forecast a recovery in prices in some lines.

The equipment industries, said Mr. McGill, are in a comparatively unfavorable position, and success in this line will depend on individual effort. In 1921 industries in this line worked only 40% of capacity; in 1922 it is expected that they will work to 60% capacity, or an increase of 50% in business, nevertheless there will be no radical period of prosperity.

Babson's sent out 700 letters to prominent contractors regarding construction costs, said Mr. McGill, and from the replies it was estimated that the cost of industrial construction today is 68% above the 1913 level, but the cost of residential construction is 100% over that of 1913. Building materials will no doubt reach a lower level, said Mr. McGill, but the process may be spread over a long period and two factors would tend to hold up prices for some time to come: (1) The need of residential construction all over the continent, and the fact that the worst of the industrial situation has been passed and the outlook is more encouraging; and (2) that there is not a burdensome supply of materials in sight for 1922.

There can be no radical building boom until material prices do get down to a lower level, declared Mr. McGill, and as they will not likely get down this year residential construction in 1922 may be limited, although better than 1921. The farmers will be very conservative in 1922, he said, and much of the building work will be in industrial

centres, hospitals, schools, public utility plants and public works.

Wednesday Afternoon, January 18

At the luncheon on Wednesday an address was delivered by Grove Smith, Dominion Fire Commissioner. When the general session was resumed at 2:30 p.m., W. H. Hall spoke on "Surety Bonds." He was followed by A. R. Whittemore, who reviewed the building activities in Canada during the past few years and agreed with the Babson statistician regarding trend of costs and the business outlook.

F. B. McFarren, chairman of the freight rates committee, read a paper on freight rates in the brick trade. The Board of Railway Commissioners, said Mr. McFarren, invariably follows the lead of United States authorities, and when the latter decided that brick is not an essential commodity and added 40% to the rates for its transportation, the Board at Ottawa had promptly followed suit. He reviewed the arguments that had been used in attempting to persuade the Commissioners to grant a reasonable rate, and declared that if the rate on brick were reduced the railways would not be burdened with so many idle cars.

Wednesday evening was devoted to committee meetings by some of the delegates, while others formed a party that attended the vaudeville show at the Lyric Theatre. Another large party of delegates witnessed a hockey match at the Hamilton Arena.

Thursday Morning, January 19

Practically the entire morning on Thursday was taken up by the presentation and discussion of a paper on "Construction Costs," by W. A. Connor, chief cost accountant of the Aberthaw Construction Co., Boston, Mass.

The system of cost keeping in vogue in the offices of the Aberthaw company was explained in detail. Slides showing the forms used in this system aided greatly in acquiring a thorough understanding of the methods discussed. In his opening remarks the speaker declared that a successful cost system is one that visualizes the work under construction. Many failures were due to the fact that the contractor had a faulty cost system and a poor knowledge of buying and selling.

Three functions entered into cost accounting that were absolutely essential, viz: Economical handling of work, ability to make a correct estimate, and sufficient data in regard to the nature of the work. Labor costs of any day's work should always be available not later than the next day.

The speaker expressed regret that in many concerns costs are kept secret from the foreman. Foremen should always be posted on the actual cost of operating their departments, and when costs are found to be lower in one department than another, the foreman responsible for the lower costs should be commended.

Of particular interest was the code system used by the Aberthaw company to aid the cost clerks and managers to visualize the structure during its erection.

In conclusion the speaker advised that considerable latitude be given to superintendents in the purchasing of material.

Discussing Mr. Connor's paper, Mr. Fuller, of the John V. Gray Construction Co., Toronto, advocated the use of the man-hour unit as well as the money unit in keeping costs. Mr. Fuller stated that his firm had devised a cost system that is simpler in some respects, and equally satisfactory, as that of the Aberthaw company. Cost work, said Mr. Fuller, should always be the basis of estimating. If the mill work costs \$10,000, some contractors say, "Double it to cover the labor." Then, if they have to lay a hundred thousand brick, they look at the plans and say offhand, "Fifteen dollars a thousand to lay that brick." Judgement and experience are essential in estimating, said Mr. Fuller, but they should be backed by cost data.

In his firm's cost system, said Mr. Fuller, overhead is entered on a separate sheet and not carried as a unit cost on each item. On that separate sheet is listed every im-

portant item of overhead cost that had appeared on any of their cost sheets during a 5-year period. Such items as plant charges, superintendence, clerical staff, workmen's compensation and government tax on material purchases are items that are separate from labor and material, and should not be entered as unit overhead costs.

Every firm, said Mr. Fuller, should have a proper quantity survey form that will indicate what is missed. Too frequently it is the fellow who has missed something who gets the job and then wonders why he failed. Mr. Fuller moved that the conference appoint a committee to devise a proper quantity survey system in order to determine what are the correct units for estimating. A standard system should be prepared and it should be adopted by all contractors, with a view toward having this work done in years to come by one organization on behalf of all contractors, and leading ultimately to the inauguration of the quantity survey system of calling for tenders. At present if ten contractors each spend \$100 in obtaining quantities for preparing a bid, that work has cost the industry the sum of \$1,000, whereas two separate surveys could be made and checked against each other for not more than \$300, and the quantities used by all ten contractors, thus saving \$700 to the industry as a whole.

Mr. Fuller declared that a committee of contractors who had looked into the subject recently had estimated that \$8,000,000 a year could be saved in Canada by the establishment of bureaux such as he suggested. Mr. Fuller's motion was referred to the executive in the form of a recommendation.

Thursday Afternoon, January 19

At the luncheon on Thursday the guests of honor were Senator Robertson, formerly Minister of Labor in the Dominion Government, and Hon. Walter Rollo, Minister of Labor in the Ontario Cabinet. Mr. Rollo was the speaker of the day. He called attention to the need for buildings of all kinds throughout Ontario, and advised the contractors to notify all prospective builders who had obtained quotations from them during the past few years but who had not proceeded with their plans, that costs are now lower and that this would be a good time to revive their plans. A large number of branch banks and other buildings had been contemplated last year in Ontario, said Mr. Rollo, but had been delayed because prices had been too high.

Mr. Rollo predicted the adoption of unemployment insurance. If manufacturers and farmers look to the government to supply them with an adequate amount of labor when they need it, how can the government take care of that labor when the labor is not needed on the farms or in industries? The only way he could see is by unemployment insurance, and if anyone has any better plan, the government should be advised of it, he said.

The cost, up to a few weeks ago, of the municipal relief work had been \$100,000 for the Ontario Government's share, said Mr. Rollo. The Dominion Government pays one-third, the provincial government a third and the municipality a third of the surplus or excess cost of any public works carried on during the winter as relief work to provide employment, the excess cost being the difference between the cost as relief work and the sum that the work would normally cost if carried out by contract in the construction season.

Mr. Rollo also made a plea for safer scaffolds and the enforcement of other provisions of the Building Trades Protection Act, and urged the contractors to "Bring Back Industry by Being Industrious."

After the conclusion of Mr. Rollo's speech, the remainder of the afternoon was devoted to trips of inspection. Fifty visiting delegates inspected the bascule bridge that is being built over the Burlington channel by the Hamilton Bridge Works Co. A special car was chartered on the radial line and the party were the guests of W. B. Champ, general manager of the Hamilton Bridge Works Co., who also entertained them at tea upon their return to the hotel. Sir John Hendrie, president of the company, welcomed the visitors at the bridge, and at the reception at the hotel Mr.

Champ was assisted by Major Ian Hendrie, assistant secretary of the company. Other parties visited the plants of the Ontario Gypsum Co., the National Fire Proofing Co., the Burlington Steel Co. and the Libbey-Owens Co.

Thursday Evening, January 19

The general business session was resumed at 8 p.m., Thursday, with President Anglin in the chair. The conference decided to devote the evening to a discussion of the labor situation. E. G. M. Cape, of Montreal, and J. M. Pigott, of Hamilton, presented an array of statistics and opinions bearing upon costs of labor and materials, and in order to throw light on certain subjects upon which there seemed to be varying opinions, the president called upon J. E. Sweeney, special representative of the Associated Building Employers of Michigan, who was a guest at the conference, to outline the experience of Michigan contractors.

Mr. Sweeney delivered an eloquent and forceful address that was a feature of the conference. He declared that production at the lowest possible price consistent with the welfare of the employee, the employer and the public is what must be sought to put the construction industry upon its feet. Production comes from competition. To be thorough and healthful, competition must have no unequitable restrictions imposed on it. Skill and zeal determine a man's value to an industry and all men skilled and willing must be permitted to compete freely and to lend the benefit of their skill and zeal to the rehabilitation of the industry. "We cannot afford to have either a union condition nor a non-union condition in the building industry," said Mr. Sweeney.

"The Associated Building Employers of Michigan have not been afraid to deal with what we consider the biggest problems first, and we consider the labor problem the biggest in the building business, even to the extent that we hold lack of production by labor responsible for the high freight rates. We have tackled this problem and have the most equitable and peaceful conditions to be found in labor circles in the country today.

"Our American Plan of Employment permits of union conditions prevailing if it is the wish of the employer so to deal with his workmen, but imposes restrictions to protect the public welfare. We have recognized that the question is a triangular affair, having in mind always the welfare of the public as well as the employer and the employee.

"Labor unions are primarily responsible for the unsavory public impression of the building industry in the United States today, and after them the next in the group largely to blame for the troubles of this industry are those groups of employers who have been willing to deal with absolute unionized groups of employees, or rather with their business agents.

"I believe the membership of the American Federation of Labor to be 150,000—that being the active number of business agents—rather than 4,000,000 as the others are all bystanders.

"In conferences, do not forget that there is only a border line between conference and conspiracy. Do not confer with labor so long and so closely that public suspicion be aroused and conspiracy be charged. Let us stand apart from labor. It is a check on our business to be quite apart from labor. The auditor does not sign our cheques and the book-keeper does not audit our books. The public must know what both sides are trying to do in all conferences with labor, and then they will have confidence in the industry."

Upon conclusion of Mr. Sweeney's remarks, the Labor Committee retired to discuss the various points that had been brought up, and Mr. Sweeney was invited to join the committee in an advisory capacity.

Under the direction of Grove Smith, Dominion Fire Commissioner, two reels of moving pictures were then shown to illustrate the advisability of automatic sprinkler protection for factories, schools and institutional buildings. In Canada, said Mr. Smith, the fire loss in 1921 was \$30,-430,000. In the last four years the loss has been \$123,-

000,000, and a sum of \$230,000,000 was paid to the insurance companies. Capitalize the unnecessary cost of the fire menace in Canada and we could readily pay off the national debt. In Great Britain, with a population of fifty million people, the loss in 1921 was only \$36,000,00, or very little more than the loss sustained by nine million Canadians. In Hamilton last year the loss was \$700,000. In Ipswich, England, a city of similar size, the loss was \$18,000.

The largest fire loss is not in districts where shacks predominate, said Mr. Smith, but in what might be called first class industrial buildings. Frequently the contents of a building are far from fireproof even though the building is practically fireproof, and in such cases automatic sprinklers are the only safe protection. They are 99% efficient and have had a splendid record in protecting property. About 500 lives are lost every year in fires in Canada, but not a life has been lost in a sprinklered building.

There were 160 fires last year in public or institutional buildings, yet only two institutional buildings in Canada are sprinklered. There are no less than 80 fires in schools every month, said Mr. Smith. All schools, jails, asylums, hospitals, institutional buildings and factories should be sprinklered. More attention should be paid to fire prevention in building construction, particularly in the case of jails, hospitals and institutions.

Friday Morning, January 20

At the general session on Friday morning Mr. Fuller again urged the appointment of a committee to study estimating and cost-keeping, to collect data on the subject and to prepare a standard system that can be generally adopted.

An amendment to the by-laws, permitting the election of four western members of the executive, was carried. It was decided that a vice-president should be elected each year from one of the four western provinces, and that he and the other four western members should form the Western Executive of the association and that they should meet three or four times each year, if possible, to discuss conditions in the west and to advise the association.

W. A. Wilson presented the aforementioned report on standard contract forms and standard practices.

President Anglin announced that at next year's conference a special projecting room would be supplied for the use of firms wishing to show industrial "movies." Various firms showed moving pictures whenever opportunity offered during the conference, but there was not time nor facilities to show all the films that were available, and it was decided that adequate facilities should be provided next year, as these movies are instructive and interesting, and if encouraged will doubtless form a growing feature of the annual conference. Among the interesting films shown this year were several reels by the Burlington Steel Co. and the Austin Mfg. Co. Other films available were several by Mussels Ltd. and the Steel Co. of Canada.

Mr. Dinsmore extended an invitation to the conference to meet next year in Windsor. Mr. Brousseau extended a similar invitation on behalf of Quebec. As the conference had already been held once in Manitoba and three times in Ontario, but never in Quebec Province, the delegates voted unanimously in favor of Quebec City.

A motion supporting the Ontario Provincial Exchange in their fight against the amendments to the Ontario lien law was referred to the Executive with full power to act.

Norman McLeod (Toronto) presented the aforementioned report of the special committee regarding social meetings and the use of a seal or insignia of the association, and the report was unanimously adopted.

The report of the nominating committee was received and adopted.

Mr. McFarren reported that the freight rates committee would not be able to present a final report until further data had been obtained and he recommended the appointment of a permanent committee. The president appointed Mr. McFarren, and Messrs. Nicholson (Toronto), Robertson (Toronto), McLeod (Toronto), Reid (Windsor), Eaton (Orillia), and Mattice (Montreal).

The following report was presented by J. M. Pigott, chairman of the Finance Committee:

"We have carefully considered the treasurer's report for the year ending Dec. 31, 1921, and have noted from this report that the year was started with a balance on hand of \$1,658.53, and that the year ended with a balance of \$21.60. It is evident, therefore, that if we did not have a large balance on hand at the beginning of the year, that this treasurer's report would have shown a deficit of \$1,600.

"The most important thing, therefore, in connection with this statement is that the receipts will have to be greatly increased if the work that the association is doing is to be carried on efficiently, and all the field that could and should be covered in order that an association of this kind can develop its true and proper value.

"The executive officers should certainly not be required to attend to the actual work through the year at their own expense and it is to be regretted that this should have been found necessary during the past year.

"The method employed in 1920 raising funds, on a commission basis, did not appeal to the members as a whole, perhaps, but, nevertheless, it is evident from a very casual examination that if it had not been for that campaign, it is doubtful if the association could have weathered the year 1922.

"This conference has done much to add to the importance and prestige of the association; it should prove easier now, year by year to spread the organization by increasing the membership.

"In the opinion of this committee, the present conference should be followed immediately by the engagement of a man of the highest qualifications — for a period of three or four months — for the purpose of covering the whole field by interesting the most reputable and responsible concerns in the various cities and towns of Canada, securing their membership applications, and leaving at that center some machinery in the hands of these reputable concerns for extending the list at their discretion.

"As to the conferences themselves, it is in our opinion a most important matter that every local association in Canada should be represented by at least two delegates. In order that the extreme east and west delegates may not be constantly at a disadvantage, in the matter of railway and pullman expenses, this committee strongly recommends that in preparation for the next annual conference, the secretary prepare figures of the cost of bringing two authorized delegates from every local in Canada, and that this expense be averaged up and all pay into the secretary the same amount.

"This might be of still greater benefit if where local associations came closer to the point selected for the conference, their delegations be increased to a point, for instance, where the large majority of the members of the local association should be included.

"In the short time at our disposal we have not been able to lay down any definite recommendation, but would leave the matter with the above suggestion to be worked out in detail later by the secretary, and, if feasible, adopted by the association through the executive before the next conference.

"Another suggestion, as an alternative, is that if the treasury can afford it, the expenses of at least one representative from each organization outside of the province where the conference is held, be paid."

Friday Afternoon, January 20

The guest of honor and speaker at the luncheon on Friday was Secretary Wormith of the Workmen's Compensation Board of Ontario, who reviewed the provisions of the Act in that province and outlined the Board's experiences. The cost of administration of the Act has been only 1½%. The assessment has averaged only \$1.22 per \$100 of payroll. The assessment has been much lower than in many states in the United States. For bricklayers, as an example, the rate in Ontario is \$1.80; in Ohio, \$2.90; in Wisconsin, \$3.78; and in New York, \$8.73.

Mr. Wormith explained the Board's system of rebates to contractors who are required to pay assessments in other

provinces, and the steps taken to prevent employees from recovering damages in more than one province.

In 1920 the Board paid \$7,000,000 in awards in connection with 54,000 accidents, and \$750,000 in medical and hospital and nursing expenses. In 7 years the Board has dealt with 271,000 accidents and has paid \$25,500,000 in awards. The payrolls upon which assessments were levied in 1920 totalled \$450,000,000.

Questioned by various delegates, Mr. Wormith stated that there is no credit rating in the construction industries at present to encourage a record of accident prevention by individual employers, but that there is such a credit system in all other classes of industry, and the spread between the best class and the worst class in any one industry averages about 45% in assessment rate.

James Mackie, vice-president of the association presided at the meeting immediately following the luncheon. J. B. Carswell, the newly elected president, was introduced and spoke briefly of the work before the association during the coming year.

Mr. Mackie presented a handsome cut-glass dish and a ring to E. B. Osborne, secretary of the Hamilton branch of the association, in recognition of the work that Mr. Osborne had done in organizing the convention.

The final report of the Labor Committee, as printed above, was received and unanimously adopted.

Resolutions of thanks were adopted, including one to the Department of Labor in respect to the May conference.

J. P. Anglin said that in organizing the association he had never hoped or intended that it should be developed to sufficient strength to be arbitrary or to impose its will upon the industry regardless of the rights of the public and the employees, but that he hoped that it would continue to exert a great moral influence that would be beneficial.

James Mackie, in adjourning the conference, stated that the association would never tackle its problems in the spirit of looking for trouble, and that at all times an equitable solution would be sought for difficulties, and that the public interest will be paramount.

NEW RECORD OUTPUT OF CANADIAN STEEL

PRODUCTION of steel ingots and castings in Canada during November, according to the Dominion Bureau of Statistics, showed a decided improvement, the output rising from a high record of 72,204 long tons in October to a total of 75,039 long tons. Of the November output, 73,806 tons were made by the producers for their own use, mostly in the manufacture of steel rails. A small amount was produced for direct sale, the total under this item being 1,233 long tons, practically all of which was in the form of steel castings.

The favorable turn in the steel making industry noted in October thus continued throughout November, although the principal activities reported were in the manufacture of steel ingots for further use in manufacturing processes. While, therefore, a considerable increase was noted in the output, the field of production remained somewhat limited. It has been nevertheless a matter of some satisfaction that there has been considerable improvement in at least one section of the steel trade.

The production of pig iron during November was fairly well maintained, the total output of basic iron amounting to 41,232 tons as compared with 42,356 tons in the preceding month. With the exception of some 300 tons, the whole output was produced by makers for their own further use. Foundry iron fell off slightly from 7,217 tons in October to 6,384 tons in November, practically all of which was produced for sale. No malleable iron has been made in Canada since August and no electric castings have been made since September. The quantity of the last-named commodity produced, however, is always small and is entirely the product of electric furnaces.

McKAY & McKAY, of Hamilton, Ont., have been again appointed engineers for the town of Burlington for the year 1922.

A MAINTENANCE DEPARTMENT, ITS FINANCING, ORGANIZATION AND OPERATION

Describes the Functions of a Highway Maintenance Division and Outlines Complete System of Organization and Operation. Says Cities are Judged by Condition of Roads and Streets

By W. A. Van Duzer

Assistant Maintenance Engineer, State Highway Department, Pennsylvania

IT IS incumbent upon any administration to construct durable highways and provide for their future maintenance, as the condition of such highways is at all times an indication of the progressiveness of such municipality or state. The future condition of the highway is treated by the people in an abstract sense, while their present condition is of vital and economic interest to them. The old method of hit and miss maintenance is obsolete. Present day practice requires that it must be carried on in a methodical manner and as a continuous operation.

Financing

The most important preliminary step in any private or public undertaking is its proper and logical financing. Funds should be made available each calendar year so as to permit the department to proceed with its studies and authorizations during the winter months.

I believe a highway engineer, knowing his traffic and having a history of the road's behavior in the past and the type of maintenance it received, can prescribe very intelligently at least five months in advance what the road will need the next season. This gives him and his organization plenty of time to perfect their plans, study the proper equipment and, if necessary, receive bids on the requisite materials, thus assuring, to a great extent, the completion of work before the advent of the season of heaviest travel.

The uncertainty as to the time that an appropriation will become available as well as the amount that will be appropriated are the principal reasons that have made it absolutely necessary to provide a fixed revenue to finance our ever-increasing maintenance. It is but natural that a Legislator, desirous of securing a large proportion of the maintenance funds for his county, should consider it his duty to his constituents to insist that these funds should be appropriated in county units, and a small fund provided which could be used at the discretion of the department in taking care of unforeseen contingencies. But traffic conditions, which are ever changing, have in the past few years become the real problem in proper maintenance, and are the disturbing element in specific county appropriations. The construction of a certain unimproved link, or the erection of mills, shops and other property along a highway can increase traffic to such an extent that appropriations made for a road a year or two in advance cannot meet its requirements, and therefore cause consequent deterioration and eventually make reconstruction necessary.

Availability of Funds Essential

To obtain the best results in any business, whether it be state or private, there must be a fairly definite time within which funds become available, in order that the work may be properly planned. Legislators, realizing this fact and being imbued with keen business sense, in many states have written into the statutes a provision that the fees derived from motor vehicle registrations may be applied towards the maintenance of highways on their state system.

In this manner the control and distribution of these funds are left to a great extent in the hands of the department and place it in a position to meet contingencies as they arise, thus assuring proper attention to the heavy travelled through roads. Experience has shown that this is the logical manner of handling this very important part of the problem.

Owing to the small mileage involved, the maintenance of roads not on the state highway system, but constructed with the assistance of the state, or special maintenance on

main trunk lines in boroughs or towns, can be taken care of by direct appropriation. These appropriations, however, should be made in a lump sum for the whole state.

Preparing a Maintenance Budget

The intelligent distribution of these funds must of necessity result in a budget, this budget being prepared from annual estimates furnished the main office by the representatives in the field. For convenience, we have divided these estimates into six general classes: Indirect expense is a charge covering salaries and expenses of the field offices and forces. General repairs, as the term implies, takes into account the different classifications for the proper maintenance of the total mileage of highways, the crowning and dragging of earth roads; placing of drainage other than bridges, and the necessary repairs to improved roads. Resurfacing, which includes the reconstruction of the different types of pavements already laid, either with the same material or with a higher type of construction. Surface treatment, which includes the purchase and application of the bituminous material and the chips or other covering material. Bridge construction, and repairs to tools and equipment, the last of which covers all necessary repairs to the tools and equipment of the maintenance division.

The preliminary estimates are prepared by the field representatives after a careful and thorough study of each route. The roads are gone over foot by foot, distributing each estimate among the several units of work coming under the various classifications. We will not allow any guess or approximation and hold the engineers strictly to actual figures, so that each engineer has a personal pride in seeing that the work is done within his estimate.

These estimates are totaled in the maintenance division under the different classifications and are gone over very carefully. In the event that the estimated amount required for these roads is in excess of the estimated revenues, it is necessary to make reductions. In the estimate for general repairs, the reduction is accomplished by comparing such estimate with the amount of money expended during the preceding three years upon the different roads, always endeavoring to develop work of a permanent character, such as widening, construction of guard rail, and the placing of surface and subsurface drainage at particular locations. The reduction in estimates for resurfacing is made after a personal inspection of each project by a maintenance inspector from the Maintenance Division, who takes into account the importance of the road, the traffic, and the possibility of substituting cheaper repairs. Reduction in surface treatment estimates is made by a personal inspection of the roads and a reference to the chart showing the character of the treatment they received in past years, together with an appraisal of the probable traffic that the road will carry during the coming season. Reduction in the bridge construction estimates is taken from the bridge records kept in the main office. These records are compiled from an actual inspection of each bridge, made by an engineer of the Bridge Division, which gives in detail the physical condition of each structure.

These estimates are then returned to the engineers with notations as to the advisability of the reduction or elimination of certain work and after the corrections have been made are again forwarded to the main office for approval and the issuance of the necessary authorizations.

Cooperation With Construction Division Necessary

In the preparation of the next season's work the closest co-operation exists between the Maintenance and Construction Divisions and whenever traffic requirements become such that our maintenance costs show the present type of construction cannot be held with economy, that particular section is recommended for a higher type of pavement. When our present system of highways was taken over by the state it included 396 miles of toll roads. The majority of these roads had been built of limestone macadam, and, due to a lack of revenue and increased traffic, had deteriorated to such an extent that when we assumed their maintenance it was a real problem to make such temporary repairs as

were necessary to carry them over until such time as funds became available for more permanent work.

In order to get the full benefit of each year's work, we early determined upon a regular maintenance program; that is, a definite program of resurfacing certain roads was planned for several years ahead with the thought of ultimately giving us improved through highways.

Control of Authorizations

Upon receipt of the final estimates, authorizations for the different classes of work are issued from the Maintenance Division. A code number system is used to readily designate the type of work and approximate location. These authorizations are issued in quintuple, one copy going to the several interested divisions or bureaus. This includes a copy to the Auditing Division, from which an account is opened up chargeable to this authorization; one to the Management Division as the co-ordinating division of the department; one to the Purchasing Bureau, in order that purchases can be checked against the authorizations; one to the Maintenance Division, for the purpose of record and control, and one to the district engineer, which is his notification of the specific amount he has been allotted for a particular project.

This authorization is the instrument used to control the funds and in no case can it be exceeded. It denotes the funds which are to be distributed over the entire season and, in the case of general repairs, the entire length of the route in the specified county.

Our field control of funds is vested in an Engineer's authorization, by which he apportions to the superintendent the funds for a certain definite amount of work which is listed on the face of the authorization, excepting in the cases of surface treatment and resurfacing, when the entire amount of the department authorization is issued. The engineer's authorization is issued in triplicate and forwarded to the Maintenance Division for approval. One copy is kept in that division for record and the other two returned to the district engineer, who retains one for his file and forwards the remaining copy to the superintendent as his notification that the work is authorized.

A special single entry ledger is used both in the field and main office to keep a record of expenditures. The purchase order, which is the authority for a vendor to furnish certain material to the Department, is considered as a liability. The main office receives a report each month upon each authorization issued, according to classifications. This, being summarized, gives us the total amount expended each month under each classification on every route in the entire state.

In order that there may be uniformity in all office procedure, a regular system of field office inspection and audit is employed. We can transfer any field representative from one office to another and the same system of book-keeping and filing will be in effect.

Cancellation or Transfer of Authorizations

Occasionally, the funds authorized for a certain project will be in excess of those actually required and by means of a cancellation and transfer report the engineer, with the approval of the maintenance engineer, may transfer funds from one project to any other authorization in his district coming under the same fund. Upon the completion of an authorization and at the end of the year a report is compiled by the superintendent, which itemizes all pay-rolls and purchases. This is in turn checked by the district engineer's office and is forwarded to the auditing division in the main office for check and record. Any unused amount, not specifically transferred to other work, automatically reverts to the general fund.

Tabulating of Costs

In the cost accounting the Hollerith tabulating system is used. Cost records are prepared from progress reports submitted by the field. These reports show the cost of each of the different items coming under the particular classification, and are filed under route number and

by different years. By referring to them we have a record under the jurisdiction of the Highway Department.

This gives you a brief outline of the functions necessary to the proper financing of maintenance work. The financing and organization are really so closely related that, in order to make certain details of the financing as clear as possible, it has been necessary to borrow some of the functions which would ordinarily come under organization, such as the checking and revision of estimates, issuing of authorizations and cancellation and transfer of funds.

Organization

An organization, to operate with as little friction as possible, must be so planned that divisions of authority do not overlap. Its principal success depends upon proper planning. This particularly applies to resurfacing and surface treatment work. The three outstanding features in planning a job are labor, equipment and material. Labor is taken care of by the local representative in the field. The equipment requirements of each engineer are submitted to the central office at the beginning of each season, showing the estimated time that the equipment will be in use upon each project in his district. This includes rollers, trucks, sprinklers, concrete mixers, asphalt plants and dump wagons, together with the available supply of equipment in his district. From this, a working chart is compiled showing the total amount of equipment in use in each district and the surplus which can be transferred to other districts in the state.

The purchase of materials is made by requisition drawn by the superintendent and approved by the district engineer and the central office. If competitive bids have not been previously received the superintendent asks for quotations from at least three producers and, providing the material meets the Department's specifications, a purchase order is drawn upon the vendor submitting the lowest quotation by the Purchasing Bureau.

The regular payment of approximately eight thousand men twice a month for seven or eight months in the year is a problem of some magnitude, for it means that if we are to keep efficient labor we must pay them promptly and correctly. We use a time card with the workman's name and number on it, the workman retaining the card. The number of hours worked is punched by the timekeeper or foreman each day. Our caretakers send a daily report card to the superintendent, showing the number of hours worked and the kind of work performed, these men working alone under the direct supervision of the superintendent. We believe the post card system is an incentive for the caretaker to produce good results.

The foreman keeps a time sheet and at the end of the pay period prepares a progress report showing the time worked by each workman upon the different units of work which is mailed to the superintendent with the time sheets. He checks the progress report and forwards it to the Auditing Division, the time sheets being retained in his office until the receipt of the checks. The checks are delivered personally to each workman by the superintendent, who receives the time card as a receipt for the delivered check. These time cards are then sorted according to route and pay period, and periodically forwarded to the Auditing Division where they are filed as a record of payment made. We think the most important feature of this method of payment is the personal contact with the superintendent. In this manner he becomes better acquainted with his employees and by checking up frequently in going over the road he can readily pick up any attempt to defraud the State.

From time to time pamphlets of instructions are issued to the maintenance employees, but we believe that the best results are obtained by frequent circular orders and the careful preparation of standards for carrying out the different methods of maintenance work.

As is noted above, considerable time is taken in the planning and scheduling of work previous to the actual operation. A schedule of the various types of maintenance showing the tentative dates of beginning and completing

work is submitted by the district engineer to the main office, and a careful followup is employed to assure the completion of all work authorized.

Handling Complaints

One of the most important functions of the Maintenance Division is the handling of complaints. These receive careful personal attention, no matter by whom written or the nature of the complaint involved, and we endeavor in each case to have a representative of the Department call upon the complainant and adjust the matter if it is within his power to do so. We take the position that the section of road in front of any man's house is to him the most important highway in the State and his opinion of the work performed by the department throughout the State is based to a great extent upon the manner in which his special case is handled. A record of these complaints is kept in the main office according to route and county, and, provided further complaints are received from other sources, an inspection and usually a call upon the complainants is made by a representative from the main office.

System of Reports

In order that our records may be complete and aid in centralized control, a series of reports, statements and charts have been developed covering each phase of the work, included among which is a weekly report made by the superintendents showing the roads covered by them during the past week and their condition. The surfacing and surface treatment reports are compiled in the field and forwarded to the main office. They show the amount of each particular type of work completed and from the information furnished a chart is compiled each week.

Snow Removal

Pennsylvania has organized its forces and equipment, for snow removal on approximately 1100 miles of improved main arteries. These roads are kept open for all kinds of traffic throughout the winter. This snow removal work is handled through the co-operation of the various local offices of the United States Weather Bureau. Postcard reports, showing the condition of each road at five o'clock in the evening, are mailed each day simultaneously to the Weather Bureau meteorologists and the main office, the weather bureaus furnishing this information to the newspapers. Prior to the receipt of this postcard we assume that the road is open unless advised by wire to the contrary.

Central Office Inspection

To standardize practices and methods, we have two maintenance inspectors who make periodic inspection of all State Highway Routes, submitting a report of their condition to the main office, together with their recommendations. They are usually accompanied on an inspection trip by the engineer of the district, or his representative, to whom is given instructions and advice on the handling of their maintenance work. These inspection reports show the progress of each job.

The field operations are directly in charge of the district engineer who has three or more counties, with usually three superintendents. Each district engineer has an office and is directly responsible for all construction and maintenance in his district. The superintendent, who also has an office and clerk, devotes his entire time to the details of maintenance work. He selects and makes requisition for the purchase of all materials and supplies, employs all labor and is directly responsible for the economical maintenance and operation of all equipment.

The success of the organization is dependent to a great extent upon the continuous and economical operation of equipment. We have worked out a complete equipment operation control chart. This is followed up closely by the main office and when any equipment is idle without any explanation it is immediately taken up with the superintendent in charge.

The field control of funds, as referred to in the early part of this paper, is entirely in the hands of the district engineer.

Each foreman, caretaker and truck driver must have an appointment card approved by the district engineer which shows his name, by whom he was recommended, amount he is to be paid and date the appointment is to become effective. This is forwarded in triplicate to the Maintenance Division for approval, one copy of which goes to the Pay-roll Bureau of the Auditing Division for its guidance in passing pay rolls and one copy each to the district engineer and superintendent showing that the appointment has been approved. In the case of truck drivers, the superintendent submits a questionnaire with the appointment card. The questionnaire gives details as to the ability of the applicant to operate motor equipment, and is approved by the equipment engineer before the man takes charge of department equipment.

Operation

The actual operation of the maintenance division is as closely interlocked with the organization as the organization is with the financing. It is very hard to differentiate in some cases between the two. We will assume that the organization has been determined upon and the actual operation is to take effect. The Maintenance Division selects the means to be employed in the repair or reconstruction of the roads, the development of standards and the preparation of instructions as to how to apply these standards and methods.

We have spoken several times regarding the necessity of planning and scheduling your work. Periodic inspection is also necessary and a real system of followup is very important if the best results are to be obtained. Of course, the principal problem for the field to solve is to have a thorough understanding of their roads, type and behavior under various conditions.

In the natural physical conditions to be overcome the study of drainage and local materials is most important. Our slogan from the first has been to repair a road with material in harmony with its original type, that is an earth road with earth, a gravel road with gravel, a stone road with stone.

In the resurfacing of the waterbound macadam type, we have always advocated the use of large stone, varying in size from $1\frac{1}{2}$ to $3\frac{1}{2}$ in.; this stone must be thoroughly locked by the roller before the application of the screenings; screenings to be from 0 to $\frac{5}{8}$ in. and well broomed in with push brooms in order to get a uniform coating; no water to be used until after the voids in the stone have been filled with screenings. The use of a tamping upon the grade and also upon the finished road is advocated. A straight edge should be used longitudinally. There should be just sufficient screenings to properly bind the road without leaving a cake on the top.

On newly built macadam roads, we believe the first surface treatment should be a low viscosity tar of about .5 of a gallon applied to each square yard. As much of the success of future applications depends upon the initial treatment, great care must be exercised to see that the road is thoroughly cleaned especially along the edges in order to insure a maximum penetration. The second application may be either a medium viscosity tar or asphalt, applying .25 to .3 of a gallon per square yard as the road requires, using from twenty to twenty-five pounds of quarter inch to inch chips to the square yard. A road thus treated should not require another treatment for at least a year, but we find that we obtain much better results if we treat our roads successively for the first three years, after which we may be able to omit the treatment for several seasons. We have obtained good results by placing a third treatment of hot asphalt, having an asphaltic content of 88 to 95 at 100 penetration, or a consistency (float test) of approximately 150 c.c. at 50 degrees centigrade. Usually from .15 to .25 of a gallon is applied per square yard, which requires from 30 to 40 pounds of covering material.

One very important function of the Maintenance Department is to make the roads as safe as possible for traffic. With this idea in view we have co-operated with the

railroads in the erection of advance warning signs at all grade crossings, which signs are placed 300 feet from crossing.

Standard danger and direction signs are used by the Department. These are constructed of cast iron and the base is placed in concrete. To augment the direction signs, we whitewash telephone poles to a height of six feet from the ground, which not alone directs the traveler to his destination but is of considerable advantage in traveling at night.

Maintenance work does not alone mean the proper patching and maintenance of the surface but also the proper care within the right-of-way lines. With this idea in view, we have insisted that superintendents place all their patching material in long piles outside of the ditch lines, and that all brush should be cut periodically, piled and burned. With this same idea in mind, where bituminous material is used in the patching of roads, we have constructed drum racks. It not only makes a much neater appearance, but saves the caretakers considerable time in drawing out the materials.

A checkerboard marking is used on abutments and wing walls of dangerous undergrade crossings, which shows up to great advantage as does also the center marking which has been adopted for divisional traffic lines on sharp curves.

The organization and operation of the Maintenance Division of any State can be arranged with a little modification, and the addition or subtraction of units, to conform with the above outline. The principle has been found correct. The changes on account of legal difficulties or geographical difference can be readily made. From the head of the Department to the humblest workman, there must be no break in the organization, no conflicting division of authority, no deliberation of Boards before action can be taken. It must work straight to the point, with but one object. Maintenance is as true an investment as construction. The smoothness requisite to good results is only arrived at after careful study of the problem. Paper read before the American Association of State Highway Officials, at Omaha, Neb.

MILEAGE OF GOOD ROADS BUILT IN QUEBEC IN 1921

Report of the Quebec Minister of Highways Shows that the Government Good Roads Policy Has Made Satisfactory Progress During Last Year

IN spite of the hard times the Province of Quebec has not been marking-time in regard to good road building but has rather been steadily forging ahead with that persistency which is characteristic of its population. This fact is fully demonstrated by the figures given out by the Hon. J. L. Perron, Quebec Minister of Highways, in his annual report which has just been tabled at the Legislative Assembly.

As a matter of fact, the results achieved during the last season can favorably stand comparison with those of the previous years, when the financial stringency was less acute and money more plentiful. For instance, a total of 416 miles of good roads have been built in this Province during 1921, compared with 452 miles in 1920, and 451 miles in 1919, as follows:

	1919	1920	1921
Waterbound macadam	93.94	82.70	55.437 mi.
Gravel	341.77	347.51	322.69 mi.
Bituminous macadam	6.87	13.24	12.773 mi.
Concrete	6.75	8.89	12.612 mi.
Asphaltic Concrete	3.07	none	none
Macadam with cold patch	none	none	5.759 mi.

451.40 452.34 416.271

It is also interesting to compare the mileage of roads under construction at the end of these three years, and also that of the roads that have been rebuilt during the same period.

	1919	1920	1921
Roads under construction	92.25	181.70	125.75
Roads rebuilt	5.8	14.16	30.41 mi.

The rebuilding of some of the oldest roads has been made necessary by the enormous increase of traffic and the ever-increasing capacity of motor trucks, especially in the vicinity of the city of Montreal. In most of the cases old waterbound macadam roads are resurfaced with bituminous macadam.

A distance of 120 miles has been added to the provincial highways of the Province of Quebec by the completion of the Beauce Junction-Sherbrooke highway, which establishes a direct connection between Sherbrooke and Quebec. The total mileage of the provincial highways, directly under the control of the Highways Department, is now of \$470.75 miles compared with 350 miles last year.

Considerable work has been done over the following main communication roads, which are likely to be declared provincial highways as soon as they are completed: Levis-St. Lambert, Montreal-Sherbrooke, Caughnawaga-Malone, Richmond-St. Francois due Lac, Laprarie-Lacolle, Levis-Sherbrooke, Beauceville-Sherbrooke, Levis-Rimouski, Hull-Aylmer, Montreal-Mont Laurier, and Montreal-Ottawa, (via Hull). Nearly 100 miles of roads have been built on these various routes and it is expected that at least two or three of them will be completed in the course of next season.

The Montreal-Sherbrooke road is the first on the list. Work has been carried on in no less than ten municipalities, along that road, during the last season and it is anticipated that it will be resumed with utmost activity from early spring. It is also understood that the Sorel-Montreal section of the Levis-St. Lambert road, on the south shore, will be completed by next fall. The same can be said of the first section of the Montreal-Mont Laurier road, which it is expected, will be completed as far as Ste. Agathe by the end of 1922.

The municipalities of the province continue to show a great interest in good roads, and they co-operate with the Government in a very efficient manner. The question of repairing and maintaining earth roads has been taken up with them with great success. The main difficulty at the beginning was to induce them to abolish the old system of individual work on the roads which was obsolete and unsatisfactory. To this end the government placed generous grants at the disposal of municipalities ready to take direct control of their roads and undertake what repairs and upkeep work that the government inspectors should deem to be necessary. The fact that no less than 646 municipalities, out of a total of 1,000, have taken advantage of this offer, fully demonstrate that the people of Quebec are well aware of the importance of good roads.

The Highways Department is looking for a banner year in 1922. With the appointment of a man of initiative and action like the Hon. J. L. Perron, as Minister of Highways, last September, it may be inferred that the good roads policy of the Government will receive all the care and attention it deserves.

Mr. Perron has made it clear to everybody that the good roads policy of the Government will not be discontinued. On the contrary, he is proposing to have the road law amended at the present session of the Legislature to authorize in certain special cases, especially in regard to the question of maintenance of provincial highways. He will also propose that the Government be authorized to borrow twenty millions more for good roads, as the thirty millions already authorized are nearly exhausted. He has also pledged himself to maintain in the best possible condition the 4,000 miles of improved roads. These roads have been built at great cost, during the last ten years, and Mr. Perron considers it a national duty that they should be maintained in first class order. It will be his first consideration, and all necessary repairs, on these 4,000 miles of roads, will be made early next spring. It has been estimated that no less than 42,000 tourist cars entered the Province of Quebec during last season, and it is expected that the 50,000 mark will be passed in 1922.

THE OPERATION OF SEWAGE TREATMENT PLANTS

Efficient Management Essential for Successful Operation of Sewage Treatment Plants. Weekly Report Suggested As a Means of Preventing Neglect and Consequent Breakdown of System

By John H. Dunlap,

Professor of Hydraulic and Sanitary Engineering, University of Iowa.

THE tendency of mankind to do the wrong thing, and to avoid thinking, is demonstrated forcibly in the operation of sewage treatment plants. In fact, the chief failures in operation are usually human failures. Doctor Thresh, Medical Officer of Health for the County of Essex, England, in an address before the Association of Managers of Sewage Disposal Works, once made a statement somewhat as follows:

"I have so repeatedly seen excellent works give bad results on account of inefficient management, and very defective works give fair results on account of the efficiency of the manager, that I have come to regard the manager as being even more important than the works."

In this connection the writer must confess that he has visited scores of sewage treatment plants, at one time or another, and has yet to find a plant which was not laboring under difficulties, usually of insufficient management. In making this statement, it would not be fair to place the blame upon the men who are theoretically in direct charge of operation of these plants. Usually the cause is farther back and may be located only by an analysis of our inefficient American plan of city and town government. The conduct of the business of our cities and towns is, by our American system, placed each biennium, for the most part, in the hands of new and untried men quite unacquainted with the city's business as a whole, and perhaps, failing to understand most disastrously of all, such a complicated machine as a sewage treatment plant. The common mistake made is to conclude that the sewage plant is automatic, and therefore needs little or no attention. Accordingly some individual like the water works superintendent, or the chief of police, or the city clerk, or some one who already has more to do than he can do, is assigned the task of operating the sewage treatment plant. Naturally, under these conditions the plant is neglected. The bacteria are to be depended upon to do their work if given a chance. The human factor, however, generally fails to function properly, with the costly result that the plant fails to perform its duty. Truly Dr. Thresh was right. The manager is of even greater importance than the works.

The Situation Throughout the United States

In order to ascertain how far the human factor involved in the operation of sewage treatment plants was performing its share of the work, a letter was sent to the sanitary engineers of the State Boards of Health of each of our 48 states. The letter requested an outline of the law, or of the rules, followed in the control of the operation of sewage treatment plants.

Forty-one replies to the 48 letters were received. Judging from these 41 replies, apparently only 18 states are now requiring the submission and approval of plans for sewage treatment plants by the State Board of Health. Only five states are requiring monthly reports, namely, West Virginia, Michigan, Kansas, New Jersey and Ohio. Only one is requiring licensed operators, namely, New Jersey.

The impression from reading these letters is that the general situation is very unsatisfactory. For instance, in the third annual report of the Department of Public Health of the State of Illinois for the period from July 1, 1919, to June 30, 1920, the following statement occurs:

"Experience has shown that there is a strong tendency among municipalities to neglect the operation of sewage treatment plants. It is a common, fallacious idea that sewage treatment works require little or no attention, and consequently they are neglected until objectionable conditions prevail because of odors from the plant or because of

stream pollution. Some sewage treatment plants have been so neglected that they have become permanently damaged and can be put back into operating condition only at considerable expense."

The situation in Connecticut is apparently much the same, as the following quotation from a letter from J. Frederick Jackson, Director of the Bureau of Engineering, indicates:

"I am sorry to say that very few of our plants, excepting the old sand filters, are properly operated. We endeavor to regulate them by occasional inspections and advice, but this is not satisfactory."

A Typical Example in Iowa

The writer was recently called in to advise a city council as to what was the matter with its sewage treatment plant. An inspection of the plant was made, which revealed the following facts. The Imhoff tanks were being operated like septic tanks, with a heavy scum on the sedimentation chambers and with the slots filled with sludge. The attendant in charge of the plant stated that he had been ordered by the city council to let this scum accumulate, since the council thought that this was the proper thing for the tanks, that they could not operate properly without the scum. Of course we all know that septic action in the sedimentation chambers of Imhoff tanks should be avoided, since it interferes with the process of sedimentation.

On taking soundings to determine the depths of sludge, it was found that the sludge was solid from the bottom of the beam forming the slots to the bottom of the tanks. Since no perforated pipes had been placed in the bottom of the tanks at the time of construction, it was impossible to apply water under pressure and agitate the sludge. Accordingly it could not be gotten out of the sludge pipes. Due to this fact, the sludge obtained from the tanks was not as well ripened as it ought to be and dried with difficulty on the sludge bed. Furthermore, a good deal of trouble was experienced with foaming from the gas vents. It was found later that the sludge capacity of the sludge digestion compartments was altogether too small for the population now connected to the sewers.

Two of the four sand filter beds were badly pooled notwithstanding the fact that 18 in. of sand had been added two months before to one of the filters, and at the same time 12 in. of sand to the other. The remaining two filters of the plant were flooded with sewage 6 to 8 in. in depth, and the sewage was flowing over one of the underdrain vents at the corner of one of the filters.

The trouble with the filters was that they were greatly overloaded, since their combined capacity was only about 2,200 people, whereas about 6,000 people were using the sewers. Furthermore, the past season has been an unusually wet one, and this particular sewer system admits large amounts of ground water and also some storm water runoff.

It will be observed that the trouble with this plant was again the human factor, in this instance principally the city council of six members, five of whom were new on the job this spring, who even went so far as to give the attendant instructions which were absolutely wrong in regard to the operation of the plant. Of course, the principal recommendations here were that the plant be increased in capacity to care for the present population connected to the sewers, and, furthermore, that a competent sanitary engineer be employed to have general charge of the operation of the plant.

A Suggested Way of Increasing Efficiency of Sewage Plant Operation

The way out from this inefficiency and this waste of investment in sewage treatment plants will consist in three steps, each of which though perhaps difficult to take, is necessary if a suitable return is to be made upon the large investments now required in sewage treatment plants.

In the first place it is believed that the State Board of Health should require the operator of every sewage treatment plant in the state to render a weekly report of daily operation. A form for such a weekly report is sug-

(To be printed on a postal card)
WEEKLY OPERATION REPORT OF THE SEWAGE TREATMENT PLANT

At		for the week ending		Submitted by		Filters		Outlet				
Sewage by-passed.		Tanks		Cameron or Imhoff.)		(Sand, sprinkling into or contact.)		(Name of creek, river, etc.)				
Day.	Hrs.	Counter.	Time.	Depth.	Sludge Re-moved.	Inf.	Settling solids.	Eff.	Condition.	Effluent stability.	Stability.	Hours spent at plant
	1.	2.	3.	4.	5.	6.	7.	8.	9.	10.	11.

S.												
12. Remarks												

WHAT TO RECORD (To be placed on the left half of the front side of the postal card.)

Col. No.

1. Length of time in hours sewage was by-passed. Under remarks state reason.
2. Reading of counter in siphon chamber.
3. Exact time at which reading was taken.
4. Measure of depth of sludge in tanks at several points and record average depth.
5. Cubic feet of sludge run out, computed from dimensions of sludge bed.
6. Find c.c. of settling solids in 1 hour from influent. See directions for tests.
7. Find c.c. of settling solids in 1 hour from effluent. See directions for tests.
8. Condition as to surface mat, pooling, evenness of distribution of sewage, etc.
9. Number of days' retention of blue color. See directions for tests.
10. Collect sample about 100 ft. below outlet and record days' retention of blue color.
11. Record the number of hours spent in work at the plant.
12. Under remarks state any work not included in columns 1-11, such as removal of sludge from sludge bed, etc.

Suggested Form for Weekly Report on Operation of Sewage Treatment Plant

gested herewith. This form can be printed upon one side of an ordinary size postal card, and when filled out at the end of each week, mailed to the sanitary engineer of the State Board of Health. On the address side of the post card should be printed the address of the sanitary engineer of the State Board of Health, and then upon the left half of the front side can be printed certain directions as to what to record in each column.

It is believed that there are many advantages to be secured by requiring a weekly, rather than a monthly report from Iowa plants. For instance, the report card for a week is small enough so that it can be carried in the pocket of the operator, and filled out on the job when the readings and tests are made. Furthermore, the weekly report will aid in securing daily visits to the plant, and prompt knowledge by the sanitary engineer of the State Board of Health of neglect.

While the suggested form does not go much into detail, it does contain sufficient facts so that the sanitary engineer of the State Board of Health should know when plants are being operated properly. The facts called for are easily obtained. For instance, in column 1, the number of hours sewage is bypassed on any given day, and the reason for it, should be given in order that the state sanitary engineer may know just how much use is being made of the plant. The writer recently visited an expensive sewage treatment plant at which the sewage had been bypassed for a year's time, due to complete neglect on the part of the city authorities. A threatened law suit alone was able to get the plant put back again into operation, and then naturally, at considerable expense. The counter contemplated in columns 2 and 3, is one of the simple devices now on the market.

The depth of sludge in the tanks, columns 4 and 5, is an important matter, especially at this season of the year when it must be ascertained whether or not there is enough room in the sludge compartments for the winter's sludge. The tests for settling solids on the influent and effluent, columns 6 and 7, are simple to make. Imhoff conical settling glasses are used. One glass is filled with the sewage

as it enters the tank, and another with sewage as it leaves the tank. At the end of one or two hours the cubic centimeters of settling solids at the bottoms of the glasses may be read directly from the graduations on the glasses. The average removal of settling solids by Imhoff tanks as shown by these settling glasses, is about 95 per cent.

The condition of the filters, column 8, is of course an important part of the report, since on the average two-thirds of the organic matter in sewage is in solution, and therefore, must be oxidized by the action of the filters. The test for stability of the effluent, column 9, is very easily made. A sample of the effluent may be caught in a 4-ounce bottle, to which is added the proper proportion of methylene blue, by using an ordinary pipette. The number of days' retention of blue color, when the sample is kept at room temperature, is then noted. If the sample retains its blue color for four days, no nuisance will be caused by discharging it into an ordinary creek or ditch.

The test for stability of the mixed creek or river water and sewage effluent, column 10, is an important test in case the landowners below the plant should sue the city for damages due to supposed putrescibility of the creek water caused by the addition of sewage. The test is made in a manner similar to that upon the effluent from the filters. Of course full directions for these tests should be made in a small pamphlet to be issued by the State Board of Health.

Naturally column 11, hours spent at the plant, is one of the most important columns of the report. Under remarks, at the bottom of the card should be stated any work done, which is not included in columns 1-11, such as removal of sludge from the sludge bed, etc.

Operation Under Engineer When Necessary

The second step in the process of placing the operation of treatment plants upon a more scientific basis would be the appointment of a competent sanitary engineer in charge of a plant whenever the weekly operation report, or whenever a personal inspection on the part of the State Board of Health, shows that the plant is not being operated properly. It would not be necessary for the sanitary engi-

neer to devote much time to a given plant. By having copies of the weekly reports sent directly to him as well as to the sanitary engineer of the State Board of Health, and by giving the necessary instructions to the local attendant, proper operation of the plant could be obtained at all seasons of the year.

It is interesting to note that this recommendation was made in the Third Annual Report of the Department of Health of the State of Illinois already referred to. On page 64 of this report it is recommended:

"The burden of constant control of sewage treatment plants should not be borne by the state, but rather the municipalities should retain competent engineers to make sufficiently frequent examinations to insure proper operation. The state should, of course, supplement the work of these engineers and employees by periodical inspections of the plants at reasonable intervals, to check their operation and give advice which can often be based upon the experiences at other treatment plants."

General Directions for Operation of Plant Should Be Prepared

The third step in securing better operation of Iowa plants would include the preparation of a set of general directions for the operation of the various parts of sewage treatment plants of all types. This set of directions should contain drawings and photographs of the proper tools to be used in carrying out the directions. A description of the tests necessary, such as those for settling solids and stability, should be carefully explained. Furthermore, the State Board of Health might assist in obtaining the necessary equipment for making the tests by furnishing complete lists, stating where the equipment may be purchased, and its cost.

Conclusion

The fact that much of the investment in Iowa in sewage treatment plants is now a waste of money is to be regretted. Usually the fault is not with the design of the plants, or with the bacteria upon which the transformation of organic matter depends. The reason for this situation is due principally to the human factors involved in the operation of those plants. It is believed that the three steps of requiring weekly reports, operation under the charge of competent sanitary engineers where necessary, and the preparation of a carefully prepared set of directions will do much to remedy the present deplorable state of affairs. Of course all this presupposes that the Iowa State Board of Health will have funds to finance this extension of its work.

The final question, therefore, again involves the human equation: "Will the state pay the price?" We must not allow ourselves to forget that well-known axiom in the science of public health, propounded by the New York State Department of Health:

"Public health is purchasable. Within natural limitations any community can determine its own death rate."

Paper presented at Conference on the operation of Sewage Treatment Plants, held at Iowa State College, Oct. 27, 1921.

RAWPLUG CO. NOW ORGANIZED TO SUPPLY CANADIAN MARKET

RAWPLUGS, a device for enabling an ordinary screw to hold in any material, are now being put on the Canadian market after having met with very successful sale in England and the United States for the past two or three years. The plugs will be manufactured in Montreal by the Rawplug Co. of Canada; an affiliated company, Inventions Ltd., are acting as sole sales agents. H. Driver, formerly connected with the organization of the Rawplug factory in England, has been appointed managing director of Inventions Ltd., with offices at 128 Bleury St., Montreal.

Rawplugs are manufactured tubes of stiffened, longitudinal fibre strands, so cemented that once in position they can never crumble or pulp. Rawplugs are said to be unaffected by weather changes or moisture, and impervious to decay. The plug expands as the screw is inserted, be-

coming an integral part of the brick, concrete, plaster or other material in which it is placed. The screw automatically threads the Rawplug, thus permitting removal and reinserting as often as desired, without stripping threads.

The plug required to hold any screw is relatively very small, and only a small hole is required. The head of the screw entirely covers the hole. Mr. Driver states that millions of Rawplugs are now in use in Europe and the United States for fastening all kinds of devices to stone, slate, marble, glass, metals, plaster, brick, tile, concrete, hard rubber and other materials. They have proven especially valuable to contractors, engineers and others engaged in concrete and brick construction, and to electrical firms for use in all switchboard, conduit and wiring work.

Tests of Rawplugs under working conditions have shown a force as high as 1,250 lb. to be required as a direct pull to withdraw screws fixed with these plugs in stock brick, and 700 lb. for screws inserted in slate.

Discussing Rawplugs, "The Architect," of New York, says: "An excellent invention which will, we believe, meet with universal adoption in the building trades within a very short time."

BUILDING INDUSTRIES ASSOCIATION ELECTS OFFICERS

A RADICAL change in the system of financing its operation was adopted by the Hamilton branch of the Canadian Building and Construction Industries Association at its second annual meeting on Jan. 11. Instead of raising the operating expenses by means of a flat fee, the association was divided into three sections, each of which undertook to raise a fixed amount of the budget presented by the finance committee. The three sections are: The general contractors, the trade contractors and the manufacturers and supply men. Each section will raise the amount agreed upon by a system of assessment. This plan was adopted instead of the recommendation of the finance committee, that a membership drive be held and the initiation fee reduced for a short time.

The election of officers resulted as follows:

J. F. Mercer, president; J. M. Pigott, first vice-president; R. K. Palmer, second vice-president; Thos. Patterson, hon. secretary; Frank A. Magee, hon. treasurer.

Five committees were appointed and the chairmen of these are: Thos. Patterson, membership; Herbert Harper, finance; J. C. Stuart, labor; Guy Long, business relations; E. A. Wark, entertainment.

The trade contractors reported they were willing to handle all jobs initiated by the emergency employment committee of the citizens' relief committee at cost, plus a small percentage for overhead. This department reported that the matter of details of the team to help the unemployed situation would be worked out with George H. Lees, chairman of the citizens' committee.

No action was taken in regard to trade agreements or wages for the coming year, that matter being laid over till after the annual conference of the present association, which takes place in Hamilton next week.

It is reported that the Montreal Public Service Corporation, which is another subsidiary of the Montreal Tramways and Power Co., has applied to the Quebec Legislature for power to extend its operations through a large part of the province tributary to the site of the proposed Carillon development, and also to acquire and carry on the business of other companies using electricity within its territory limits. It is generally stated that a large sum of American money, probably eighteen to twenty million dollars, is being secured for this development, and that American interests have been here recently looking into the proposition. It is pointed out that even if the proposed development goes through, its effect upon tram power earnings is not likely to be felt very soon, as such construction as must be involved in the Carillon development would probably take two years to complete.

INTERNATIONAL JOINT COMMISSION RECOMMENDATIONS

ACCORDING to an announcement from Washington a detailed plan for the construction of the St. Lawrence ship channel and power development has been submitted to Congress together with the recommendations of the International Joint Commission which are as follows:

(1) That the Governments of the United States and Canada enter into an agreement by way of treaty for a scheme of improvement of the St. Lawrence River between Montreal and Lake Ontario.

(2) That the new Welland Ship Canal be embodied in the scheme and treated as a part thereof.

(3) That the proposed works between Montreal and Lake Ontario be based upon the report of the Engineering Board accompanying this report, but before any final decision is reached, the report of the board, together with such comments, criticisms and alternative plans as have been filed with the commission, be referred back to the board, enlarged by other leading members of the engineering profession.

(4) That there shall be an exhaustive investigation of the extent and character of the damage through flowage involved in the plan of development finally adopted.

(5) That, assuming the adoption of the plan of the Engineering Board, or of other plans also involving a readjustment of the international boundary, in order to bring each of the power houses on its own side of the boundary, appropriate steps be taken to transfer them to one country or the other, as the case may be, and the slight acreage of submerged land involved.

(6) That Canada proceed with the works necessary for the completion of the new Welland Ship Canal in accordance with the plans already decided upon by that country.

(7) That such "navigation works" as do not lie wholly within one country or are not capable of economical and efficient construction, maintenance and operation within one country, as complete and independent units, be maintained and operated by a board hereinafter called "The International Board," on which each country shall have equal representation.

(8) That "such navigation works" as lie wholly within one country and are capable of economical and efficient construction, maintenance and operation as complete and independent units, be maintained and operated by the country in which they are located, with the right of inspection by the said International Board, to insure economy and efficiency.

(9) That "power works" be built, installed and operated by and at the expense of the country in which they are located."

(10) That except as set forth in recommendation 11 the cost of all navigation works be apportioned between the two countries on the basis of the benefits each will receive from the new waterway, provided that during the period ending five years after completion of the works—and to be known as the construction period—the ratio fixing the amount chargeable to each country shall be determined upon by certain known factors such as the developed resources and foreign coastwise trade of each country within the territory economically tributary to the proposed waterway, and that that ratio shall be adjusted every five years thereafter and based upon the freight tonnage of each country actually using the waterway during the previous five-year period.

(11) That the cost of navigation works for the combined use of navigation and power over and above the cost of works necessary for navigation alone should be apportioned equally between the two countries.

Summary of Commission's Report

A summary of the report of the International Joint Commission has been issued which says in part "that the members of the commission as a result of their long and careful study of the situation from every possible angle, have reached the conclusion that the proposed deep waterway is practicable both from an engineering and an eco-

nomic standpoint, and that it would result in adding very materially to the prosperity of the two countries. So far as the United States is concerned, they believe that the benefit would be immediate. In the case of Canada, it might take a somewhat longer time to reap the full advantage of such a route.

"As to the engineering features of the improvement, the commission has had the benefit of the expert advice and assistance of a board of engineers created by the two Governments, Canada being represented by W. A. Bowden, chief engineer of the Department of Railways and Canals, and the United States by Col. W. P. Wooten, of the corps of engineers. This board, as a result of over a year's painstaking study and field work, filed with the commission a comprehensive report as to the best means of improving the river for both navigation and waterpower development in the international section of the river, that is, from Lake Ontario down to Cornwall, with the principal power works in the vicinity of the Long Sault Rapids, designed to produce about 1,500,000 horsepower, one-half of which would go to each country. In the purely Canadian section of the river from Cornwall down to Montreal, only a navigation system is provided, the development of power to be undertaken at some future date when the growing markets in Canada make it desirable. Locks and canals with a depth of 25 feet are provided for at the Long Sault, Valleyfield and Lachine. The estimated cost of the entire improvement, both for navigation and water power, is about \$252,000,000.

Problem of Cost

"Probably the most difficult and delicate problem the commission had to settle was how the cost of this international project could be divided between the two countries so as to put the thing on a fair and equitable basis. The commission's solution, as embodied in its report, is that the cost of that portion of the work chargeable to navigation should be divided on the basis of benefits received; that is to say, that each country should pay a proportion of the cost equivalent to the benefit it actually derives from the waterway. Obviously this principle involves the readjustment at periodical intervals, as the traffic develops on one side or the other. Provision is made for a tentative distribution during the construction period, based on the production and foreign trade of the territory economically tributary to the waterway on each side of the boundary. Further, in distributing the cost of the waterway, Canada is credited with her expenditures on the Welland ship canal, which is considered an essential part of the general scheme of improvement.

"These are in substance the recommendations of the International Joint Commission as embodied in its report to the Governments of Canada and the United States. It now rests with these Governments to accept or reject the recommendations as they see fit."

MAY BUILD BRIDGE AT LEASIDE

YORK Township is considering building a bridge from Leaside to Todmorden. County Engineer Frank Barber of Frank Barber & Associates, Toronto, at a meeting of ratepayers held at Todmorden, strongly advocated that the bridge be built. It would form the main part of a great north-eastern highway into the city. Its construction would break down the barriers which had prevented the development of a corner of Toronto's immediate suburbs 16 square miles in extent. The bridge, Mr. Barber declared, would connect Todmorden and the city south with Leaside and North Toronto. At present Todmorden is a stone's throw from Leaside as the crow flies, but 6 miles by road. Mr. Barber estimated the cost of the bridge at \$870,000, including the approaches, and the subway under C.P.R. and C.N.R. tracks. With approaches the bridge would be one mile and 20 feet long. The length of the bridge proper would be 1,400 feet, its height 130 feet, and its width 56 feet.

TORONTO SCHOOL BUILDING PROGRAM

ACCORDING to Business Administrator Pearce, the building program of the Board of Education for the year, which in preliminary estimates calls for the expenditure of \$2,711,700, will include \$695,000 for High Schools—\$450,000 being for the new Jarvis Collegiate, \$150,000 for adding eight rooms to Humberdale, \$95,000 for adding six rooms to Harbord, and \$30,000 for additional property for North Toronto High Schools. The total of nearly three million dollars required also includes \$1,338,000 to provide 92 grade class rooms, and \$522,000 for new sites. Schools already under construction call for \$66,700, and the High School of Commerce will have to be completed at a cost of \$60,000.

The additions to the various schools and additional sites will cost as follows:

To relieve congestion at Balmy Beach, Williamson Road and Kimberley Schools, eight new rooms are required at a cost of \$118,000, site \$30,000; total, 148,000.

Norway and Roden, 8 rooms, \$180,000.

Gledhill 4-room addition, \$65,000.

Morse and Leslie, 8 rooms, \$118,000; site, \$40,000; total, \$158,000.

North Rosedale, 8-room new building, \$118,000.

Bedford Park, site, \$40,000.

McMurrich, 6-room addition, \$95,000.

Carlton and Hughes, 8 rooms, \$118,000; new site, \$25,000; total, \$143,000.

Ryerson, Manning, Niagara, Brant and King Edward, 12 rooms, \$160,000; site, \$90,000; total, \$250,000.

Ogden, McCaul, Landsdowne and Orde, 12 rooms, \$160,000; site, \$50,000; total, \$210,000.

Hester How, 3-room addition, \$45,000; site, \$30,000; total, \$75,000.

Grace, Givens, Alexander Muir, 8 rooms, \$118,000, site, \$90,000; total, \$208,000.

Parkdale, 3-room addition, \$45,000; site, \$7,000; total, \$52,000.

Runnymede, 4-room addition, \$60,000.

New site between Wilkinson and Gledhill, \$40,000.

ASSOCIATED MANUFACTURERS OF WATER PURIFYING EQUIPMENT

AT a meeting of the executive committee of the Associated Manufacturers of Water Purifying Equipment held in Pittsburgh, Pa., at the Wm. Penn Hotel on January 7, 1922, it was decided to hold the annual meeting at the Bellevue-Stratford Hotel, Philadelphia, Pa., on February 7. A full attendance is expected as several matters of importance will be taken up for final determination, one of the most important being the adoption of standard specification requirements for pressure filters for various services, to the end that architects and engineers may have a standard to which all bidders must comply.

In the past there have often been as many different sizes of filters for the same service as there were bidders, which caused confusion to the purchaser as to which might be most suitable to his requirements. This often resulted in the purchase of apparatus entirely inadequate and unsatisfactory, and detrimental to business. This Association has in its membership practically all the builders of water purification apparatus. M. F. Newman, of the W. B. Scaife & Sons Co., is president. G. F. Hodkinson, of the American Water Softener Co., vice-president, and H. G. Tate of the Berronite Company of America, secretary.

CONSTRUCTION OUTLOOK DISCUSSED AT TORONTO BRANCH, E.I.C.

PRONOUNCED activity in the construction industry in the very near future was prophesied by H. W. Pepper, of the MacLean Building Reports, Ltd., in speaking before the Toronto Branch of the Engineering Institute of Canada, on Jan. 19. According to the speaker, the construction industry is the greatest one in this country with the

exception of agriculture. It is altogether the greatest in terms of labor employment. There is a volume of deferred construction, said Mr. Pepper, amounting to one and a quarter billions of dollars. Apparently labor is responsible for a great deal of this slowing up, since the cost of building labor is off from the peak of 1920 only about 10%, while materials are off 50%.

J. M. Oxley, continuing the discussion exhibited a chart showing the variation of wages for common labor, of the "Engineering News-Record" construction cost index and of the cost of living from 1913 to 1921. Labor is now getting in terms of the cost of living, said Mr. Oxley, 50% more than it did in 1913.

Notice of motion that the Branch by-laws be amended to conform to the length of session now adopted and so as to remove certain ambiguities was given by J. M. Oxley. While the formal discussion will be held on Jan. 26, an informal one took place on the notice of motion.

On account of the illness of the chairman, William Storie, vice-chairman, presided.

OTTAWA ENGINEERS ELECT OFFICERS

AT the annual meeting of the Ottawa branch of the Engineering Institute of Canada, held in the Daffodil Tea Rooms on Jan. 12, which was largely attended by local engineers, the following officers were elected for the ensuing year.

Chairman, K. M. Cameron, assistant engineer, Department of Public Works; secretary treasurer, F. C. C. Lynch, superintendent of natural resources, Interior Department; executive committee, O. S. Finnie, administrator of the Northern Territories, Interior Department; A. Ferguson, inspecting engineer, Department of Railways and Canals; A. B. Lamb, Dominion Water Power Department; C. M. Pitts, Pitts Construction Co.; J. L. Rannie, Geodetic survey.

The meeting terminated one of the most successful years in the history of the branch, largely due, it was stated, to the energetic leadership and untiring efforts of the genial retiring chairman, Commander C. P. Edwards, D.S.O. The financial statement showed a substantial credit for the year. It was also stated that 41 new members had been accepted into the branch.

The vote of thanks to the retiring chairman was moved by George Mountain, chief engineer to the railway commission, who eulogized Commander Edwards after a witty fashion, and concluded by making him a "presentation" on behalf of the branch.

The activities of the branch for the coming year were outlined by the new chairman, when returning thanks for his election, and he announced that the "Engineers' Ball" under the distinguished patronage of Their Excellencies the Governor General and Lady Byng of Vimy, would be held at the Chateau Laurier on January 26. Amongst the subjects of lectures and addresses to be given during the ensuing year are "Good Roads," by George Hogarth, chief engineer, provincial department of highways, Toronto; "Standards," by R. J. Durley, secretary, Canadian Engineering Standards Association; "Canadian Forestry Corps in France," by Major R. H. Nelles; and "Concrete," by Col. H. C. Boyden, of Chicago.

In the December 8, 1921, issue of "The Canadian Engineer" an article appeared by Mr. H. L. Seymour, entitled, "A Compilation of Town Planning Legislation, Province of Ontario." Unfortunately this article omitted to state that the author, Mr. Seymour, was indebted for the information it contained to the following gentlemen: Mr. Thos. Adams, Federal Town Planning Adviser, Messrs. J. B. O'Brien and A. E. K. Bunnell of the Civic Guild, Toronto, and Mr. T. D. LeMay, City Surveyor, Toronto.

Over five hundred engineers will assemble in Montreal this week for the annual general meeting of the Engineering Institute of Canada. An interesting program has been arranged and a number of important addresses will be given.

Letters to the Editor

Sir: I beg to draw your attention to a report contained on page 116 of your issue of the 3rd instant, concerning certain activities of the London Branch of the Engineering Institute of Canada, which is most erroneous.

In the first place the matter of petitioning the Ontario Legislature to make the engineering profession a closed one and together with other branch Institutes to present a petition to the Government at an early date praying that legislation to that end be spread on the Ontario Statutes, has never been considered or discussed. The proposed engineering legislation, while protecting qualified engineers, is primarily intended to protect the public interests. The whole intent of the Bill is to place the engineering profession on a similar footing to the profession of law and medicine and it might be pointed out that similar legislation, to that proposed for the Province of Ontario, has already become law in all Provinces of the Dominion excepting in Alberta and Prince Edward Island.

Then in the second paragraph of the report referred to a most absurd statement is made to the effect that, a closed engineering profession means that no one would be allowed to do engineering work unless he was a member of the Engineering Institute of Canada and membership in that body is made contingent upon the applicant for admission holding a degree from a qualified school of science. A mere glance at the proposed Engineering Bill would show that this statement is absurd for the reason that the Engineering Institute of Canada is only one of the several constituent bodies of engineers, surveyors, etc., that would be represented in the proposed body of Professional Engineers; furthermore, membership even in the Engineering Institute of Canada is not contingent upon the applicant holding a degree from a qualified school of science.

As representing the London Branch of the Engineering Institute of Canada I would ask that you publish in your next issue this correction of the report referred to.

Yours truly,

GEO. C. WRIGHT,

Secretary, London Branch Eng. Inst. of Canada.

Sir: In an item headed "Want Engineering Profession Protected" on page 116 of "The Canadian Engineer" of January 3rd, information is furnished your general readers in which the following paragraph appears:

"A closed engineering profession means that no one would be allowed to do engineering work unless he was a member of the Engineering Institute of Canada, and membership in that body is made contingent upon the applicant for admission holding a degree from a qualified school of science."

The information in this paragraph is not only inaccurate and misleading, but may, unless promptly corrected, work an injustice to the engineering profession in Ontario.

As one of the two representatives of the Ontario Provincial Division on the original Advisory Conference Committee, and as one who had to do with the organization of this committee, I am in a position to state most emphatically that there has never, at any stage of the movement for appropriate legislation to define the status of the engineer in Ontario, been any action taken or even attempted, on the part of those in official authority anywhere in the Engineering Institute of Canada to dominate in any manner, shape, or form, any efforts on behalf of the engineering profession in Ontario for legislation. On the contrary, however, the Engineering Institute did, notwithstanding its predominant numerical strength in Ontario, take the initiative in suggesting to other professional engineering bodies, the formation of the Advisory Conference Committee, upon which the Institute had but two members, the same as the

membership for other bodies — one for instance which had but five per cent of the numerical strength of the Institute.

This action was taken by the Provincial Division upon the advice of Council of the Engineering Institute in order that there should be no doubt whatever about the desire of the Institute to work in the closest possible harmony with other professional engineering bodies for the general good of the profession, wherever and whenever such action was possible. It was particularly realized that in so far as the province of Ontario was concerned, all action of the Institute should be taken with full appreciation for the powers and prerogatives of other organizations interested in the advance of the engineering profession.

At no time in the course of the work of this Advisory Conference, in none of their reports, and in no action which the Committee has taken, has there ever been any thought that membership in the Engineering Institute of Canada, or indeed in any professional body except the Ontario Land Surveyors, could prove a prime factor in the question of qualification for membership in any association of engineers which might be set up pursuant to the desired legislation.

As one of the original members of the Advisory Conference Committee perhaps I may be permitted to express a wish that this letter be published, in order that the impression given in your paragraph referred to above in the news item of your last issue be corrected.

Yours very truly,

J. B. CHALLIES.

Ottawa, Jan. 13, 1922.

GREATER WINNIPEG WATER DISTRICT

To Take in Town of Tuxedo — Transcona Authorities Sell Water to C.N.R. Shops

PART of the town of Tuxedo, Man., entered the Greater Winnipeg Water District last summer. Legislation will be introduced at the next session of the Manitoba Legislature to bring the whole town properly within the District, but there will be no engineering or construction work involved in this procedure.

The town of Transcona, Man., which is the municipality which first draws water from the Shoal Lake aqueduct, and which has its own pumping station and reservoir, recently entered into agreement with the Canadian National Railway to have the railways shops at Transcona take its entire water supply from the town. The consumption of the shops will be approximately three hundred gallons per annum. This quantity will undoubtedly be increased at a later date.

Only three of the municipalities at present comprising the Greater Winnipeg Water District are supplied directly from the Shoal Lake aqueduct, these being the city of Winnipeg, whose reservoir is the terminal of the aqueduct; the city of Boniface, whose reservoir is immediately adjacent to the aqueduct; and the town of Transcona, which has a separate connection direct from the aqueduct, built by the District at its own expense.

The municipalities of Fort Garry, Assiniboia, East Kildonan and West Kildonan are supplied from the distribution mains of the city of Winnipeg, and the municipality of St. Vital is supplied from the distribution mains of the city of St. Boniface. This arrangement is merely an extension or continuance of an arrangement which existed between these municipalities before the Greater Winnipeg Water District came into existence.

None of these smaller municipalities operate their own pumping station. They purchase the water from the District and the pressure from either the city of Winnipeg or the city of St. Boniface, both the cities and the District being paid at a fixed rate per thousand gallons of consumption. This arrangement will be continued until such time as the consumption of the smaller municipalities increases sufficiently to warrant the construction of a direct connection to the aqueduct.

LEGISLATION NEEDED IN ONTARIO

MEMBERS of at least seven engineering societies in the Province of Ontario are co-operating in the preparation of a Bill for regulating the practice of engineering, to be introduced in the Ontario Legislature this winter. A similar Bill was introduced last winter, and, as our readers will remember, was heartily supported by "The Canadian Engineer" in a number of editorials which strongly urged the adoption of the Bill and which pointed out the fairness of, and the necessity for, the proposed legislation. "The Canadian Engineer" has had no reason to change its attitude toward this legislation, and believes that the Ontario legislators should adopt it at the earliest possible date; and in fact, that some such measure for the regulation of the profession should have been put upon the statute books of the province years ago.

In our issue of January 3 there appeared a news item from a London, Ont., correspondent, intimating that should the profession be "closed," nobody would be allowed to practice engineering unless he were a member of the Engineering Institute of Canada, and that membership in that body is contingent upon the holding of a degree from a qualified school of science. We regret the publication of this item, which was inserted during the absence of the editor, through illness, because everyone who is familiar with the efforts of engineers in Ontario to secure fair legislation knows that the Engineering Institute is only one of a number of engineering societies that desire such legislation, and that there is no suggestion in the proposed Bill of any requirement for membership in the Institute in order to practice engineering in Ontario. Moreover, all who are familiar with the Engineering Institute of Canada know that there are many members of that Institute who have never attended any school of science, and that any qualified

engineer can be elected to membership in the Institute, regardless of any lack of university degrees.

In almost every paper, news items can be found occasionally which are contrary to the editorial policy of the paper. Also, unfortunately, it is at times difficult to prevent the appearance of a news item that is totally wrong and unfounded. Readers of "The Canadian Engineer" may be assured, however, that it is the aim of this paper to have its news columns as correct as possible, and as much in line with the editorial policy as possible, and where errors are made, we have no hesitation in confessing the mistake and publishing a correction. Two letters, calling our attention to the above-mentioned error, appear in another column of this issue. We heartily concur with the statements of the writers of those letters, and thank them for having called our attention to this unfortunate item, which should not have been allowed to get into type.

FUTURE SOURCES OF ENERGY

SERIOUS stocktaking of the world's supply of energy took place at a meeting of the American Chemical Society last autumn. Scientists and engineers of vision are keenly aware of the fact that the source of energy contained in fossil coal, allowing for the rapidly growing consumption, will not be available for more than about 1500 years. At the same time, the reserves of petroleum are rapidly being depleted. The United States, which consumes 80% of the world's output, has remaining only an ascertained supply of 7,000,000,000 bbl. from which it is drawing at the rate of nearly 400,000,000 bbl. a year on a rapidly rising curve of production. In view of the constant increase in the number of motor vehicles, it is estimated that the gasoline demand for the United States will be 300,000,000 bbl. in 1930. It therefore appears that however useful and valuable the oil supplies of this continent may be, they are at best a short-lived asset. Natural gas is, too, a waning asset. When it is considered that about as much gas is wasted as used, the known supply cannot be counted upon for any great period.

With the prospect of lessening supplies of power for fuel, attention is bound to be focused more and more upon hydro-electric energy. It is fortunate that this country is singularly well supplied with this source of power. Estimates place the total water power possibilities of Canada at nearly 20,000,000 h.p., of which about 12,000,000 are available in the provinces of Ontario and Quebec. The available horse power per capita is over twice as great as in the United States, and is larger than for any other country, except sparsely settled countries such as Iceland and Norway. Of the total available power in Canada, only about one-eighth has actually been developed, so that we have a resource that should enable us to view with less alarm than might otherwise be the case the possibility of dwindling fuel supplies.

Renewed attention has been directed during recent years to the utilization of the power of tides. The most promising project of this character that has been outlined is the proposed tidal power development in the estuary of the Severn River in England. Taking advantage of the 30-ft. tide, it is proposed to build a dam across this body of water, so arranged as to trap the rising tide and lead it through turbines when the tide is falling. A total steady output of about half a million horse power will thus be provided, although an installation of over 1,000,000 h.p. will be necessary to provide the estimated block of power on a continuous basis. In order that energy may be available during the period of rising tide, the excess of power obtained when the turbines are operating is used to pump water into a reservoir in the valley of the river Wye, from which energy is obtained when the plant would otherwise be shut down. This development is calculated to save about three or four million tons of coal per annum and to offer such collateral advantages by way of providing a road and railway viaduct across the estuary and accommodation for shipping in the basin above, that the project is regarded as a promising one financially.

It is natural that in this general inquiry as to possible sources of energy, attention should once again turn to the energy derivable from the wind and the heat of the sun. While small quantities of power may be obtained from the wind, it is too variable and uncertain a source to be considered for any more than purely trifling requirements. Science is turning, however, with more and more interest to the possibility of utilizing solar energy. It will be remembered that John Ericsson nearly forty years ago obtained 1 h.p. with a mirror having an opening of ten square meters. Shuman undertook the construction of a solar engine near Cairo, in Egypt, but was not able to obtain the amount of power derived by Ericsson. However, it is seriously believed that a renewed study of the problem would show it to be feasible to derive useful blocks of energy from solar installations on the great deserts, or wherever long periods of continuous sunshine may be counted upon.

Apart from these definitely known sources of energy, engineers of a speculative turn are disposed to look forward to the ultimate utilization of atomic energy. While such is probably a long distance in the future, it is interesting to reflect on the observation of Sir Ernest Rutherford that "The human race may date its development from the discovery of a method of utilizing atomic energy."

PERSONALS

WILLIAM WALKER has been elected chairman of the Water Commission of Windsor, Ont.

JOHN A. CAMPBELL has been appointed Water Works Engineer for the town of Dresden, Ont.

ARTHUR ST. LAURENT has succeeded the late Eugene D. Lafleur as chief engineer of the Department of Public Works, Ottawa.

WILLIAM KEITH, Reeve of Newmarket, has been re-elected Chairman of the Toronto and York Roads Commission.

A.L.D. C. E. TISDALL, at one time Minister of Public Works in the British Columbia Provincial Legislature, has been elected mayor of Vancouver.

L. G. READ has just been appointed Consulting Engineer for the National Water Main Cleaning Company of New York with head quarters at Bridgeport, Conn.

W. K. SANDERSON has been again elected chairman of the St. Thomas, Ont., Hydro-Electric Power Commission. Mr. Sanderson was first elected chairman in 1914 when hydro was introduced into the city of St. Thomas and has been re-elected every year since.

E. A. LUNDERVILLE, formerly purchasing agent and comptroller of the Canadian Ingersoll-Rand Co., Ltd., Sherbrooke, Que., has been appointed as sales manager of the Bawden Machine Co., Ltd., Toronto. Mr. Lunderville resigned from the Rand Co. in 1917 in order to enter business on his own account. He purchased the plant of the Colonial Machinery Co. at Cowansville, Que., and became president and manager of that firm, but recently sold his plant to local interests and moved to Toronto.

T. KENNARD THOMSON, consulting engineer of New York City, delivered an address before the Peterborough branch of the Engineering Institute of Canada entitled "Some Problems of a Consulting Engineer." In the course of his address Dr. Thomson made reference to the power possibilities of the Niagara and St. Lawrence Rivers and also dealt with caisson work and other interesting engineering problems. Dr. Thomson graduated from University of Toronto in 1886, secured his degree of C.E. in 1892 and his D.Sc. in 1913.

HON. WILLIAM C. KENNEDY, the new Minister of Railways and Canals in the Dominion Government has been in the House of Commons since 1917. He has always been regarded as a forceful speaker and a clever politician. He was one of those chosen by the Prime Minister to accompany him on his recent campaign tour, and following the election. Mr. Kennedy was born on August 27, 1868, in

the city of Ottawa, a son of William Kennedy and his wife, Julia Costello, both Irish. He was educated in Toronto. He now resides in Windsor, Ont., and is a gas and oil operator.

OBITUARIES

MILTON C. JACKSON, for many years a contractor in Nanawee, Ont., and later in Toronto, died in Toronto on January 13, aged 74.

JOHN EDGAR SHOWLER, at one time a prominent builder and contractor of London, Ont., died in Winnipeg on January 13, aged 75.

EUGENE D. LAFLEUR, chief engineer of the Department of Public Works, Ottawa, died on the 14th instant in his sixty-second year. Mr. Lafleur was a graduate of Ecole Polytechnique, Montreal, and also a member of the Engineering Institute of Canada. He was in charge of the surveys of the Georgian Bay Canal in 1904-5, and was appointed to his present position in 1904. He was one of the promoters of the Manitou Oil & Gas Company and reported on the proposed Prince Edward Island tunnel in 1906.

ARTHUR E. B. HILL, B.A. Sc., M.E.I.C., died in Vancouver on Jan. 12, aged 76. The deceased was born at Hillside, N. S., and graduated from McGill University in 1875. He joined the engineering staff of the C.P.R. in 1881, but went west in 1886 to take up the position as engineer and manager of the Coquitlam Waterworks Co. Later he designed and supervised the construction of the waterworks system of New Westminster. He was employed on the final location and construction of the C.P.R. in British Columbia during the early years, when the railroad was being built through the Rockies.

ROBERT W. THOMSON, mining engineer, died at Kamloops, B.C., on the seventh inst. Mr. Thomson graduated from the University of Toronto in 1893 and went directly to South Africa and entered mining work in Johannesburg, later occupying responsible posts in the mining operations of the Rand. He saw service in connection with the restoration of order at the time of the Jameson raid and was obliged to leave the country during the Boer war. After the war he returned and took up the work at the mines where he remained until 1908 when failing health compelled him to return to Canada. In 1910 he resumed practice in Canada and at the time of his demise he was District Mining Engineer for British Columbia.

PUBLICATIONS RECEIVED

DEEP WELL PUMPS—Catalogue B issued by the Chippawa Pump Co., Inc., Chippawa Falls, Wis.; 32 pages and cover, 6% by 9% in., printed in two colors on coated paper; well illustrated.

THE MINISTRY OF HEALTH REQUIREMENTS AS TO SEWAGE PURIFICATION by S. H. Adams, A.M.E.I.C. To those who have to do with the design, construction and operation of sewage disposal works this book, written by one who has had so extensive and unique an experience in this phase of sanitary engineering work will prove of great interest.

The book contains thirty-nine pages and covers the history of sewage disposal, makes important quotations from the reports of the Royal Commission, in addition to many interesting tables and diagrams all of which are calculated to be of specific and practical use to those who are concerned with sewage disposal work. There are tables covering rainfall, pumps, electrical pumping and many others, all of which will be found of great reference value to sanitary engineers generally.

The author who has devoted a life time to the study of such questions as this has in the preparation and publication of this book, made a distinct contribution to the literature of the subject.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

Construction news items, including notes of various tenders called, are published on pages 41 to 50 of this issue. The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported on the above-mentioned pages. The word "Issue" refers to the issue of "The Canadian Engineer" in which there appeared a notice giving some details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Ottawa, Ont., supply of steel pipe, valves and fittings	Jan. 31	Jan. 3
Orillia, Ont., supply of road roller with scarifier	Jan. 31	Jan. 17
Ontario, Province of, work on provincial highway, Township of Ameliasburg ..	Feb. 10	Jan. 17
Victoria, B.C., fabrication and erection of part of the superstructure of Johnson Street bridge	Feb. 13	Jan. 17

BRIDGES, ROADS AND STREETS

Alberta, Province of.—City Engineer George W. Craig, Mayor S. H. Adams, Commissioner A. J. Samis, and Commissioner Angus Smith, of Calgary, made a strong appeal to Hon. Alex. Ross, minister of public works, that the province rebuild the old Bowness road, between the city limits and the Bowness bridge.

Aylmer, Ont.—The council will petition the Provincial Government for further highway improvements on Talbot St., between that town and St. Thomas.

Birch Cliff, Ont.—Scarboro Township Council decided to cut down a hill on Denton Ave. to provide work for the unemployed. A fill may also be made on Pharmacy Ave. Clerk, W. A. Annis, Scarboro.

Bridgeburg, Ont.—W. M. German, M.P., has gone to Ottawa and will take up with the commission that is now running the Canadian National lines and the Grand Trunk, the question of enlarging the International Bridge here.

Britannia Beach, B.C.—The contract for the rebuilding of the bridge which was carried away in the flood last November has been awarded to Hodgson, King and Marble, of Vancouver, at \$10,000.

Calgary, Alta.—L. C. Charlesworth, of the provincial public works department, and George W. Craig, City Engineer of Calgary, will hold a conference with C.P.R. engineers regarding the replacing of the old wooden bridge over the C.P.R. irrigation canal, on the extension of Seventeenth Ave., by a new bridge.

Chatham, Ont.—A special committee of the Kent County Council, consisting of Reeve Cameron, chairman of the county roads committee; Reeve Ward, of Orford; and Road Superintendent Pardoe, will interview Hon. F. C. Biggs, provincial minister of public works, regarding certain road improvement work for Kent County.

Debden, Sask.—The local board of trade is seeking co-operation with the towns of Polwarth, Canwood, Shellbrook and the city of Prince Albert, to urge upon the provincial government that the Prince Albert-Shellbrook highway be continued north to Debden, and then west to join the old Green Lake trail at Shell River. The distance between Shellbrook and Debden is 31 miles, and there are 9 miles between Debden and Shell River post office.

Hamilton, Ont.—The advisability of diverting the Waterdown road to connect with bridge No. 3 at the western

entrance of the provincial highway system to this city, was discussed by the suburban area commission with Hon. F. C. Biggs, minister of public works recently. Estimates for the work were presented, and there is a strong likelihood that this shortcut will be incorporated in the good roads system. The plan is to build a road from a point near the Jewish cemetery to the provincial road. To do this would require, according to estimates, excavations of 6,500 cu. yds., and a fill of 48,000 cu. yds.

London, Ont.—The Suburban Roads Commission is to be reorganized and new work resumed. First plans are to be laid for continuing the pavement of the pipe line road through from the city limits to Springbank Park. Address Ex-Mayor E. S. Little.

London, Ont.—The works committee decided to carry out all paving work this year by day labor and filed the recommendation of the 1921 works committee that tenders be called on all city works or supplies contracts. Tenders will be called, however, on sewer construction, curbs, gutters and sidewalks.

Montreal, Que.—Work on the plans for the widening and enlargement of the subways on Wellington and Ontario Streets will be commenced immediately.

Ontario, Province of.—It is understood that the Department of Public Highways intends to build about four miles of the Kingston-Ottawa highway this year, commencing at the village of Barriefield.

Ontario, Province of.—A diversion of the provincial highway between Belleville and Picton is being urged by various interests in Prince Edward County, and as a result of representations made to the Department of Highways by Hon. Nelson Parliament, member for the riding, engineers will be sent down to go over the ground and report on the proposal.

Ontario, Province of.—Seeking for an extension this year of road work from Burk's Falls to Magnetawan, a deputation of North country men, headed by Dr. J. J. Wilson, Burk's Falls, waited upon Premier Drury and Hon. Beniah Bowman, and received assurance that as much work as is practicable will be gone on with during the winter.

Ontario, Province of.—A deputation from Elgin County waited on Hon. F. C. Biggs, minister of public works, asking that the provincial highway be continued through from London to St. Thomas, the principal object being to get the highway from Talbotville into St. Thomas, a distance of three miles. It is stated that Mr. Biggs gave assurance that this would be gone on with next summer.

Ontario, Province of.—The Department of Public Highways will shortly call for tenders for the construction of a high-level bridge across the Highland Creek Valley at West Hill on the Kingston Road. The highway will be diverted to a point some distance south of where the present roadway winds down the "S" bend from West Hill, and will cross the valley where it narrows to a width of about 700 ft.

Quebec, Province of.—The Government will construct a bridge across the Gatineau river at Gracefield, work to start early next summer. Chief Engineer, Emile Lemondeau.

Quebec, Que.—Hon. J. L. Perron, Minister of Roads, will call for tenders for the completion of the balance of the Montreal-Mont Laurier highway, a distance of seventeen miles between Montreal and St. Agathe. Tenders will also be called for road construction on the St. Lambert-Levis highway. The section to be built is 28½ miles between St. Lambert and Sorel, and construction will be of gravel and macadam. Another highway which will be built next

summer, and for which tenders will be called by the department within two weeks, is the road between St. Hyacinthe and Rougemont. Tenders will also be called in about two weeks for the building of 25 miles of road between Montreal and Sherbrooks.

Seymour Tp., Ont.—The Township Council plans road work and will probably appoint a road superintendent and foreman for same. Clerk, George A. Hay, Campbell-ford.

Toronto, Ont.—Ward Seven ratepayers are agitating for the preservation of Dundas St. as well as Bloor St. as a provincial highway, with a high-level bridge at the Humber River.

Toronto, Ont.—It is understood that the program for this year of the Toronto and York Roads Commission will be one of the largest attempted in the twelve years the commission has been in existence.

Toronto, Ont.—Dr. Hugh A. Stevenson, M.P.P. for London, accompanied by a delegation representing Huron County, waited on Hon. F. C. Biggs, minister of public works, to urge that the road from Brucefield and Egmont to Wroxeter Station, in Huron County, be taken over as a provincial road and converted into a permanent highway.

Unionville, Ont.—At a joint meeting of Markham and Whitchurch Township Councils it was decided to go ahead immediately with the opening of the Markham-Whitchurch townline. Reeve George B. Padget and Deputy-Reeve W. C. Gohn, of Markham, and Reeve Crawford and Councillor George Leary, of Whitchurch, were appointed a committee to look after the work.

Vancouver, B.C.—The City Council authorized the expenditure of \$4,700 on new trails, to be built on Somerset St., between Finlayson and Tolmie Avenues; on Jackson St., between Finlayson and Dolmie Avenues; and on Lotus St., from Harriet Road to its end. City Engineer, F. C. Fellowes.

Walkerville, Ont.—Mayor C. J. Stodgell has advocated the widening of the Sandwich Street bridge over the Grand Trunk Railway.

Waterloo, Ont.—Waterloo County Council plans to pave the roadway running two miles south of Elmira this spring. County Engineer, Herbert Johnston, 103 Frederick St., Kitchener, Ont.

Windsor, Ont.—The City Council passed a by-law providing for the construction of pavement on Pierre Ave. City Engineer, M. E. Brian.

York Tp., Ont.—The Township Council estimates the cost of constructing a subway under the Grand Trunk tracks, asked for by the residents of Hilbury Ave., at \$50,000 or \$60,000.

WATER, SEWAGE AND REFUSE

Brantford, Ont.—Work on the new \$130,000 trunk sewer system is to be started within the next few weeks.

Brantford, Ont.—The Brantford Township Board of Health is in favor of proceeding with the construction of more sewers as a means of preventing pollution of the Grand River.

Brantford, Ont.—Because of the pollution of the Grand River the Brantford Township Board of Health will send a deputation to the Provincial Board of Health in an effort to secure relief. R. W. Henry of Brantford Township is chairman of the Board.

Chatham, Ont.—The Water Commission has decided to submit to the ratepayers at the next civic election, in November, a by-law to provide for an expenditure of approximately \$600,000 for the construction of a new water works system.

Fort Garry, Man.—On February 7 a by-law will be submitted to the ratepayers of St. Vital School District No. 1024 to authorize the borrowing of \$9,000 for water supply, sewer and general improvements of the school. Secretary-Treasurer, H. D. de Moissac.

Galt, Ont.—The City Council intends to construct sanitary sewers and storm drains on Wright Ave., Todd St., and Dayton St., at a total estimated cost of \$23,907.41.

Galt, Ont.—The City Council intends to construct sanitary sewers and storm drains on the following streets: Dundas, Dumfries, Borden, Grandview Ave., Waterside Ave., and Augusta St., at a total estimated cost of \$33,673.76. City Clerk, Joseph McCartney.

Hamilton, Ont.—City engineer E. R. Gray has recommended to the Board of Control that a consulting sanitary engineer be engaged to assist in drawing plans for the rearrangement of the sewage disposal system.

Hamilton, Ont.—The Board of Control is considering the question of extending the sewage disposal system. City engineer E. R. Gray has recommended the consolidation of the Gage Avenue, Wentworth St. and Ferguson Ave. plants and the installation of modern equipment. Mr. Gray said that the system would have to be extended eventually to take care of the needs of West Hamilton, Mountain Top and parts of Barton below the mountain but not in the city at present. Albion Creek was suggested as a suitable location for one of the new plants.

Hamilton, Ont.—In a report to the Board of Control regarding the condition of the present sewage disposal plants, City Engineer E. R. Gray recommended that the existing plants be modernized and that the Gage Ave., Wentworth and Ferguson Avenue plants be consolidated, the combined plant to be located east of Gage Ave., which would require a considerable alteration in the present sewer system. Mr. Gray stated that he was not in a position as yet to recommend any special system for the handling of the city's sewage problems.

Kitchener, Ont.—A water works line will be constructed from Queen St. to Riverside Terrace.

London, Ont.—The Provincial Government has put through orders approving \$100,000 worth of sewer construction work to be undertaken here at once. City Engineer, H. A. Brazier.

Midland, Ont.—Mayor W. H. Duncan has advocated the construction of sewers in the east and south-east sections of the town, plans for which have been prepared.

Mimico, Ont.—Mayor Doughty has issued orders for the construction of water mains on Dean St.

Mimico, Ont.—The Town Council decided to construct a sewer on Cavell Ave., from Victoria to Albert St., and on Melrose Ave., from Wesley to Grand Ave. Clerk, B. A. Telfer.

Montreal, Que.—Tenders have been received for the construction of sewers in the following streets: Lajeunesse, Mazarin, Roslyn Ave. and Street Cadastral. City Clerk, Rene Banset.

Montreal, Que.—Ten tenders were received by the executive committee for the construction of a sewer on Hochelaga St., between Joliette and Bourbonniere Streets. The lowest tender, \$4,775, was received from A. Thezand, and the highest, 11,500, from U. Savageau. The tenders were referred to A. E. Doucet, Director of Public Works, for a recommendation.

New Westminster, B.C.—Ruskin Operations, Ltd., will apply to the Comptroller of Water Rights for the approval of the plans of the works to be constructed for the diversion of water from Whonnock Creek and Yanaka Creek.

Peterboro, Ont.—The City Council plans the construction of sewers this winter. City Engineer, R. H. Parsons.

Peterboro, Ont.—The section of the Romaine Street sewer from Aylmer St. to George St. is to be rebuilt at a cost of \$9,000. City Engineer, R. H. Parsons.

Peterboro, Ont.—The Board of Works instructed City Engineer R. R. Parsons to have plans and specifications for the proposed sewage disposal plant on the activated sludge principal ordered by the Provincial Board of Health, completed as soon as possible and submitted to the Provincial Board of Health for approval.

Port Credit, Ont.—The council intends to pass the water works by-law at its next meeting, according to Reeve R. M. Parkinson.

St. Catharines, Ont.—According to a statement made by F. A. Dallyn, Provincial Sanitary Engineer, Toronto, a meeting will be held shortly to discuss the immediate de-

velopment of a water works scheme for the municipalities of St. Catharines, Thorold and Merritt, including a filtration plant at DeCew Falls. It is possible that Welland may be asked to join in the scheme.

St. John, N.B.—A bill providing for a sewage district in the Parish of Simonds will be sent to the Legislature for enactment.

St. John, N.B.—An issue of bonds amounting to \$12,000 for fire hydrants in Lancaster Fire District No. 2 has been authorized.

St. John, N.B.—The Committee of the Common Council opened the following tenders for the supply of cast-iron pipe for the water and sewage departments:—S. Norman Sanction, \$55.75, \$55 and \$54.65 per ton for 8, 10 and 12-in. pipe, respectively; Canada Iron Foundry, Ltd. (Vroom & Arnold), \$52, a ton, or \$53.33, including sales tax; B. & S. H. Thompson & Co., Ltd., \$53, \$53 and \$18.50 for 8, 10 and 12-in. pipe per ton; F. Garson, \$38 a ton for 12-in. pipe; T. McAvity & Sons, Ltd., \$53.50, including sales tax; Francis Hankin & Co., Ltd., \$51.25 and \$126.04 for two different grades; Canadian Fairbanks Morse Co., \$172 and \$220.38 per 100 lbs. for two classes of machine-cast pipe. The bids were referred to the city engineer and Commissioner of Water and Sewerage for a report.

Scarboro Tp., Ont.—The Public Utilities Commission will proceed at once with the laying of a number of water mains.

Smith's Falls, Ont.—The Town Council will proceed at once with the construction of a sewer at a cost of \$22,700. Town Engineer, S. B. Code.

Toronto, Ont.—The Board of Control awarded the contract for the construction of a sewer on Woodington Ave. to the Murphy Contracting Co., at \$11,130.

Toronto, Ont.—Contracts for the laying and jointing of water pipes have been let to the Grant Contracting Co., Ltd., Toronto, and Commissioner R. C. Harris.

Toronto, Ont.—A contract for constructing a sewer on Woodington Ave has been awarded to M. J. Murphy at \$11,130. The other tenders offered were for \$29,000 and \$19,400.

Vancouver, B.C.—The water works by-law, calling for an expenditure of \$270,000 on water works and sewage was passed by the ratepayers.

Welland, Ont.—W. E. Forster, city clerk, will call for tenders for the construction of sewers on Garner and Asher Streets.

Welland, Ont.—The City Council may construct a sewer near Garner and Asher Streets. City Engineer, Charles L. Conlson.

Welland, Ont.—In the annual report of the Water Commission to the City Council, Superintendent Milo made the following recommendations: That a system of metering the water be installed; the construction of 6-in. mains on River Road, from Dorothy St. to John St., and on Park St., from South Main to Hester Lane; the extension of the main on State St.; and that the system of mains in the Fifth Ward be somewhat changed, involving the construction of about 1,000 ft. of 6-in. mains and the necessary hydrants.

Whitby, Ont.—The Public Utilities Commission is negotiating with the government with a view to having a larger water works system installed. Chairman, W. J. Luke.

LIGHT, HEAT AND POWER

Brantford, Ont.—A scheme is now before the Water Commission to secure the sanction of the ratepayers for the construction of a new stand-by pumping plant to be run entirely by electricity. Approximate cost, \$200,000 or \$250,000. In addition, it is claimed that an electric generator could be installed in this plant which would in turn supply and sell to the local Hydro Commission a considerable quantity of electricity, enough it is said, to relieve the local Hydro from the necessity of buying a large amount of its required power.

Eastwood Park, Ont.—A committee will wait on the Etobicoke Hydro Commission to apply for Hydro lighting in Eastwood Park.

Fredericton, N.B.—The Provincial Government has sold a bond issue of \$1,890,000 which will be devoted to Hydro-electric development and permanent highways.

Kitchener, Ont.—The Engineering Department of the Hydro-Electric Power Commission of Ontario will install more modern and adequate switching equipment at the Kitchener power station.

Port Moody, B.C.—Thurston & Flavell, Ltd., have awarded a contract to Smith, Robinson & Co., of Vancouver and Victoria, for the installation of a 1,000-kw. generator and the electrification of their mill, at a probable cost of \$60,000.

Toronto, Ont.—The Property Commissioner submitted a report to the Property Committee regarding a proposed new lighting system for the city generally, except in the down-town district. A sub-committee will make an investigation of the situation. The report submitted three different propositions. One is to remove all existing 100-watt tungsten lamps on the streets of the city and substitute therefore 100-watt nitrogen lamps. There are some 46,000 lamps in service. The present rate is \$7 per lamp per annum, and for 100-watt nitrogen lamps the rate would be \$8.50, or a total difference of \$69,000 on the system. This applies to general residential lighting. The other two schemes refer to such business streets as Queen, King, College, St. Helen's Ave., Carlton, Bloor, Dundas, North Yonge and Bathurst streets. To replace the tungsten 100-watt lamps on these streets with 100-watt nitrogen lamps would mean changing 3,012 lights, or an increased cost of \$6.24. The third scheme is to replace these lights with 200-watt nitrogen lamps, and would mean a cost of \$30,120 per year.

Woodstock, Ont.—The officials of East Oxford Township have been notified by the Hydro-Electric Power Commission of Ontario that out of 138 contracts sent in for Hydro power, 130 have been accepted. This means that between 30 and 35 miles of Hydro lines will be constructed on the highways of Oxford Township during the coming summer.

RAILWAYS

London, Ont.—Mayor J. C. Wilson has announced that one of the first acts of the new City Council will be to resume the campaign for the electrification of the London, Huron & Bruce Railway.

Toronto, Ont.—The Hydro-Electric Power Commission of Ontario has been approached regarding the construction of a Hydro-radial line from St. Mary's to Exeter.

Ottawa, Ont.—Notice has been given of applications to be made to parliament at the next session in respect of five railway charters. In each case extensions of time are being asked. The companies applying are: Canadian Pacific Railway Co., in respect to several extensions in the western provinces; the Inter-Provincial and James Bay Co., in respect of a line from the C.P.R. to or near Lamsden's Mills or towards Des Quinze river; La Compagnie de Chemin de Fer de Colonization de Nord for a line from Le Belle to Mont Laurier and Lake Temiskamingue in Pontiac county; the Esquimalt and Nanaimo Railway Co. and the Kettle Valley Railway Co.

St. Catharines, Ont.—A by-law will be submitted to the ratepayers of the Townships of Crowland, Grantham, Humberstone and Thorold, on January 30, in connection with the proposed purchase of the Niagara, St. Catharines & Toronto Railway.

FACTORIES AND LARGE BUILDINGS

Annapolis Royal, N.S.—The contract for repairs and additions to the Court House has been awarded to J. H. Hicks & Sons for \$21,325.

Britannia Beach, B.C.—The following contracts have been let to Vancouver firms by the Britannia Mining and Smelting Co. in connection with the rebuilding of the ore concentrator which was destroyed by fire last spring: For

A Weekly Paper for Civil Engineers and Contractors

Hydro-Electric Developments Near Bathurst, N. B.

Construction Details of Bathurst Co. Ltd. Plant at Grand Falls, Nepisiguit River — Fifteen Miles of Standard Gauge Railway Laid to Work — Power House and Dam of Reinforced Concrete — Transmission Line 19 Miles Long

BY JAMES DICK

Resident Engineer for the Contractors

THE construction work on the Hydro-Electric development for the Bathurst Company, Limited, of Bathurst, N.B., was recently completed and the units installed are in operation supplying power for the saw mills and pulp mill, of that company, at Bathurst.

With the installation of all machinery provided for, the total capacity of the plant will be 13,500 h.p., under a head of 100 ft., and it is understood that the intention of the company is to supply power to neighboring municipalities from the surplus not required by themselves. Little difficulty is anticipated in disposing of the surplus power in the neighborhood and it is expected that there will be an increase in industrial activity now that an ample supply of power is available. A detailed description of the plant and equipment was given in the "Canadian Engineer" of September 23, 1920, but a short description here will not be out of place.

Dam at Grand Falls

The development comprises a reinforced concrete dam and power house built at Grand Falls on the Nepisiguit River, twenty miles from

FIGURE 2

the mouth, at which point the town of Bathurst is situated. A stop log dam 305 ft. long, having 9 openings 16 ft. wide, extends across the river at the head of the falls. From this a spillway dam of the O. G. type extends to the power house and in plan is circular, the curve at the upstream face having a radius of 200 ft. A wing wall between the power house and the hill side forms the other side of the forebay.

This construction raises the level of the river above the falls 23 ft. increasing the natural head of the falls to 100 ft. Flood discharge is regulated through the sluices of the dam by timber stop logs bolted together in pairs making a unit 14 in. x 28 in. deep. These are handled very quickly by an electrically driven

FIGURE 1

lifting machine, the steel stems of which hold the logs from binding during operation. The spillway crest is at Elevation 342, pond level, and the length of discharge is 313 ft. The maximum height of this section is 400 ft. by a width of 38 ft.

Power House and Equipment

The power house is constructed of reinforced concrete and comprises the generator room, transformer room and gate house all under the one roof, the maximum dimensions over all being 93 ft. x 123 ft. The building is situated opposite the foot of the falls and is built on, and into the cliff which at that point is 80 ft. high and practically vertical above the water level.

Space is provided for the installation of three 4,500 h.p. Boving vertical turbines, each direct connected, by a shaft 42 ft. long, to a 3,600 k.v.a. Canadian General Electric Co. 4,400 volt, three phase, 60 cycle generator, operating at a speed of 300 r.p.m. Three 3,600 k.v.a. water cooled transformers are provided for increasing voltage to 33,000, at which it is transmitted. Additional transformers are installed for stepping down voltage to supply power for the operation of motors on pumps, headgates, cranes and also for lighting the plant.

Connection between intakes and turbines is by steel penstocks 8 ft. 6 in. in diameter. The control is at the intake end and is regulated by a butterfly valve operated by motor at the gate house floor. A gravity water supply is installed for serving transformers and the water wheel bearings. Filters are used on the service line to the latter.

Before any construction work could be done it was necessary to lay 15 miles of standard gauge track from Nepisiguit Junction on the Canadian National Railway to the falls. This was laid on the embankment of the Northern New Brunswick & Seaboard Railway, the property of the Canada Iron Corporation, the rails of which had been removed some time ago.

Eighty pound rails were used and laying was done by hand, the material being transferred from steel train, following the laying operations, to lorries. Ties were distributed by wagons and was generally done at night. Owing to the lateness of the season every effort was made to rush this work and including delays and lost time was completed in five weeks.

Topography of Site

The location of the plant and the rugged topography at the site of the work involved features of design and construction which may be of interest. In order to secure the greatest possible head with

SPILLING DAM

the dam as located and designed, the river below the falls was utilized as a tailrace. The falls has a natural head of about 80 ft. and is comprised of three sharp descents the last terminating in a

narrow gorge, the sides of which are from 80 to 90 ft. high rising practically sheer above the water level. To utilize this part of the river as a tailrace it was necessary to excavate into the face of the cliff to provide space for the generating machinery, penstocks and draft tubes.

The excavation was 40 by 87 ft. in plan, at which dimensions it was carried down for a depth of about 80 ft. and a further depth of 22 ft., approximately 30 ft. wide by 60 ft. long, was necessary for the installation of the draft tubes. The side of the excavation was open on the river side down to about four feet above mean water level. It will be noted that the nature of the site presented many problems for the engineers and contractors, more particularly in connection with the construction of the power house but these difficulties were successfully overcome.

The strata of the rock was on an incline with the length of the excavation and at about an angle of 60 degrees with the horizontal. Seams in the rock made it necessary that particular care be taken in the excavation so as to avoid breaking outside the lines laid out for the shaft walls that had to be lined with concrete. The average depth of blasting operations was 12 ft. and forty percent dynamite (Forsite) was used for charges. Ingersoll-Rand drills were used for all heavy drilling and rotating hammer air drills for light work and trimming the sides of the excavation.

Two stiff leg derricks with 60 ft. booms were located at the sides of the cut so as to reach all parts of the work for the removal of the rock without rehandling. As crushed stone was used as concrete aggregate the material from the excavation was deposited by one of the derricks directly to the crusher and the balance dumped in the most suitable place for rehandling to the crusher later. Lack of space for the storage of crushed stone necessitated this, the disposition of excavated material was difficult owing to the steep side hill between the railway and the edge of the gorge.

The steepness of the cliff at the tailrace made it impossible to place a cofferdam so as to unwater the excavation required below the river level for the installation of the draft tubes and the necessary outlet to the river. In order to accomplish this, a section of the rock outside the building line, and extending across the width of the excavation into the cliff, was left intact to act as a cofferdam while the required work was being done. The removal of the natural rock cofferdam presented an interesting engineering feature in this section of the work that it was not accomplished without an element of risk.

Difficulties in Excavation

Careful soundings were taken to determine if the face of the cliff at this point was eroded and undermined by the action of the water. Results showed that the rock sloped gradually to the centre of the pool until a maximum depth of 100 ft. was reached.

This depth made it possible to blast the rock in one shot into the river without fear of blocking the channel.

FIGURE 3

Draft Tube and Power House Excavation

Lower Section of Draft Tube and Rock Wall at Tailrace

The incline of the rock across the excavation, deviating from the general direction encountered elsewhere, sloped toward the excavation and a natural retaining wall section was obtained. The maximum head was 20 ft. and contrary to expectation very little seepage occurred.

The sectional elevations of the power house shown in Figures 1 and 2 gives an idea of the size and appearance of the excavation with relation to the building. Before removing the rock left in the tail race the concrete work was brought up to the intermediate floor at Elevation 278.5 and the floor formed.

Figure 3 shows a typical section of the rock wall and the position with relation to the building and also shows the manner in which drill holes were located.

Owing to the narrow section it was impossible to "spring" the holes for heavy charging as there was danger of flooding the area behind the wall before drilling and loading operations could be completed. The holes were therefore spaced, so as to give as good a distribution of the explosive as possible, from 3 to 5 ft. apart with a maximum depth of 18 ft. The lower sets of horizontal holes radiated from the mouth of each of the three draft tubes from which, owing to the narrow space between building and the rock, the drills operated.

Before the charges were fired the openings in the draft tubes were protected and the space in front of the building was filled with water. Over 600 cubic yards of rock was removed and required 850 lbs. of dynamite.

of the shaft up to the main floor level and the penstocks completely enclosed in concrete, which is carried above them forming the breast wall at the intakes.

FOREBAY, SPILLWAY AND POWER HOUSE

All surface drainage and springs from the face of the rock walls were diverted into a system of box drains fitted to the surface of the rock, and these were connected to a main drain emptying into the tailrace.

To prevent seepage of water from the forebay the foundation under the gate house piers and apron in front of the intakes was carefully excavated to secure bed rock free from seams before concrete was placed.

Each penstock was received in four sections and after each piece was placed the concrete was brought up before the succeeding section was connected. All rivets and connections were carefully caulked and to take care of any possible leakage each penstock was surrounded by a series of weep drains all connected and communicating with the main drain.

The generator floor is of heavy construction, each generator with connecting water wheel superimposing a load of approximately 90 tons. Each unit is carried on two reinforced concrete beams 22 in. wide by 7 ft. 6 in. deep spaced 10 feet apart with a clear span of 24 feet.

A circular wheel pit 10 ft. in diameter is formed be-

VIEW OF POWER HOUSE

Following the completion of this work the building walls of the generator room were built up to the crane beams in order to have the crane installed as quickly as possible for the handling and placing of water wheel equipment, which work was carried on during the construction of the building.

The river is subject to sudden rises at flood water periods and the normal rise below the falls at such times is about 13 ft. making water level 4 ft. higher than the lower floor level. In order to prevent interruption of the work of installing the water wheels, the draft tubes were fitted with timber bulkhead designed to withstand pressure occasioned by any head up to 30 ft.

These were built of 10 x 10 timbers cut to fit the tapered and circular wall of the steel draft tube, and were bolted to the underside of 3 x 3 steel angles fastened around the inside of the tube below the top far enough to be clear of erection operations. In the centre of the bulkhead an 18 in. x 24 in. manhole with watertight cover was provided for access to the underside for caulking and bolting timbers. To prevent a reverse pressure, in the event of a sudden fall in the water creating a vacuum a pipe with a check valve was connected to the bulkheads.

Construction of Power House

The walls of the generator building, with the exception of the downstream wall, are formed against the rock face

SHOWING WATER DIVERTED THROUGH SLUICES

tween the beams, the sides of which with the main beams, provide bearing and anchorage for the generator.

All beams are supported by the mass enclosing the penstocks and on buttress walls at right angles to the downstream wall of the building. These supports extended down to the mass foundation around the draft tubes.

To secure entrance to the generator room for the installation of machinery a roadway was excavated along the top of the cliff from the railway about 500 feet away in order to secure a suitable grade. This terminated at the main door of the power house in a platform 18 ft. wide by 35 ft. long constructed of concrete supported by structural steel beams and struts extending from the wall of the building. The platform is 63 ft. above water level.

With the exception of the section crossing the river channel all foundation excavation required for the dam was in dry land. The material was rock with some overburden of earth. The channel of the river was free from loose material with the exception of some gravel found in deep pockets worn in the rock and an excellent foundation was secured after cleaning.

Unwatering was done in two sections, the first cofferdam being placed from the north shore to mid-stream and then parallel to the flow diverted the water from the site of the north abutment and the two adjoining sluices.

The concrete apron of these sluices was left out so that the water could be diverted through them while construction was being proceeded with across the remaining section of the river bed. A rock reef below this part of the dam was removed to provide a channel for the flow when diverted. The channel closure was made by placing stop logs across

bucket operated by a derrick. Sand was taken from a pit about 1200 ft. away.

Three yard side dump cars of 36 in. gauge were used to transport this to the top of the bins. Cars operated from the pit by gravity and the return was made by cable haul operated by a motor driven hoist located at the pit. Cement was delivered direct from railway cars to a storage building at the rear of the mixing plant.

During a period of the work it was necessary to accept shipments of cement in bulk. This condition not being anticipated, no storage facilities were provided for cement received in this manner. Shipments were therefore arranged so as to have cars arrive during the time in which mixing was being carried on in order that the cement could be sent direct to the mixers. To handle it in this form is was unloaded into boxes each containing the equivalent of one bag and these were placed on a gravity roller conveyor placed between the car and the charging hoppers.

From the sand and crushed stone bins the aggregates were delivered by gravity in chutes to the hoppers above the mixers. Two engine driven mixers each of $\frac{3}{4}$ cu. yd. capacity deposited the concrete into a hoisting bucket by which it was conveyed to the hoppers on the tower above, from there it was distributed by gravity in chutes, one lead-

ing to the power house and another to the dam.

Concrete for the dam was taken from the end of the chute in steel side dump cars of one yard capacity. The narrow gauge track for these was on a trestle above the level of the dam and was extended as the form work progressed. Side chutes were so arranged that concrete could be placed wherever required. Conditions were favorable for placing the greater

part of the concrete in the power house direct from the tower in chutes. For superstructure walls and floors the distribution was made in buggies from platforms placed around the inside of the walls at different stages as the work progressed.

Construction of Transmission Line

The transmission line to Bathurst is about 19 miles long and for 14 miles it is parallel to the railway between the works and Nepisiguit Junction. A single circuit No. 00 B & S standard copper wire is carried on steel poles anchored to concrete bases spaced 400 ft. apart. Standard poles are 32 ft. long built up of 4-2 in. x 2 in. angles spaced 2 ft. 8 in. apart and latticed with 1½ in. x 1½ in. angles. Steel cross arms were provided with top pins for the installation of two circuits. Poles were assembled at the plant and loaded on flat cars for delivery to the various locations along the line. From the end of the railway to Bathurst this work was done by wagons and the poles were generally handled in two sections. Erection was done by block and tackle with gin pole, the only work necessary after pole was vertical being the bolt connections to the angles in the concrete base. Along the railway line an average of 12 poles a day were installed by this method.

At all angles in the line and at important crossings the special towers provided were built up on the site. These are of heavier construction than the standard poles and are anchored to four concrete pedestals.

PLAN SHOWING LOCATION
OF SITE

the openings of the sluices. Projections were built out from the adjoining piers to a height above any water level which might be encountered and the stop logs were held in checks placed clear of the formwork of the sluices.

Cofferdams were built of round timber cribs, rock filled, with two thicknesses of two inch plank on the stream face and a second row of sheeting placed about three feet inside the crib with the intervening space puddled.

Details of Concrete Construction

Concrete work on the spillway dam and the mass foundation of the stop log section was poured in lengths of approximately 50 ft. The vertical joints between the sections were covered with a thickness of tarred felt and suitable keys were formed in the face of the concrete.

Concrete proportions were 1 cement, 2½ sand and 5 crushed stone for all heavy work and 1-2-4 respectively for reinforced. A "Climax" jaw crusher, driven by motor was placed within reach of the derrick removing rock from the power house excavation. The crushed stone was deposited by bucket conveyor into a stock pile, adjacent to the concrete mixing plant, and from there it was transferred to the bins above the mixing room by a one yard clam shell

Copper wire was distributed from a moving train for the transmission line along the railway. Three reels at a time were placed in stands on a flat car at the rear of the train and the wire paid out to the side of the track through snatch blocks on outriggers at the side of the car. After the necessary splicing was done the wire was swung to the cross arms by block and tackle attached to the top of the poles.

The plant was designed by Wm. Kennedy, Jr., consulting engineer, Montreal, the preparation of plans and details of construction were under the supervision of Ernest Loignon who represented him on the work. The work was done under contract by Morrow & Beatty, Limited, Engineering Contractors, Peterborough, Ont., under the direction of L. B. Kingston as general manager. During the time of construction the late Senator Edwards was President of the Bathurst Co., Ltd., and Angus McLean vice-president and general manager.

PRODUCTION OF IRON AND STEEL IN CANADA

The monthly report of the production of iron and steel in Canada for December, 1921, issued by the Bureau of Mines, Ottawa, shows a marked decline in output as well as in prices.

Pig Iron and Ferro-Alloys

The production of pig iron in Canada during December declined to the lowest level for the year, the total pig iron made amounting to only 39,917 long tons, all of which was made in blast furnaces. By kinds of iron produced the outputs for December are as follows: basic, 30,698 tons; foundry, 2,948 tons; and malleable 6,271 tons. Practically all the basic iron was made by the operators for their own further use, only 516 tons being made for direct sale. Foundry iron while showing a considerable decline from the amount produced in November was for the most part made for direct sale, a total of 2,882 tons having been credited to this item during the month. For the first month since August a production of malleable iron was recorded and a total of 6,271 tons was produced for sale.

Ferro-alloys declined from 1,683 tons in November to 846 tons in December, the entire output consisting of the several grades of ferro-silicon.

Two furnaces of the Algoma Steel Corporation which were in blast at the beginning of the month were closed down before the end of the month. The Dominion Steel Corporation also which had two furnaces in blast on December 1, finished up the year with only one furnace working. There were therefore only two furnaces active on December 31st, one operated by the Steel Company of Canada at Hamilton and one by the Dominion Steel Corporation at Sydney. Throughout the greater part of the year at least five furnaces were active, December being the only month in which fewer than five were in blast.

The average monthly output of pig iron in Canada during the twelve months ending December was 50,000 tons, or less than the average monthly record for any year since 1908. Throughout the entire period during which a total of 595,000 long tons of pig iron was made, the market was decidedly quiet and the suspension of interest in iron was general. In the United States as in Canada the final week of 1921 was characterized by a quiet market and declining production. In spite of this there was evidence at the close of the year that there would be an early resumption of activities in the iron trade and the opinion was generally expressed that the first month of the new year would see the beginning of an upward movement in production.

Steel Ingots and Castings

The decline in the output of pig iron during December, and the generally dull market for steel resulted in a marked falling off in the production of steel ingots and castings, the decline from November amounting to more than 30,000 tons. The outputs for the months of November and December were respectively 75,039 tons and 42,653 tons. Of the December output 41,100 tons consisted of basic open

hearth steel ingots made by the producers for their own further use in manufacturing. A total of 1,551 tons of direct steel castings was made, of which 1,458 tons was produced for direct sale, comprising 657 tons of basic open hearth castings, 97 tons Bessemer castings, and 704 tons of steel castings made from electric furnaces. During the month 93 tons of direct steel castings was made by the firms reporting for use in manufacturing in their own plants.

During the twelve months ending December 667,484 long tons of steel ingots and castings was produced as compared with 1,109,000 tons made during 1920. The average monthly production during the year just closed was 56,000 tons as compared with 92,000 tons during the preceding year. Of the total production of steel ingots and castings during 1921, 645,075 tons was in the form of direct steel ingots comprising 641,882 tons of basic open hearth steel, 239 tons acid open hearth steel, 94 tons Bessemer, and 2,860 tons made in electric furnaces. The whole basic and acid open hearth production of steel ingots was made by the operators for the use of their own mills. Of the Bessemer ingots produced 37 tons was used directly and the balance was produced for sale. A total of 2,200 tons of electric steel ingots was used by the plants reporting and 660 tons was made for sale.

Steel castings produced during the year amounted to 22,409 tons, comprising 6,531 tons basic open hearth, 256 tons acid open hearth, 1,638 tons Bessemer and 13,984 tons castings made from electric furnaces. Of the whole amount 18,495 tons was made for sale and 3,914 tons used by the firms reporting. An analysis of the 18,495 tons of direct steel castings made for sale shows 5,031 tons was made by the basic open hearth process, 252 tons in acid open hearth furnaces, 1,401 tons by the Bessemer process and 11,761 tons from electric furnaces.

The low price of steel in December was not only the lowest for the year but was lower than at any time since January, 1916. While the production of steel during 1921 was less than for any preceding year since 1908 the sentiment prevailing in the steel trade at the end of December was favorable to an early resumption of activity and hope was everywhere expressed that the early months of the new year would be marked by a resumption of construction work as a result of the more favorable purchasing market established and that as a consequence a considerable development in the production of steel might be expected.

NEW CANADIAN COMPANIES INCORPORATED IN 1921

AUTHORIZED capital of \$778,173,149 is represented by new companies, incorporated in the first eleven months of 1921, according to "The Monetary Times'" estimate. Companies with Dominion charters constitute \$336,854,650, or about 45 per cent. of the total. Ontario claims about 30 per cent.

The following table gives the details for the eleven months:

Dominion	\$335,854,650
Alberta	17,958,000
British Columbia	74,997,000
Manitoba	32,942,000
New Brunswick	1,135,100
Ontario	239,700,585
Prince Edward Island.....	600,000
Quebec	69,495,499
Saskatchewan	5,490,500
Total	\$778,173,149

There were only six with a capital of \$10,000,000 or over, against twenty during the first eleven months of 1920. The 1921 list is as follows:

Southern Alberta Oils, Ltd., Calgary, \$10,000,000; Harrison Lumber and Pulp Co., Ltd., Vancouver, \$15,000,000; Bathurst Co., Ltd., Bathurst, \$15,000,000; J. E. Booth Co., Ottawa, \$10,000,000; Canadian International Paper Co., Three Rivers, \$20,000,000.

Engineering Institute's Convention at Montreal

Two-Day Session Held Last Week — Combined Annual and Professional Meeting — Reports of Committees and Branches — Presidential Address — Officers Elected—Papers on New Shawinigan Turbine and St. John Bridge

APPROXIMATELY four hundred engineers attended the thirty-sixth annual meeting of the Engineering Institute of Canada, held last week in Montreal. The meeting had been scheduled to be held in Winnipeg, but it was decided a few weeks ago that it would not be advisable to take the annual meeting to the West until next year. Due to the short time available in which to prepare a new program, the Montreal meeting was briefer, more routine and not so well attended as has been the standard in the Institute during the past few years.

J. M. R. Fairbairn, president of the Institute and chief engineer of the Canadian Pacific Railway, called the meeting to order at 10 a.m., Tuesday, January 24, in the assembly hall of the Institute's headquarters building. F. S. Keith, secretary of the Institute, read a telegram from the secretary of the American Federated Engineering Societies, inviting the Engineering Institute of Canada to join the American Federated Engineering Societies. It was decided to discuss the invitation later in the day under the head of "New Business."

Mr. Keith presented the minutes of the last annual meeting of the Institute, held in Montreal, January 25, 1921, and in Toronto, February 1, 1921, and they were taken as read and adopted.

President Fairbairn appointed W. S. Lea and C. K. McDougall as scrutineers to report upon the balloting for officers for the ensuing year.

Upon motion of H. G. Acres, the auditors, Riddell, Stead, Graham & Hutchison, chartered accountants, were appointed for another year.

Report of Council

Secretary Keith read the report of the Council of the Institute for 1921. Three new branches were established during the year: London, Ont., Lethbridge, Alta., and the Cape Breton branch.

"It is undeniable," said the Council, "that the year just closed has been one of the poorest from the viewpoint of engineering operations for many years. It is some satisfaction to note that the outlook for the coming year is more promising."

"The difficulties involved in connection with the work of the Committee on Policy, due to its breadth of scope and the many factors presented to it for consideration, became apparent during the year, and although the Committee has done a great deal of work it has been found impossible to put the result into final shape without a meeting of the committee, and it is therefore recommended to the incoming Council that a meeting be held shortly of the committee."

"Classification and Remuneration have been advanced to a point here the committee's final report is under consideration by Council at the present time, and it is anticipated that this report will be submitted to the various branches in the immediate future, for discussion and suggestions."

Membership of Institute

There was an increase in membership of the Institute of about 15% during the past year, stated the report of the Council, 71 members, 330 associate members, 115 juniors, 347 students and 10 associates having been admitted, while resignations and removals from the roll totalled 16 members, 50 associate members, 71 juniors, 106 students and 10 associates. Death was responsible for the loss of 32 other members of the Institute during the year. At present the membership totals 4,688, including 10 honorary members, 1,018 members, 2,285 associate members, 438 juniors, 899 students and 38 associates; and in addition, 191 mem-

bers of various grades have been elected whose acceptance of membership is still pending.

Finance Committee's Report

R. A. Ross, chairman of the Finance Committee of the Institute, presented the report of that committee, showing \$39,877 income from fees, \$6,204 net profit on publication of the Institute's "Journal," and \$1,416 income from other miscellaneous sources. The expenditures totalled \$37,183, leaving a balance of \$10,313 as surplus of revenue over expenditure. The assets of the Institute now amount to \$115,088, and the liabilities to \$24,333, of which \$22,000 is the mortgage on the headquarters property. The surplus amount stands at \$90,755. It is intended to apply \$10,000 of the surplus for the year 1921 to a reduction of the mortgage on the Institute's headquarters property, which will then leave a mortgage of only \$10,000 outstanding.

Budget Closely Estimated

The year 1921 was the first year during which the financial affairs of the Institute were conducted upon the budget system. The estimated operating surplus appearing in the budget prepared early in 1921 was \$10,468. The actual operating surplus certified by the auditors was \$10,313, or only \$155 less than the estimate, which certainly speaks well for the business foresight and judgment of the members of the Finance Committee.

Committee Reports

Routine reports were received from the Library and House Committee, Legislation and By-laws Committee, Papers Committee, Publications Committee, Canadian National Committee of the International Electro-Technical Commission, Civil Service Classification Committee, Honor Roll and War Trophies Committee, Publicity Committee, Uniform Steam Boiler Specifications Committee and the Committee on International Co-operation.

Walter J. Francis, chairman of the Committee on Legislation and By-laws, stated in his report that the committee had "kept in close touch with the legislation situation throughout the whole Dominion, and confidently believes that the period of evolution through which the profession is now passing will end in the haven of recognition already attained by our sister professions — law and medicine. This end cannot be reached by us, however, until its need is fully recognized by our members, and by everyone engaged in any branch of the profession, as well as by our legislators, and it is more than ever incumbent upon us, each and every one, to act in such a way that the public will appreciate our high ideals and in the end realize the wonderful part the engineer is playing in our great civilization."

In the report of the Canadian Engineering Standards Committee, of which Mr. Francis is also chairman, he states there are now about 250 members on the various working committees of the Canadian Engineering Standards Association. Standard specifications for galvanized telegraph and telephone wire and for wire rope for mining and dredging purposes were issued during the past year, and a standard specification for Portland cement is now in press.

"The following publications," states Mr. Francis, "are in an advanced stage of progress, and will shortly be ready for submission to the Main Committee for authority to print: Reprint of Standard Specification for Steel Railway Bridges; Standard Specification for Steel Highway Bridges; Standard Requirements for A.C. Watt-hour Meters."

"During the last few weeks a number of important suggestions for activity have been received, among which may be mentioned one from the Automobile Club of Canada

requesting the formation of a committee to draw up, if possible, specifications for gasoline, which will be acceptable to, and used by the manufacturers, and one from the Dominion Highways Commission, asking for the organization of a sectional committee on road materials and construction, with the view of obtaining the co-operation of the various provincial highways authorities, engineers and contractors, in defining and specifying road materials and methods so as to avoid confusion and secure uniformity wherever possible in the requirements for this important work throughout the Dominion."

Prof. L. A. Herdt, chairman of the Canadian National Committee of the International Electro-Technical Commission, reported that Canada will probably be represented by Major Edgcombe at the international conference in Paris on technical problems of high-tension distribution.

W. A. McLean, chairman of the Roads and Pavements Committee, submitted a report which appears in full on another page of this issue.

Award of Gzowski Medal

The Gzowski Medal Committee announced its award for 1921 to P. Ackerman for his paper on "Relay Protective Features of the Toronto Transmission and Distribution System." The winner of the student's prize was A. M. Robertson for a paper on "Organization of Engineering Services during the War."

Concrete in Alkali Soils

The Committee on Deterioration of Concrete in Alkali Soils, in a report signed by its secretary, Prof. G. M. Williams of the University of Saskatchewan, announced that a total of \$13,200 had been contributed to the funds of the Committee, as follows: Canada Cement Co. \$3,000, C.P.R. \$1,000, City of Winnipeg \$200, Province of Alberta \$1,000, Province of Saskatchewan \$3,000, and the Research Council \$5,000. Approval was asked of the appointment of Dr. T. Thorvaldson, professor of chemistry at the University of Saskatchewan, as chemist in charge of the committee's chemical research for a period of two years. It was decided to discuss this appointment under the head of "New Business."

C. C. Kirby, of St. John, N.B., requested that the scope of the committee's investigations be widened to include deterioration of concrete in sea water, but it was decided that this could not be done because the committee's funds had been donated for the particular purpose of investigating deterioration in alkali soils; and, moreover, because committees have been at work for years, in the United States and many other countries throughout the world, on the sea-water problem, and it was thought best not to endeavor to duplicate that work but rather to confine the committee's funds and effort to a solution of what is more essentially a Canadian national problem.

J. A. Jamieson said that the trouble in alkali soils is due entirely to chemical reactions, while in sea-water frost is a big item. Both investigations are very important, he said, and any information gained by the western committee should be available at once to the committee of the St. John Branch who are working on the sea-water problem, and vice versa.

Publicity and Legislation

In discussing the report of the Publicity Committee, R. A. Ross urged the publication of more information about engineers and engineering in the daily newspapers. He said that the public should be properly impressed with the fact that there is not a single thing in the way of public utilities or similar advancement that is not due to engineers. He announced that the Research Council intends very soon to send out a series of articles on research in order to endeavor to secure public backing for the movement to establish a research institute at Ottawa.

J. B. Chailles, discussing the report of the Finance Committee, suggested that in view of the large surplus on the year's operations, the loan of \$400 made by Council to the Ontario Provincial Division in connection with ex-

penses re legislation, be considered as a gift instead of as a loan. This request did not meet with much sympathy from the Quebec and New Brunswick members, who appeared to be of the opinion that there are enough engineers in Ontario to be able to finance their own legislation. Ontario engineers pointed out that one-third of the membership of the Institute are resident in Ontario, and that if that province does not adopt suitable legislation for regulating the profession, the progress of legislation in other provinces will be hampered, and that certainly it will not work so smoothly as it would were Ontario well in line. The matter was finally referred to the incoming Council with power to act.

Luncheon at Windsor Station

At 12:30 the meeting adjourned and the members walked to the C.P.R. Windsor Street Station, where luncheon was served in the mezzanine dining room. There were no speeches, but the secretaries of the branches from Sault Ste. Marie to Halifax, nearly all of whom were present, were introduced. At 2:30 p.m. the annual meeting was resumed at headquarters, with H. G. Acres, vice-president of the Institute, in the chair.

Nominating Committee

Announcement was made of the election of the following as members of the nominating committee for the ensuing year: John Murphy (representing the Ottawa and Kingston branches), H. Thorn (Border Cities Branch), G. D. Macdougall (Cape Breton), C. MacN. Steeves (St. John), C. J. Mackenzie (Saskatchewan), J. Muirhead (Vancouver), P. L. Allison (Peterborough), J. A. McFarlane (Hamilton), J. D. McBeath (Moncton), F. W. Alexander (Calgary), A. J. Grant (Niagara Peninsula), William Storrie (Toronto), J. G. Legrand (Winnipeg), F. A. Bowman (Halifax), C. C. Sutherland (Edmonton), B. E. Barnhill (Sault Ste. Marie), A. B. Normandin (Quebec), G. N. Houston (Lethbridge), O. O. Lefebvre and P. B. Motley (Montreal) and K. M. Chadwick (Victoria).

Proposed Amendment to By-laws

Mr. Acres read a petition from the Ontario Provincial Division to amend the by-laws so as to make every retiring branch secretary an ex-officio member of the branch executive for a period of one year following his retirement as secretary. Secretary Busfield, of the Montreal Branch, stated that his branch had discussed the proposed amendment and were opposed to it on the grounds that a very good secretary might make a poor executive official, and also because a branch which desired to get rid of a poor secretary would be saddled with him as a member of the executive for a year. After considerable discussion it was decided to let the proposed amendment take the usual course and be sent out for letter ballot.

Resolutions re Deceased Members

A resolution was adopted expressing regret at the sudden death recently of Eugene D. Lafleur, who was for many years chief engineer of the Department of Public Works, Ottawa. Fitting tributes were paid to his memory by a number of speakers, including Geo. A. Mountain, chief engineer of the Board of Railway Commissioners, Ottawa, who had known Mr. Lafleur for forty years and had been associated with him in many undertakings. Mr. Acres referred to Mr. Lafleur as one who had labored long and honorably in the service of his country.

A similar resolution was adopted in regard to the death of Sir John Kennedy, one of the past presidents of the Institute and the dean of the engineering fraternity in Canada.

Report of Branches

The routine reports of the branches and of the Ontario Provincial Division were received and adopted, and the "New Business" was reached on the agenda of the meeting. The appointment of Prof. Thorvaldson by the Committee on Deterioration of Concrete in Alkali Soils was approved upon the distinct understanding that the Institute

is not to be held liable in any manner for any portion of his salary, which, it is understood, is to be met from the funds already contributed to the committee from other sources.

Recognition Follows Service

There was considerable discussion regarding publicity for engineers in connection with a motion introduced by C. A. Mullen, but no suggestions of any value were forthcoming and the discussion was finally closed by Mr. Acres with the assertion that publicity will follow meritorious work without solicitation, and that if every engineer will do his work to the very best of his ability and do it faithfully and well, that recognition and publicity and remuneration will follow as surely as night follows day.

Election of Officers

The report of the scrutineers, announcing the officers elected for the ensuing year, was as follows:

President—J. G. Sullivan, consulting engineer, Winnipeg.

Vice-presidents—Gen. C. H. Mitchell, dean of the Faculty of Applied Science and Engineering, University of Toronto; and Arthur Surveyer, consulting engineer, Montreal.

Councillors—Geo. McLeod, engineer of sewers, City Hall, Montreal; J. Duchastel, city engineer, Outremont; J. E. Gibault, division engineer, C. N. R., Levis, Que.; A. F. Stewart, chief engineer, C.N.R., Moncton, N.B.; Col. Alex. Macphail, Queen's University, Kingston; R. O. Wynne-Roberts, consulting engineer, Toronto; C. H. E. Rounthwaite, Sault Ste. Marie; Lt.-Col. D. A. Ross, consulting engineer, Winnipeg; Prof. A. R. Greig, University of Saskatchewan; R. S. L. Wilson, University of Alberta; Major Geo. A. Walkem, Vancouver Machinery Depot, Vancouver.

Presidential Address

Mr. Acres called upon the retiring president, Mr. Fairbairn, for the annual presidential address, stating that the pleasure of hearing Mr. Fairbairn's speech would be tempered by a very full measure of regret at his retirement as chief executive officer of the Institute.

Mr. Fairbairn expressed the opinion that the expected reaction from intense war-time activity had reached its maximum, and that business is again on the upgrade, although there must be a further downward trend in the prices of many commodities and a considerable increase in the demand for manufactured products in order to bring conditions back to normal. The decrease in business during the past year had worked a hardship on the younger engineers, said Mr. Fairbairn, but there are now signs of improvement and it remains only for us all to help one another over the few rough spots that may still appear, in order to tide everyone over until we reach the prosperity that must await an intelligent and industrious people in such a young and wealthy country.

The activities of the 22 branches of the Institute constitute the most important phase of its work, continued Mr. Fairbairn, and it is encouraging to note that every branch had held meetings and was active throughout the year, and that all of them had grown in membership. Dr. Geo. Herrick Duggan, upon his retirement from the presidency of the Institute in January, 1917, had exhibited a number of charts showing the increase in growth in membership of the Institute from its organization in 1887 to the end of the year 1916. Mr. Fairbairn said that he had extended the curves plotted by Dr. Duggan to show the figures to the end of 1921, with the following results:

The members increased from 700 in 1916 to 1,000 in 1921; the associate members, from 1,500 to 2,300; the non-corporate members, from 900 to 1,600; the total, from 3,100 to 4,900, or an increase of 1,800, or more than 50% in five years.

Mr. Fairbairn showed a chart of the division of membership geographically. Of the total membership 35% reside in Ontario; 21.5% in Quebec; 8.5% in British Columbia; 6.1% in Alberta; 8.2% in Manitoba; 3.8% in Nova Scotia; 4% in New Brunswick; 3.3% in Saskatchewan; and 9.6% in the United States and elsewhere.

Among the subjects to which attention must be given by the Institute, declared Mr. Fairbairn, are professional ethics, publicity for engineers, enrolment of more student members and a reclassification of members or the organization of additional classes in order to broaden the Institute and take in many men who are not at present eligible for membership in the existing classes.

Expressing regret at the absence of the president-elect, J. G. Sullivan, who was unavoidably detained by important business in Winnipeg, Mr. Fairbairn read a message from Mr. Sullivan reminding the members of the professional meeting to be held in Winnipeg in September, and inviting them all to attend.

Annual Banquet

The annual banquet of the Institute was held in the Prince of Wales Room, Windsor Hotel, and was followed by a smoker and vaudeville entertainment.

Visited Dominion Engineering Works

Special cars left the Windsor Hotel at 9:30 a.m. Wednesday to convey the members to the plant of the Dominion Engineering Works, Ltd., at Rockfield, where they inspected the 41,000-h.p. hydraulic turbine now under construction for the Shawinigan Water & Power Co., and other large machinery now being built at that plant, including the largest Larner-Johnson valve ever constructed, some large newsprint machines and three 30,000,000-gal. single-stage, 240-ft. lift, centrifugal pumps in hand for the city of Montreal.

Romance of Engineering

Luncheon was served in the Rose Room of Windsor Hotel at 1 p.m., followed by an address entitled, "The Romance of Engineering," by Prof. H. E. T. Haultain, of the University of Toronto. The title was, perhaps, somewhat misleading, as Prof. Haultain did not deal with the romance of engineering work but rather with the romance that possibly awaits any young lady who interests herself in the welfare of the young engineers who are graduating every year at McGill, Toronto and other universities. Prof. Haultain's address was modelled closely upon the Sir Andrew Macphail style, and, like the latter's after-dinner speeches, aroused all sorts of comments varying from enthusiastic approval to severe censure.

Julian C. Smith's Address

John T. Farmer, vice-chairman of the Montreal Branch, called the first session of the professional meeting to order at the headquarters building at 3 p.m. Mr. Farmer was chairman of the committee on arrangements for the meeting, and it was largely to his efforts that its success was due.

Julian C. Smith, vice-president and general manager of the Shawinigan Water and Power Co., gave an illustrated address on the new 41,000-h.p. unit now being installed at Shawinigan Falls. The paper was followed by a lively discussion which lasted until nearly 5 o'clock. A report of some of the features of design outlined by Mr. Smith will appear in an early issue of "The Canadian Engineer."

St. John Cantilever Bridge

In the evening it had been intended to have a paper on "Electros and Atoms" by W. B. Cartmel, of the Northern Electric Co. On account of serious illness Mr. Cartmel was unable to be present, and Major Draper, of the C.P.R. Bridge Department, gave an excellent impromptu address on the new St. John Cantilever Bridge. Major Draper's remarks will be fully reported in an early issue of "The Canadian Engineer."

Mimico and New Toronto have a joint water commission and a joint sewerage commission, and it was discovered recently at a meeting of the New Toronto council that Mimico has been buying water from New Toronto for 7 1/2 cents per 1,000 gallons and selling it to the sewerage commission, for which New Toronto pays half the bills, for 15 cents per 1,000 gallons.

SOLVING THE PROBLEM OF ST. LAWRENCE NAVIGATION

Shortcomings of Schemes So Far Proposed — Navigation Value of Side Canals Questioned — Two Stage Development on International Section Favored.

By Chas. P. Loveland

President, Great Lakes & Atlantic Canal & Power Co., Ltd.

FOR many years there have been insistent demands for improved waterway communication on this continent, particularly between the various points on the Great Lakes and the seaboard. The five great inland seas known as the Great Lakes are surrounded by a vast expanse of fertile country, rich as well in mineral and other resources, and capable of supporting an enormous population. Numerous great cities have grown up on the shores of these lakes, and commerce between them is largely waterborne, often in steamers rivalling those of the ocean in size and other essentials. Trade with the outside world, however, must be carried on by aid of either railroads or small canal-size boats to the seaboard, there trans-shipping to ocean carriers, with great attendant expense and delay. This fact has caused much dissatisfaction and public protest. At the same time, certain interests have been working so diligently to obtain the control of waterpowers on the St. Lawrence River, that finally the Canadian and United States governments directed the International Joint Commission, which has control of boundary waters under the Ashburton and succeeding treaties between the United States and Great Britain, to investigate and report on the possibilities of making the St. Lawrence River navigable for sea-going vessels of large capacity from the head of deep water navigation at Montreal to Lake Ontario, as well as those of the development of the available waterpower.

It is a matter of common knowledge that the Commission has held numerous public hearings, where the topic has been freely discussed by many interested parties. As a result, several schemes have been proposed to the Commission for St. Lawrence River improvement, one by the engineers of the Commission itself, and others by various public and private interests. While differing in details, these schemes all resemble each other in the following particulars.

Schemes Proposed

Each scheme provides for an elaborate power development on the International stretch of the river between Prescott and the Quebec boundary at St. Regis. The various deep pools created by the waterpower development are to be connected by locks, thus making this section of the river navigable for deep draught vessels. The cost of this part of the whole project would be apportioned between Canada and the United States, and would undoubtedly be partly repaid in time by receipts from the sale of power.

Various schemes are proposed for the improvement of navigation between Lake St. Francis and Montreal, none of which is adequate for the future demands of transportation, as they all propose tortuous, narrow channels which could only be negotiated by large vessels at a much slower speed than that maintained in the present canals by ordinary canal-size steamers, and even then only with considerable danger both to themselves and to others. Power possibilities in this section of the river, though greater in quantity and closer to markets, as well as more easily and cheaply developed, seem to be relegated to the far-distant future in all these schemes. In at least one of these projects it is even proposed that when developed, the receipts from the sale of power shall be partly applied to the reimbursement of the cost of developing the International section, thereby admitting that the latter project is not self-supporting.

The portion of the St. Lawrence just considered, i.e. that from Lake St. Francis to Montreal, lies entirely in Canada, and it is inconceivable that Canada seriously consider allowing another nation to contribute officially towards the cost of improvements wholly in Canadian ter-

ritory. On the other hand, American citizens will secure the major portion or the benefit to be derived from these improvements, at least for many years, and Canada would hardly be justified in undertaking such an expense in the present state of her finances, nor until her own needs may warrant it.

Outcome of International Development

In the event that the governments of the United States and Canada should commit themselves to one of the schemes proposed, it seems to the writer that the net result would be about as follows:

The hydraulic power of the International section of the river would be fairly well developed.

By the insertion of a few locks in the dams necessitated by this development, part of the cost of construction could be charged against "improvement to navigation," thus ostensibly permitting the electric power to be sold at a reasonable figure.

Owing to the great cost to Canada and the doubtful value to anyone of the navigation improvements proposed below Lake St. Francis, as well as the prevention of power development by private enterprise while the government was committed to one of these schemes, work on this section of the river would be deferred for many years, automatically nullifying the effect of the navigation improvements already referred to on the International section.

In short, the interests which have been agitating for hydro-electric power from the Long Sault would have it supplied to them at a nominal rental, and nobody else would get anything within the lifetime of the present generation.

The writer must not be understood as taking a gloomy view of the possibility and feasibility of navigation for deep draught vessels between the Great Lakes and the ocean. On the contrary, in this article he will outline a project which he and his associates have been studying for many years, which will provide for the reasonable needs of navigation for all time to come. Before proceeding to describe this project, it will be well to state the situation as it is, and the problems to be solved to render it as nearly perfect as is economically practicable.

Existing Situation Analyzed

The territory surrounding the Great Lakes and tributary thereto comprises the largest uniformly productive region of the North American Continent. It now supports a very large population, and can support many times the present number. There is no doubt that this number will be doubled within a very few decades. The products of this great inland empire are greatly in excess of the quantity needed by its inhabitants, and Europe, on account of the requirements of its dense population, offers the best and closest market for this excess production.

While Nature provided these great inland seas capable of carrying a tremendous tonnage, she could only find one route by which their surplus waters could reach the sea. Strange as it might seem, this channel (the St. Lawrence River) coincides with almost the most direct route from the most populous part of the Lake region to England and neighboring European countries. Ocean navigators, whenever possible, when sailing from one port to another, follow the arc of a great circle, as being the shortest distance between the two ports. Were there nothing but open ocean between Lake Erie points and, say, England, the great circle followed by ships trading between them would pass through Lake Ontario and closely approximate the present course of the St. Lawrence River and Gulf.

The quantity of water flowing from the Lakes to the ocean via the St. Lawrence is so great and so uniform throughout the year that it is possible to provide an improved channel capable of carrying ocean steamers of the largest size at regular speed with safety, and at the same time develop a quantity of electric energy probably over half as great as the total so far hydraulically produced in the United States and Canada, from the sale of which a large part, if not all, of the cost of the improvement could be defrayed.

From the foregoing paragraphs the deduction may be drawn that within a comparatively short period of time the demands of commerce as well as those of industry will be so imperative that it will be absolutely necessary to complete the work that Nature has so well begun. By so doing, the needs of navigation will in all human probability be met for all time, as it seems as though ocean carriers had about reached their economic limit of size. It follows that any local improvement work undertaken along the route to be followed by navigation should be so designed and constructed as to form part of one harmonious whole capable of meeting all demands, or it would soon be out of date and would have to be rebuilt at great expense.

It will be possible ultimately to so regulate the level of Lake Ontario as to give a minimum discharge the year around of 225,000 cubic feet per second. On this basis the maximum power development at minimum discharge will total, between Lake Ontario and Montreal, about 5,050,000 h.p. Of this quantity, about 2,050,000 h.p. can be developed in the international river, and about 3,000,000 h.p. between Lake St. Francis and the harbor of Montreal.

Any scheme of improvement to navigation in the St. Lawrence River should recognize the necessity of early regulation of the flow below Montreal. It should also be realized that some time the Ottawa River will be made navigable for large vessels, and suitable provision for the effect of this work on the St. Lawrence should be made.

Proposed New Plan

The writer's proposals for the permanent improvement of navigation between Lake St. Peter and Lake Ontario, stated briefly, include the following major undertakings:

(1) Regulating dam, with lock, across the Berthier Islands, holding the St. Lawrence at about standard high water level. This would do away with all swift currents, as well as future dredging operations, in the St. Lawrence as far as Montreal harbor, and in the Richelieu as far as Chambly Basin.

(2) Improvement of the Richelieu to Lake Champlain.

(3) Navigation and power canal from Lake St. Francis to Chambly, with connection to Montreal harbor. Power can be developed at several locations between Melocheville and Laprairie, or, if conditions warrant, the entire available power of the four rapids can be developed at a point near Laprairie Basin, within ten miles of Montreal, the metropolis and chief industrial city of Canada.

(4) International regulating works near the head of the Long Sault Rapids, with navigation and power canal on the Canadian side, developing the Canadian share of the power available between the Rapide Plat and Lake St. Francis on Canadian soil at Cornwall.

(5) Removal of the Rapide Plat.

(6) International regulating works a short distance above Iroquois Point, with navigation and power canal on the Canadian side, developing the Canadian share of the power available between Lake Ontario and the Rapide Plat on Canadian soil at Iroquois.

By this plan, each nation would have control of the works on its own side of the border, subject only to free use by the other of its navigation facilities.

Apart from the fact that the St. Lawrence River forms the international boundary for a certain distance, its only international feature is the fact that Great Britain and the United States have agreed by treaty that its channels shall be equally free and open to the vessels of both nations. In this connection it should not be forgotten that competent authorities have held that this or any other provision of the treaty could be nullified by the legislative branch of either government. The St. Lawrence is by nature a one-way stream, as no vessels have yet been designed which can climb its rapids, and up to the present all users of the river for upstream navigation have passed through the Canadian channels, which have been equally free to vessels of British or American registry.

The question, however, has now arisen of the adoption of a comprehensive plan of development of the river

to its fullest extent, both for navigation and power. Reference has already been made to the impracticability of joint participation by Canada and the United States in this work where the river flows wholly through Canadian territory, and the present inadvisability of Canada engaging itself to perform it alone as a government project. The reason there given of the expense involved does not of course apply to so great an extent in the International stretch; it does, however, exist in such degree as to warrant limiting the work to be done at joint expense and under joint control to the smallest amount consistent with the full development of navigation and power. We must also always remember that disagreements as to policy, etc., are as likely to arise between nations as individuals, and the uncertain duration of treaties makes it advisable, especially in the case of permanent works, to assign as little as possible of operation and control to joint supervision, and leave each nation as much freedom as possible to carry out its own ideas and designs.

Two-Stage Development Proposed

Various schemes have been proposed, both for single stage and two-stage development of the power or the International river. The writer favors a two-stage development. By carrying out the works at the locations he has indicated there will not only be less interference with existing works and less flooding of valuable lands than by other schemes, but the only joint construction work needed will be the two regulating dams one at the Long Sault and the other above Iroquois. The effect of these dams will be, to state it bluntly, to split the flow of the river in two equal parts, and divert one half to the Canadian side and the other to the American side. Each nation can then exercise absolute authority over the works required on its own side of the river, subject of course to the approval of plans by the International Joint Commission. Navigation canals on the Canadian side will also act as head-races for the Canadian power plants, and undoubtedly locks would be provided in connection with the American power developments as well, thus doubling the locking capacity and providing against congestion and accidents. The two regulating dams of course would have to remain under some kind of joint control, their only function being to adjust, mechanically, as closely as possible, any inequalities in the quantity of water passing on each side of them.

It may seem that the improvement work proposed from Lake Ontario to Lake St. Peter, and via the Richelieu to Lake Champlain, may be resolved into five principal divisions, each of which is a project in itself practically independent of the others, and each of which is believed to have sufficient earning capacity, through the sale of power, to repay the invested capital, with interest, within a reasonable time, besides the ordinary expenses of operation and maintenance.

The five main divisions are as follows:

First Division—Lake St. Peter via the St. Lawrence to Montreal Harbor, and via the Richelieu to Chambly Basin, with incidental power development.

Second Division—Chambly Basin to Lake Champlain; with incidental power development.

Third Division—Montreal Harbor to Lake St. Francis, connecting with the Richelieu near Chambly; with major power development near Montreal.

Fourth Division—Lake St. Francis to Morrisburg, with Canadian power development at Cornwall.

Fifth Division—Morrisburg to Lake Ontario, including removal of the Rapide Plat, channel improvements to Lake Ontario, and power development at Iroquois.

When completed as proposed, the least width of navigable channel will be 600 ft., the least depth 35 ft., and the swiftest current less than two miles an hour. Those dimensions will allow the largest vessels to pass at usual speed, without danger to themselves or others.

Power Company's Plans

The Great Lakes and Atlantic Canal and Power Co., Ltd., which was organized in 1914 under Dominion of Canada

charter for the express purpose of financing means of construction of a deep, speedy, navigable waterway from the Great Lakes to the ocean, has adopted the writer's project in toto. As the Third Division is by far the largest and involves the longest time for completion, besides being contiguous to Montreal Harbor and for that reason naturally the next section for development, it is the company's intention to begin operations in this division, on which it has acquired valuable rights and privileges. Plans are already before the Dominion authorities, for their approval, of a project owned by the company, which will form part of the navigation canal proposed by the writer on this division.

At the same time, it is intended that work shall proceed on all the divisions so that they will be completed practically simultaneously, for obvious reasons. The constantly increasing demands for power lead us to believe that by the time the works are completed, the market will absorb all the power that can be delivered.

It is not within the scope of this brief exposition of the subject of this article, to enter into the maze of technical details, nor even to discuss costs, further than to say that the writer's investigations have convinced him that the work can be completed on the lines as he has recommended at as low a total cost as any of the less comprehensive projects thus far advanced, and with much greater material benefit to all concerned.

In the year 1905 the East Jersey Pipe Company introduced "Lock Bar" steel pipe and since that time this pipe has been manufactured by the East Jersey Pipe Company at its Paterson, N.J., plant. Recently an agreement has

been reached between the East Jersey Pipe Company and the Riter-Conley Company whereby "Lock Bar" steel pipe will hereafter be fabricated in the Pittsburgh district by the Riter-Conley Company at its Leetsdale plant. This arrangement is a decided step forward and will permit considerable saving in freight rates as well as economy in manufacturing. "Lock Bar" pipe has enjoyed an ever increasing demand as a carrier for both water and gas, and in both Canada and the United States the entire water supply of many a community is dependent upon it. The sale of the pipe will continue to be exclusively in the hands of the East Jersey Pipe Company.

Canadian Pacific Railway executives have postponed for several months appropriations for improvement and extension of western lines of the road, according to a statement issued by D. C. Coleman, vice-president in charge of western lines. This is due to present commercial conditions which have imposed a policy of caution with regard to large capital expenditures. Works of urgent character only will be started at present, Mr. Coleman stated, the most important project being the building of a large ocean pier at Vancouver. All extension work on branch lines, which usually is planned at this time of year, is held over for later consideration until indications of a steady revival in railway traffic may become more definitely apparent.

It has been decided to hold the Annual Convention of the Canadian Good Roads Association at Victoria, B.C., on June 13 to 17 inclusive. The convention is expected to be the largest meeting of its kind held so far in Western Canada.

Construction Industries Conference in Hamilton

TWO hundred general contractors, trade contractors, supply dealers and manufacturers met in Hamilton, Ont., January 17 to 20, for the fourth annual conference of the Association of Canadian Building and Construction Industries. A full report of the proceedings at the conference was published in last week's issue of "The Canadian Engineer." The above photograph was taken immediately af-

ter the presentation of the paper presented by Babson's expert on Wednesday morning, January 18. The commodity statistician of the Babson organization had just predicted that the year 1922 will probably show 50% improvement in business as compared with the year 1921, which probably accounts for the good-natured cheerfulness with which the delegates posed for this "flashlight."

SURETY COMPANIES AND CONTRACTORS' BONDS

Obligations Assumed by Surety Companies in Issuance of Bonds Relieve Contractors of Much Responsibility
—How Contract and Bid Bonds are Arranged

By W. H. Hall

General Manager, Canadian Surety Co., Toronto.

THE subject upon which I have been asked to speak, namely, that of contractors' bonds is necessarily one of interest and importance to every building contractor. Because of changed conditions it has become a more common practice in recent years to require that the contractor furnish to the obligee or proprietor, a guarantee bond to insure the performance of his contract or undertaking, in accordance with the plans and specifications, and at the price tendered for. You will be more interested of course, in the practical side of this question rather than the technical and for this reason I have chosen to deal with the former aspect of our topic.

As a preface, however, let us consider what suretyship is and also the responsibility of a surety. Suretyship is the obligation assumed by one known as a surety or guarantor to answer for the debt or default of another. It is older than written history, and suretyship obligations are found among the oldest records of antiquity. As far back as human history goes we find in civilized countries that men in positions of trust, involving the handling of property belonging to others, usually in connection with court proceedings, were required to file bonds guaranteeing that they would honestly perform their duties, and these bonds were given by friends, relatives and others. This requirement was later extended to public officials, to contractors on public construction work, and in other directions. Although the friend risked his possessions, he received no compensation, and frequently had cause to regret that he became surety. At a very early date it became apparent that such contracts must be in writing, unless the way was to be opened to permit gross frauds.

Definition of Surety Bond

What is a surety bond or guarantee bond? A surety bond is a written instrument, except in cases where a recognition in open court is required by law. It is a contract in which usually three parties are interested. The principal, which is the person, firm or corporation that enters upon an undertaking or contract; the surety, is the individual or corporation which guarantees the undertaking or contract of the principal, and the obligee, the one who relies upon the security of the instrument for faithful performance of the principal's undertaking or contract.

What are the responsibilities of a surety and why do individuals rely on the obligations of their friends? Simply as a form they say. If they believed that there was even a remote probability of being called on to pay they would not sign; they would not dare. A debt or an admitted probability of a debt of \$5,000 or \$10,000 to be incurred, without consideration, and unexpectedly, would involve so great a fluctuation and disturbance in the affairs of most men, as to preclude them from the risk; motives of ordinary prudence would prevent even the best-natured friend from becoming surety. Men take those risks because they believe them to be nil. In the great majority of cases the bondsman, if called on, is not able to pay until he rearranges his affairs. Most men have their money tied up in their business or invested in property; the friendly and forgotten bond is without provision, and sales or changes must be made to meet it. So incongruous and so repulsive does it seem that a man should be called on to sign a bond, without pay, which may result in a heavy claim against him, and to which he or his estate at the time of its maturity he is unable to respond, that it is a marvel the custom should ever have obtained, and a greater marvel that business men and courts can still be found who prefer that sort of security to the bond of a surety company. An individual bond cannot, in the very nature of the case, be as good as a corporate bond. The individual goes right on with his busi-

ness and his responsibility is subject to all ordinary mutations. He does not count the bond among his liabilities; he has no income from that class of transactions, and never expects to pay anything on them. Men do not prepare for what they do not expect. On the other hand, a surety company receives an income from the issuance of its bonds sufficient to meet all the claims arising from them; it counts each bond a liability and is compelled by law to make proper provision for it. All its assets are held, not for miscellaneous business, merchandising, speculating, etc., but for the sole purpose of protecting its written obligations. There can be no comparison between the individual and corporate bond in point of safety, convenience or propriety, and we believe that the day is not far distant, if it is not already here, when it will be regarded as outrageous, or out of the common course, to borrow a friend's name for surety purposes, as to borrow his shoes or his clothes for business uses.

Before surety companies were organized, as I have shown, persons signed bonds as sureties for their friends gratuitously, and as a matter of friendship and courtesy, and in many cases without the thought of ever being called upon to pay the obligation. This custom, until the organization of surety companies, was more or less obligatory.

Suretyship Universally Recognized as Necessary

It is noted with satisfaction that corporate or company suretyship is recognized universally as important and necessary, and that one of its chief functions is to relieve the parties between whom a contract of this nature is made, of the obligations incurred as a result of calling upon friends, relatives or business acquaintances, with possible embarrassment later. The friend is relieved of a burden that no sensible reasoning can admit he should ever be called upon to carry. The principal avoids the humiliating position of being forced to seek a surety and of placing himself under obligation in consequence of which he may later on be called upon to pay dearly for the accommodation. The obligee or proprietor is more than satisfied with a bond furnished by a surety corporation whose financial condition is under the constant inspection of the government insurance superintendent, something entirely lacking in the case of the personal surety, who might die or become bankrupt unknown to the obligee, or evade responsibility by transferring his property, or endeavor to compromise when called upon to meet his obligation.

There is a peculiarity in the surety business wherein it is different from other kinds of insurance business. In every other line of insurance the companies engaged in that insurance are the only sources from which that insurance can be obtained. There is not one of you that can insure his life except with a life office, or house against fire anywhere except in a fire insurance company. None of you can procure health or accident insurance except from a company engaged in that business, but in suretyship, if any of you has to give bond, you can go to your nearest neighbor and get that bond from him if you want to, and you might get it for nothing. Any man with a house and a piece of land, or any man with a piece of land without a house can give a bond of suretyship of almost any kind whatever. So that the competition which we have is not the competition alone with other companies engaged in the surety business, but we have the competition of personal sureties all over the country.

Contract Bonds

Coming now to the matter which is of more direct importance and interest to you, namely, that of contract bonds, let us see specifically how closely related suretyship is to the class of business in which you are engaged. If you contract to build a bridge, or to erect any kind of public structure, you must furnish a bond guaranteeing that you, or your surety in case you fail, will complete the undertaking or pay the damages. Are you about to sign a street paving contract? The law requires a bond.

If you have contracted to furnish the government, or municipality or public institutions with supplies of any

description, you will find that one of the conditions of the contract is that you must file a bond guaranteeing that you will fulfil it. No matter what your activity in this respect may be, whether it means erecting buildings, laying sidewalks, constructing roads underground or underwater work, spanning rivers, etc., the community demands that your ability, and financial strength, alone, shall not be relied upon, but back of all this must be the bond of your surety, in case you fail.

Hazard in Issuance of Contract Bonds

Experience has shown and proven that there is a very serious hazard to the surety in the issuance of contract bonds. Many contingencies entirely unforeseen and not calculated against by the contractor may arise in connection with construction work, such as, (a) unusual structural problems, (b) physical difficulties relating to surrounding property which, if damaged in any degree, may bring loss if not ruin upon the contractor, (c) unknown or undiscovered difficulties in the work itself, particularly in underwater or underground contracts, (d) changes and fluctuations in prices for materials and labor, etc.

It is therefore very necessary that the underwriter of contract bonds should possess some knowledge of contracting and engineering; especially is this true in relation to the execution of bid or proposal bonds. When we pass upon an application for a contract bond, (please mark the distinction between a bid or proposal bond and a contract bond), we have before us the copy of the contract and specifications; we know the applicant's financial ability; the experience he has had in similar work; we ascertain the amount of other contracts he has on hand to see if he is trying to do too much business on his capital (a fault not uncommon among some contractors and the cause of most of their failures), but we also have for our guidance the amounts of the proposals of other bidders for the work, and are thus able to see at a glance whether the contractor has made any serious mistake in his estimate.

Then, again, contractors are often required to bid on their own specifications and must guarantee certain results; here again a knowledge of engineering and contracting is essential to serve us in determining the desirability of the risk. When a loss arises on a contract bond, the surety has the right to finish the work itself, to engage someone else to do it on its behalf, or it may abandon the work entirely and let the obligee finish it and charge up the additional cost, if any, against the bond.

There are many and various aspects to be taken into account when dealing with a contract bond application and among others the following may be cited.

1. We must know and carefully consider the practical ability or experience of the contractor in the work which he has undertaken and proposes to perform.
2. His financial responsibility is a vital factor commensurate with the magnitude of the work which he has contracted for.
3. Whether or not he is over-trading is a serious question; that is whether the contractor has too many contracts on hand at the one time in proportion to his financial resources and practical ability.
4. How does his price compare with that of the other bidders. We have found as a general rule that a contractor whose bid is below 10% of the average of all the other bids for work is within the danger line and likely to make a loss rather than a profit on his work.
5. The specifications and contract have to be carefully perused and examined to discover onerous or unfair conditions, if any, imposed upon the contractor. Although the contractor is a party to the contract agreement and must execute same he rarely has any say as to its form, hence the urgent necessity for careful examination of its terms, in order that the interest of the contractor and his Surety may not be prejudiced. No contractor should sign a written party agreement, without perusal or examination of it, simply because it is called "The Contract." The services which the surety company can render in this regard are

valuable to the contractor and are without charge by the surety to him.

6. If the contractor should default how can his surety finish the contract or the reasonable prospect of employing others to do it at a minimum of cost and probably loss.

Bid Bonds and Marked Cheques

The general practice in Canada has been to require bidders to deposit marked cheque for a certain percentage of the amount of their proposal, usually 5% as a guarantee of good faith, the cheques of the lowest and second lowest bidders are usually being retained until the contract has been awarded and signed.

In some instances the municipality, or other body calling for tenders, has not only required the bidder to put up a marked cheque with his tender but has also required him to name, or nominate, his proposed surety, that is to say, the bidder states in his tender whom he proposes as surety for his contract bond in case he is the successful tenderer. While it is customary for a contractor to consult with his proposed surety before nominating it in this manner, it is not absolutely essential for the surety signs nothing, and is under neither moral or legal obligation to execute the contract bond.

Again, some municipalities and boards not only require the giving of a marked cheque but also exact what is known as a "Surety's Consent." This is a separate agreement in the form of tender and calls for execution by the surety and by its terms the surety is bound to execute on behalf of the tenderer whatever contract bond may be required of him if his bid be accepted.

Due to the fact that there is sometimes quite a delay between the opening of bids for any given work and the awarding of the contract, which means that the marked cheques of at least two of the bidders, if not more, are held during this period, resulting in the tying up of the funds of the contractors, or in their having to pay interest to their banks on their marked cheque, there has been more or less agitation of late against the requiring of marked cheques and allowing the substitution of bid or proposal bond as security for tenders. This practice has obtained across the border to a very large extent, it usually being optional in the United States whether a bidder shall give a marked cheque or a bid bond, such being as a definite obligation in a set sum, usually 5% of the amount of the bid, to the effect that if the proposal of the principal on the bond is accepted that he will enter into a necessary contract and give the necessary contract bond within a certain stated period. If he fails to do so the next lowest tender is accepted and the difference between the bids is charged up against the bid bond.

Surety Company Assumes Definite Obligation

In the two classes above referred to, it is to be noted that the surety assumes a definite obligation. As a matter of fact the obligation is often a more hazardous one than the execution of contract bonds themselves, for the surety has not the advantage of the comparative bids in underwriting a bid bond which it usually possesses when giving consideration to the execution of the contract bond.

Notwithstanding this, we frequently find contractors coming in at the last moment, possibly within an hour or half an hour of the time when bids are to be received, and asking that a bid bond or Surety's Consent be executed. In many cases these contractors may have been working on their bids for days if not weeks in advance, yet expect the surety company to render its decision in the matter of giving a bid bond on a few moments notice. We know the work that is to be performed, and what the contractors price is, but unless we have some familiarity with contracting we will have to depend entirely on his figures, to find, perhaps, that he has made some mistake in his estimating or omitted to include the cost of some work he is obligated to do under the contract, and that we have pledged the surety company, that its principal, the contractor will complete the work at his price, or in the event of his failure to do so, that he will pay the municipality or the obligee

on the bond— whoever it may be—the difference between the amount of his estimate, and what it actually cost to complete the work.

The surety company's application form has been arranged as a result of long experience in the business and does not contain any unnecessary query. If the interest alike of the contractor and his surety is to be preserved, and full answers given to the questions asked therein, will insure a quick decision upon the proposal. If information in regard to any question is lacking particularly in connection with the initial application from a builder or contractor, delay is thereby occasioned until particulars are forthcoming. Succeeding applications from the same contractor will probably not require that we obtain all the information necessary in the first instance.

It is therefore expedient, and indeed imperative since the interest of the contractor and his surety are so closely identified, that he should furnish to the surety company, without reservation, a full statement of all facts of which it requires to be informed, in the same way as he would do if making application to his bank for a loan or line of credit. The bond of the surety company is substantially a guarantee of a contractor's reputation, personal and practical, of his credit and also of his financial responsibility.

Consequently it is creditable to the contractor to be able to furnish a corporate surety bond and it should, and very often does, pave the way for preference, to such contractor in his particular line of work. Address delivered at the Annual Conference of the Association of Canadian Building and Construction Industries held at Hamilton, Ont., Jan. 17-20, 1922.

TO DRAFT SPECIFICATIONS FOR ALL TYPES OF ROAD MATERIALS

FOLLOWING is the report which was presented last week to the annual meeting of the Engineering Institute of Canada by the Roads and Pavements Committee, of which W. A. McLean, of Toronto, is chairman.

The year 1921 has been a season of somewhat exceptional activity with respect to road construction and paving throughout Canada; so that the chairman of this committee experienced some slight difficulty in securing the prompt attention of members of the committee whose services would be most valuable. It is anticipated, however, that with the foundation laid during the past year, very satisfactory results will accrue during the year 1922 with respect to the work carried on by this committee.

The committee has undertaken the task of preparing general specifications for various types of roads and pavements and has allocated the drafting of these specifications to various individual members as follows:

A. E. Macallum, block pavements; W. P. Brerton, sheet asphalt; J. A. Duchastel, macadam; W. P. Near, cement concrete; L. C. Charlesworth, gravel; W. A. McLean, bituminous penetration and bituminous concrete.

It is intended that the several specifications will be prepared with some degree of uniformity, based on the following outlines:

- 1—General Description.
- 2—Preparation of Subgrade. (a) Cleaning. (b) Shaping of grade. (c) Consolidating.
- 3—Foundation. (a) Brief description. (b) Dimensions. (c) Materials. (d) Method. (e) Cleaning.
- 4—Blind Course (Cushion). (a) Brief description. (b) Dimensions. (c) Materials. (d) Method..
- 5—Top course. (a) Brief description. (b) Materials. (c) Method of handling. (d) Finishing. (e) Joints.
- 6—Semi Coat (Grouting). (a) Brief description. (b) Materials. (c) Method of handling.
- 7—Shoulders. (a) Brief description. (b) Materials. (c) Method of handling.

Water-Bound Macadam—General description; preparation of subgrade; foundation; top course; shoulders.

Bituminous Macadam, Penetration—General descrip-

tion; preparation of subgrade; foundation; top course; seal coat; shoulders.

Asphaltic Concrete and Sheet Asphalt—General description; preparation of subgrade; water-bound macadam or cement concrete; binder course; top course; seal coat; shoulders.

Cement Concrete—General description; preparation of subgrade; foundation; top course; shoulders.

Brick, Stone, Wood, Asphalt Block—General description; preparation of subgrade; cement concrete; cushion; top course; grouting; shoulders.

COMMITTEES IN CHARGE OF CONSTRUCTION CONFERENCE WORK

MOST of the success of the fourth annual conference of Association of Canadian Building and Construction Industries, which was held in Hamilton, Ont., January 17 to 20, was due to the energetic work performed in committee meetings. The membership of the various conference committees was as follows, the chairman being named first in each list:

LABOR COMMITTEE—J. B. Carswell (Toronto); R. J. Fuller (Toronto); James Mackie (Winnipeg); William Wilson (Regina); J. M. Pigott (Hamilton); J. C. Harris (Halifax); S. E. Dinsmore (Windsor); E. G. M. Cape (Montreal); W. J. Crawford (St. John).

BUSINESS RELATIONS AND STANDARD PRACTICES—Geo. H. Whitlock (Moose Jaw); R. H. New (Hamilton); E. S. Mattice (Montreal); H. J. A. Bird (Moose Jaw); A. J. Bonnett (Winnipeg); A. A. McDonald (Halifax); J. F. Craik (Saskatoon); W. A. Wilson, Regina; John V. Gray (Toronto).

PUBLICITY—E. B. Osborne (Hamilton); F. A. Magee (Hamilton).

FINANCES—J. M. Pigott (Hamilton); E. G. M. Cape (Montreal); A. E. Hamilton (Moose Jaw); John V. Gray (Toronto); A. J. Bonnett (Winnipeg).

CONFERENCE ARRANGEMENTS—F. A. Magee (Hamilton); J. M. Pigott (Hamilton); John Grieve (Montreal); E. B. Osborne (Hamilton).

RESOLUTIONS AND NEW BUSINESS—J. P. Anglin (Montreal); J. M. Pigott (Hamilton); E. S. Mattice (Montreal); John Grieve (Montreal); William Wilson (Regina); Geo. H. Whitlock (Moose Jaw); James Mackie (Winnipeg); J. B. Carswell (Toronto).

PRESIDENT HARDING ENDORSES ST. LAWRENCE SCHEME

IN an address before the National Agricultural Conference at Washington, on Jan. 23, President Warren G. Harding spoke in favor of the St. Lawrence Waterway project. "I have spoken," the President said, "of the advantages which Europe enjoys because of its easy access to the sea, the cheapest and surest transportation facility. In our own country is presented one of the world's most attractive opportunities for extension of the seaways many hundreds of miles inland. The heart of the continent, with its vast resources in both agriculture and industry, would be brought in communication with all the ocean routes by the execution of the St. Lawrence waterway project. To enable ocean-going vessels to have access to all the ports of the Great Lakes would have a most stimulating effect upon the industrial life of the continent's interior. The feasibility of the project is unquestioned, and its cost, compared with some other great engineering works would be small."

The first 55,000 horse-power generator at the Queenston power house went into full commercial operation on Jan. 24. Under the agreement with the companies supplying auxiliary power to the Hydro-Electric Power Commission, a month's notice was to be given of termination of the short-term contract. This power will be discontinued on February 1.

Letter to the Editor

AERIAL PHOTOGRAPHY

Sir: In his letter on "Aerial Photography for Engineers" Canadian Engineer, Dec. 29, Mr. J. C. D. Taylor would have been on much safer ground if he had confined his remarks to the relation of aerial photographs to his own particular business, but when he attempts to show by comparison the superiority of aero-photography to topographic surveying proper, he is floundering out of his depth. In common with most exponents of the aero method he entirely ignores the simplest principles of cartographic projection, and falls into the usual error of confusing a picture with a map. They are two entirely different things. The maps he has evidently been using are reconnaissance or sketch maps which are very often misnamed "topographic" — apparently for the same reason that barber shops are sometimes entitled "Tonsorial Emporiums."

A few companies in the United States are making genuine attempts to use aerial photographs for certain classes of maps, but they are moderate in their claims and do not advertise their work as being superior to large scale topographic maps — on the contrary, they admit that aerial photos cannot take the place of accurate ground surveys.

The complicated and laborious methods of controlling an aerial survey cannot be dealt with in a short article, but with regard to the actual details, readers of "The Canadian Engineer" who are interested can test for themselves the topographical value of aerial photographs by procuring the best possible ones and examining them carefully for the following information:

The natural and artificial features of a country shown on a topographic map by means of conventional signs.

Boundaries: Provincial, county, township, parliamentary, ward, property.

Names of: Provinces, cities, towns, villages, railways, rivers, post offices, public buildings, and all features requiring names.

Roads: Sunk or raised, metalled, asphalt, paved, gravel or clay.

Culverts: Stone, cement, wood, pipe, and water level.

Bridges: Iron, steel, stone, concrete, wood, and elevation of floor above water level.

Railways: Crossings, tracks, embankments, cuttings, milestones, tanks, semaphores.

Buildings, &c.: Ground plan of houses, material (stone, brick, wood); dividing walls in blocks, outside walls, fences, palings, hedges, monuments, arched passages, sidewalks, hydrants, manholes, telephone and telegraph lines, light standards, canal locks, wharves, cranes, mooring posts, drainage openings.

Rivers: Edge of water, high water marks, direction of flow, depth, falls, rapids, fords, ferries, wells, springs.

Pasture land, meadow, orchards, scrub, bush, woods heavy or light timber or mixed).

Marsh, muskeg, bog, sand, reeds, with edges shown.

Mountains, hills, valleys, plains, rolling country. (By means of contours). Bench marks, elevations, trigonometrical stations.

Anybody having the patience to examine the photographs for the foregoing information will be very much disappointed at the results. The next list is even more disheartening because none of the topographical information required can be found on the photos. It is an extract from instructions to topographers working on the One Inch Topo. Map of Canada:

"It is important that the following be clearly shown":

Nature of woods; metalled roads; stone, brick or wood houses; sidings and railway stations; all post offices; telegraph and telephone lines — offices; all culverts over 3 ft.;

elevations of road corners, culverts and bridges; material of bridges; correct names of lakes and streams.

For those of your readers who have not the time nor opportunity to make the above tests, the subject may be simplified by giving an example free from technicalities but still adhering to the principle of the argument. A certain man requires a suit of clothes made to order but is unable to see the tailor about the matter, so he writes to the latter something like this:

Dear Sir: I require a suit of clothes by the 26th inst., but I cannot leave business at present to see you about it. I am sending you, however, a full length photograph of myself from which you will have no difficulty in figuring out the measurements, style, quality of material and amount of cloth required. Trusting to receive same by the above mentioned date. Yours truly,

If any person believes that a satisfactory suit of clothes can be obtained in this way then they must believe that an accurate map can be provided in a similar manner. We have sufficient faith in the public intelligence, however, to believe that both would be voted into the same category as absurdities.

P. J. BARRY.

Winnipeg, Man., Jan. 7, 1922.

STAFF CHANGES OF WALLACE & TIERNAN COMPANY

WALLACE & Tiernan Company Inc. announce the following changes in staff in connection with their various branches. A new office has been opened at 1046 McKnight Building, Minneapolis, Minn., in charge of B. M. Conaty, formerly of their Chicago office. This new district will cover the States of Minnesota, North Dakota, South Dakota, Montana, and the Provinces of Alberta, Saskatchewan and Manitoba.

R. B. Mowry has recently been appointed representative for the company for New Jersey, Delaware, Maryland, (Eastern Section) Districts of Columbia and Virginia and will make his headquarters at the head office at Newark, N.J.

Wallace & Tiernan, Ltd., was recently organized with headquarters at 73 Adelaide St., East, Toronto, this office being in charge of J. Van Benschoten. E. M. Lawson, formerly of the San Francisco office has been become representative at Kansas City, Mo. His district covers the States of Missouri, Colorado, Kansas, Nebraska and Wyoming.

The following additions have recently been made to the company's technical force: S. H. Gregg and G. I. Nelson who will become attached to the Chicago office; A. LoPrest, who will become attached to the San Francisco office; W. Van Benschoten who is now temporarily attached to the Chicago office; R. M. Finch who will, for the present, make the head office at Newark, New Jersey, his headquarters. L. H. Goebel has become Manager of Industrial Sales and R. V. Donnelly manager of Sanitary Sales, both making their headquarters at the main office of the company at Newark, N.J.

THE PACIFIC COAST PIPE COMPANY OF VANCOUVER have just issued their general catalogue which is a very useful and interesting compilation of facts calculated to be of practical value to all those who are concerned with the design, construction and operation of waterworks and hydro electric power plants, etc. It places before engineers, contractors and waterworks men the merits of wood pipe in this connection and in addition includes some very useful tables together with a great many illustrations showing the various uses to which wood stave pipe can be successfully put. This history of the uses of wood pipe is interestingly presented and altogether hydraulic engineers will find in this the newest publication of the Pacific Coast Pipe Company a great deal of useful information. H. C. James, manager of the company, is to be congratulated upon this latest piece of trade literature. The catalogue contains fifty 6 x 9 pages and will be gladly sent to all who apply for a copy.

RIVAL ST. LAWRENCE WATERWAY PROJECTS

NOW that the report of the International Joint Commission on the St. Lawrence waterway has been referred to the Interstate Commerce Committee of the United States Congress, it is to be expected that a vigorous discussion of the whole proposal will shortly occupy the public attention. Ample stimulus for this will no doubt arise from the objections of New York City and State, as well as from Montreal and such Eastern interests as fear for their existing commercial advantage.

While most of the discussion will probably concern the broad economic features of the situation and the effect upon the commerce of the two countries concerned, there will no doubt be a good deal of attention given by technical men to the engineering features of the various schemes of development proposed. By reason of the great magnitude of the undertaking and because private interests have been concerned with it chiefly because of the power that would be made available, fewer alternative proposals for development were received by the International Joint Commission than might have been expected. Those laid before the commission were submitted by, or on behalf of, the Hydro-Electric Power Commission of Ontario, the New York and Ontario Power Co., Hugh L. Cooper & Co., and E. S. M. Lovelace, of Montreal. Another proposal, outlined elsewhere in this issue, has been put forward by the Great Lakes and Atlantic Canal and Power Co., Ltd.

Extensive reference has already been made in our columns to the proposals of the Hydro-Electric Power Commission with respect to the development of the international section. While several alternative schemes were studied, the one which appears to be generally regarded with most interest, possibly through contrast, is scheme B, which provides for a double-stage development giving an

estimated continuous power output of 1,000,000 h.p. at a cost of \$96 per h.p. or if provision for navigation be included in the power cost, at a cost of \$132 per h.p., including interest during construction. An advantage of this development, as against a single-stage one such as the Hydro scheme A, or that proposed by the government engineers, is, as stated by the proposers, a reduction of the area flooded from 29,000 to 6,000 acres.

Criticism of the Hydro proposals has been made on the ground that the estimates of cost are inaccurate, that the amount of power available is overstated and that no special arrangements have been provided whereby the liability to obstruction of the river by ice jams above Cornwall is overcome. It is stated that the attempt to maintain open water in the reaches between the Galops Rapids and Cornwall might reduce the head at peak in winter from about 70 ft. to under 50 ft. during the existence of an ice jam.

While important differences in estimated costs are to be expected where quantities are necessarily based on preliminary investigations, it is understood that the unit prices assumed by the Hydro were the same as used by the Engineering Board, except in the case of earth excavation within cofferdams, which was higher. Differences of opinion appear to exist concerning the possibility or desirability of attempting to maintain an ice cover in the power reach above Cornwall. Scheme A of the Hydro would be as conducive to the formation of an ice cover as the Wooten-Bowden one, whereas scheme B would be only a little less so, or on the basis of relative areas of open water still remaining in the pools above the dams and power houses, as 11.8 square miles to 9.2. It is doubtful whether with the velocities that will exist above the Barnhart Island plant according to one of the schemes, the maintenance of a very large ice cover is possible, and whether in view of the experiences of the Cedar Rapids Power Co. in preserving an open channel it is desirable to embark on such an undertaking. Apparently, a good deal of further study is necessary with respect to the matter of obstruction, for although the Engineering Board of the International Joint Commission counted upon operating under an ice cover in the power reach above the Long Sault Rapids, the commission in reporting is strongly of the opinion that the ice problem should be gone into very thoroughly by the enlarged engineering board which it recommends.

Rather a large disparity seems to exist between the estimated costs under the Hydro schemes and the scheme of the Engineering Board. Counting provision for 25-ft. navigation with allowance for 30 ft. in the locks, the cost of the Hydro scheme A per h.p. is \$132 and the latter \$109. To render these figures comparable, there should be added to the estimate of the Engineering Board about \$16 per h.p. to allow for interest during construction, bringing it up to \$125 per h.p.

The New York and Ontario Power Co. has proposed a double development scheme which was described in detail in our issue of January 17, with dams at the foot of the Rapide Plat and at the Long Sault Rapids. In accordance with this scheme, which somewhat resembles the Hydro scheme B, it is estimated that 1,655,000 h.p. might be developed and provision for improved navigation be made at a cost of \$87 per h.p. Doubt is expressed by the company concerning the feasibility of maintaining a stable ice cover under the proposed single development scheme of the Engineering Board between the Galops Rapids and Cornwall. Based upon the experience of the company along the river, it expressed the view that it would be better to attempt to maintain an open channel particularly in the lower reaches, and in this view it appears to support the Hydro-Electric Power Commission. The considerably lower cost per unit of power developed is said to arise in part from a somewhat cheaper standard of construction proposed for power houses.

While the above two alternative schemes concern only the international section of the river, that put forward by Hugh L. Cooper & Co. has to do with the entire improvement from Lake Ontario to Montreal. The company estimates that about 1,000,000 h.p. might be developed at its

badly-located Cat Island plant at a cost of about \$200 per h.p. and that 6,625,000 h.p. might be developed along the entire 182 miles at a cost of \$219 per h.p., including necessary provision for deep water navigation.

The proposals of Mr. Lovelace concern chiefly that portion of the river between Montreal and Lake St. Louis. No comprehensive scheme was put forward by him for the undertaking as a whole.

According to the views put forward by Charles P. Loveland, President of the Great Lakes and Atlantic Canal and Power Co., Ltd., the development of the international section would become chiefly a means of providing cheap power for those who have been agitating for hydro-electric power from the Long Sault, and if once the government committed itself to the improvement of this section, the navigation improvements below Lake St. Francis might be deferred many years. This company advocates in addition to certain works below Montreal, a navigation and power canal from Lake St. Francis to Chambly with connection to Montreal harbor providing for power development at several locations between Melocheville and Laprairie. It urges that the only joint construction work undertaken by the two governments be two regulating dams, one at the Long Sault and the other above Iroquois for the purpose of dividing the flow of the river into two equal parts, so that each nation may then exercise absolute authority over the works required on its own side of the river. In this it does not appear to be at variance with the International Joint Commission, which recommends a very similar procedure.

Some of the views expressed by Mr. Loveland will no doubt be challenged by those who favor a development such as that proposed by the Engineering Board and by several others who have submitted alternative schemes. It can scarcely be said that the United States is asked to contribute to improvement of navigation in Canada any more than Canada is being asked to contribute to similar improvements in American waters, nor can the enterprise be attacked on the ground that Canada should not enter it, since American citizens may secure the major portion of the benefit to be derived for some years to come. The report of the International Joint Commission clearly recommends that the expense as far as navigation is concerned, be met in proportion to the benefits derived, and that power works be built, installed and operated at the expense of the country in which they are located.

In such discussions as occur on the engineering features of this great undertaking, it should be remembered that proposals so far put forward have of necessity been based upon a somewhat hurried study of the situation. The twelve months allotted to the Engineering Board made it quite impossible to design the required works in detail or estimate costs in any other manner than by a block system. The same is no doubt true of the estimates made by those who submitted alternative proposals. While there is some discrepancy in the costs of the work in the international section as estimated by the several groups of engineers that have studied the development of this section, it appears that the work involved would not impose an undue burden upon the people of either this country or the United States, even assuming it were not revenue producing. When the revenue from the sale of power is considered, it is seen that at any reasonable cost the development of the waterway would be an economically practicable one.

STRESS DETERMINATION BY POLARIZED LIGHT

AT THE recent meeting of the American Association for the Advancement of Science in Toronto, Dr. Paul Heymans showed in a very striking manner the possibilities of secondary stress determination in complicated structures by the use of polarized light. Until now it has been necessary to attack a problem of this sort with very unwieldy tools, so that the detailed analysis of such stresses in complicated structures has been a labor to be dreaded by engineers. It now appears, however, that by working with models constructed with a transparent substance having satisfactory

optical properties, the distribution of stresses can be strikingly shown by the graduations of color recorded on a photographic plate. By purely optical means, the difference in principal stresses in the specimen may be determined, and the sum of the principal stresses having been found by measurement of the lateral strain, it thus becomes possible to fix the value of the principal stresses and hence the stress in any direction. From certain photographs exhibited by Dr. Heymans, it appears that we may look forward with some confidence to the determination of secondary stresses at rigid joints of a truss by means of polarized light studies. So promising is this field, that every encouragement should be given to research work in it.

PERSONALS

J. W. SMART has been elected president of the Manitoba Association of Architects.

CONTROLLER W. W. HILTZ, of Toronto, has been appointed the representative of the city of Toronto on the Town Planning Association.

BERT DOERR, Kitchener, has been appointed superintendent of the Galt local Hydro Commission and will enter upon his duties Feb. 1st.

C. E. FRASER has been appointed road superintendent for Scarborough Township. It is understood that the new township council is planning extensive road improvements during the coming season.

ALFRED DRYLAND, M. Inst. C.E., County Engineer of Middlesex, England, who paid an extended visit to Canada and the United States last fall wrote recently to "The Canadian Engineer" saying that he has over \$10,000,000 of road and bridge work on hand at the present time.

J. EMILE VANIER, civil engineer, of Montreal, has just returned from Europe where he spent two months visiting various countries for the purpose of ascertaining what European Governments were doing along the line of furnishing farmers with limestone dust for fertilizing purposes. Upon investigation he found that in Europe much more interest is taken in this matter than in Canada. Mr. Vanier is preparing a report on the subject to submit to the Quebec Provincial Government.

J. B. CARSWELL who was recently elected to the Presidency of the Association of the Canadian Building and Construction Industries received his training as civil engineer at Glasgow (Scotland) University of which institution he is a graduate. He came to Canada twelve years ago and engaged in general contracting work in Montreal. He later changed to the engineering staff of the Grand Trunk Railway, following which he represented the firm of Ross, MacDonald and Co. in Ontario for a period of five years. During this period Mr. Carswell had under his charge the erection of the Royal Bank Building, the Central Technical School, the new Union Station, etc. At the outbreak of war he became chief engineer of the Aviation department of the Imperial Munitions Board. While with the Board he built all the flying camps in Can-

ada using his own designing and construction staff. The Carswell Construction Company of Toronto of which Mr. Carswell is president is well known in all parts of this country.

JOHN G. SULLIVAN, consulting engineer, Winnipeg, Man., was elected president of the Engineering Institute of Canada at the annual meeting in Montreal last week. Mr. Sullivan was born at Bushnell's Basin, Munroe Co., New York, on January 11, 1863. He was educated at Cornell University, graduating 1888. His first railroad

experience was with the Great Northern Railway, as rodman, later becoming assistant engineer of that road. In 1893 he became assistant engineer of the Alberta Railway & Coal Co.; locating engineer of the Butte Anaconda and Pacific Ry. 1894; principal engineer Kalso and Slocan Ry. in 1895; reconnaissance engineer Columbia & Western Ry. in 1896, and in 1898 was appointed assistant engineer of this road. In 1899 Mr. Sullivan joined

the engineering staff of Canadian Pacific Railway, being appointed divisional engineer of construction, which position he held until 1905 when he became assistant chief engineer of the Panama Canal. In 1907 Mr. Sullivan returned to the C.P.R. as manager of construction, Eastern lines and in 1908 was appointed assistant chief engineer, at Montreal, holding this position until 1911, when he became chief engineer of Western lines. In 1915 he was appointed chief engineer of the C.P.R., which position he held until his resignation in 1918. Mr. Sullivan is a prominent member of the American Railway Engineering Association. He was chairman of Committee No. 16 Economics of Railway Location and was president of the Association in 1918. Mr. Sullivan is a member of the American Society of Civil Engineers, and has been a member of the Engineering Institute of Canada since 1900.

OBITUARY

ANTON BERG, Toronto, who was a well known inventor of brick making machinery, died last week in his 65th year.

WILL HOLD BUILDING TRADES EXHIBITION IN MONTREAL

AT THE annual meeting of the Builders' Exchange held in Montreal on January 23, a plea was made for the general support and participation by members of the Building Trades in Montreal, in a Building Trades Exhibition, to be held in the Dubrule Building, Phillips Place, on April 1 to 8, inclusive.

The purpose of the exhibition is to awaken prospective builders to the fact that the coming months will be the right time to build, and with this end in view the slogan: "If you are going to build, build now," was adopted as the most suitable to arouse public interest in the project. Mr. Harry Gustin and Lt.-Col. K. C. H. Monks addressed the meeting at length on the benefits to both the builders and the public to be gained by making the exhibition a success.

About 120 members of the Builders' Exchange were present at the annual meeting and at the dinner which preceded it. Before the commencement of business Col. E. G. M. Cape, gave a report of the proceedings at the conference of members of the Association of Canadian Building and Construction Industries held recently in Hamilton. There was a general feeling at the conference, said Col. Cape, that building costs were going no lower. There was a shortage

of building all over the country, and also a very small surplus of building materials, and it was believed that any considerable demand would be likely to keep up the cost of materials.

D. K. Trotter, general secretary, presented the annual report of the secretary-treasurer. This showed total receipts of \$5,473.60, which included the sum of \$299.60 carried forward from 1920, and disbursements during the past year of \$5,470.33. This left a net bank balance of \$3.27.

The officers elected for 1922 were: K. D. Church, president; Douglas Bremner, first vice-president; H. Vincent, second vice-president; A. T. Alexander third vice-president; Alphonse Gratton, fourth vice-president; J. E. Walsh, honorary treasurer; A. Plomondon, honorary secretary. The other directors elected were John Quinlan, E. B. Evans, D. A. Bethune, J. W. Graham, A. W. Bremner, J. D. Johnson, T. Latourelle and A. Leclaire.

MANITOBA ASSOCIATION OF ARCHITECTS ANNUAL MEETING

AT the annual meeting of the Manitoba Association of Architects held last week, J. W. Smart was elected President, G. W. Northwood, vice-president, with the following members of the Council, C. S. Bridgman, C. C. Chisholm, Chivers J. Halley, E. Proin, D. A. Ross and J. M. Semens, Secretary-Treasurer, E. Fitz Munn.

At the meeting it was announced that the Royal Architectural Institute of Canada had expressed a desire to hold its 1922 convention in Winnipeg and a cordial invitation was extended to have them do so.

A resolution was passed commending the action of the Provincial Government in appointing a town planning controller and in putting into operation the town planning act.

POWER LINE FROM NIAGARA TO MONTREAL

AN interesting address was delivered by T. N. Hogg, of the engineering staff Ontario Hydro-Electric Commission on Jan. 27 before the Hamilton Branch of the Engineering Institute of Canada on "St. Lawrence River Power Development." Mr. Hogg predicted that in time a power line would loop Lake Ontario from Niagara Falls to Montreal, the power lines of the St. Lawrence, Trent Valley and Niagara Falls being linked in one great trunk line, from which secondary lines would be served. Since 1905, by the development of Hydro power, a demand for half a million horsepower had been created. The speaker dwelt on the feasibility of the plan and stated that by harnessing the St. Lawrence 35 million tons of coal would be saved yearly by steam power plants. The speaker illustrated his remarks with lantern slides.

In connection with the much discussed question of the electrification of a number of branch railways in Ontario, some interesting conclusions are set forth in the report of the International Joint Commission. The report states that in the zone considered from Lake Erie to the Quebec boundary there are 36,000 miles of railway on both sides of the line. Of these railway lines, 19,000 miles could be electrified profitably. The report says the saving in coal by such an electrification would be 8,890,200 tons annually. These 19,000 miles of railway would cost \$560,000,000, based on costs of 1919, but the annual saving would be \$81,000,000, or 14.2 per cent. on the investment. It is added in the report that the cost today would be nearer \$400,000,000 than \$570,000,000. Whether Canada and the United States are prepared to go ahead with the immense St. Lawrence scheme or not, the figures and comparisons gathered by experts are illuminating in these days of Government economy. To show what coal costs railways in this country, only two years need be cited. In 1919 the Canadian Government C.N.R. lines spent \$2,800,383 for coal; in 1920 the bill was \$3,066,344. In 1916 the average price was \$3.65 a ton, while in 1920 the average price was \$7.40 a ton.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

Construction news items, including notes of various tenders called, are published on pages 44 to 50 of this issue. The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported on the above-mentioned pages. The word "Issue" refers to the issue of "The Canadian Engineer" in which there appeared a notice giving some details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Toronto, Ont., office building, Toronto Hydro-Electric System	Feb. 1	Jan. 24
Windsor, Ont., one motor-driven street flusher	Feb. 7	Jan. 24
Quebec, Province of, construction of gravelling in parish of Ste. Rose du Degele	Feb. 9	Jan. 24
Ontario, Province of, Work on Provincial highway, Township of Ameliasburg ..	Feb. 10	Jan. 17
Victoria, B.C., fabrication and erection of part of the superstructure of Johnson Street bridge	Feb. 13	Jan. 17
Ontario, Province of, supply of Portland cement	Feb. 14	Jan. 24

BRIDGES, ROADS AND STREETS

Birch Cliff, Ont.—It is understood that Scarboro Township Council is planning extensive road improvements, but that the year's road program has not yet been mapped out. Road Superintendent, C. E. Fraser.

Bramford, Ont.—The City Council gave the \$40,000 debenture by-law for the completion of St. Paul's Ave. subway its third reading.

Brantford, Ont.—Estimates for an expenditure of \$62,000 on the suburban section of the Brant County road system will be submitted to the council by the chairman of the Suburban Roads Commission.

Brantford, Ont.—Woodhouse Township, Norfolk County, has asked Brant County Council for aid in presenting the claim for a provincial highway from Port Dover to Guelph. Brant Chamber of Commerce obtained indorsement of the Western Ontario United Boards of Trade at Woodstock recently to a resolution along this line.

Chatham, Ont.—Judging by the way deputations have been appearing before the Kent County Council this session, the good roads movement is still a popular one. On Jan. 26 no fewer than three waited on the Council from various parts of the county urging the construction of permanent roads.

Galt, Ont.—At a recent meeting of the Suburban Road Commission estimates amounting to \$22,500 were prepared for this year's work. This money will be expended in construction work on: No. 12, Blair road; No. 31, Roseville road; No. 33, Sprague's road; No. 35, East River road; No. 37, Toll Gate east; No. 76, Hespeler, Provincial-County between North Dumfries and Waterloo; with a sum for coating some parts of the system with tarvia.

Kingston, Ont.—The Frontenac County Council has decided that during this year the sum of \$109,700 would be expended on its roads. Besides this amount \$16,000 will be expended upon the Kingston suburban area, of which the city of Kingston pays one-half.

Montreal, Que.—Five tenders were received by the Executive Committee for the furnishing of 40,000 ft. of

straight limestone prepared for curbing, and of 5,000 ft. of circular. The highest tender for the former was received from Joseph Brien, at \$1.90 per ft., and the lowest from Georges Labelle, at 95c per ft. For the circular stone, Joseph Brien was again the highest tenderer at \$2.15 per ft. and G. Labelle the lowest at \$1.10. Two tenders were received for granite, Joseph Brunet being prepared to supply 20,000 ft. of straight and 5,000 of circular at \$2.25 and \$3.00 respectively, while the Morrison Quarry Co. can supply the same for \$2.00 and \$2.75, respectively.

Ottawa, Ont.—The Board of Control decided to proceed with the grading of Byron, Java Iona, Parady, Geneva and Clarendon Streets, at a cost of approximately \$12,000.

Ottawa, Ont.—The Suburban Road Commission plans the following work for this year: The rebuilding of the Russell Road for several miles, the extension of the Richmond Road, and some work on the Metcalfe Road. Chairman, John Bingham.

Paris, Ont.—The final plans for the proposed new highway are nearly completed. Clerk, C. B. Barker.

Paris, Ont.—Final plans for the construction of a highway through Paris are under way and work will start in the near future. About 150 men will be employed.

Peterboro, Ont.—City Engineer R. H. Parsons was instructed by the Board of Works to obtain prices on road oil.

Quebec, Province of.—Hon. J. L. Perron, Minister of Highways, informed a delegation from Lotbiniere that work would be resumed in the spring on the Lotbiniere section of the Levis-St. Lambert highway. The work in this section will cover 30 miles.

Quebec, Que.—Hon. J. L. Perron, Minister of Roads, has announced that \$5,000,000 will be expended on new road construction this year, and \$2,500,000 for repairs and maintenance. A new road will be constructed from St. Lambert of St. Hyacinthe, via the Cote Noire Road to the Salaberry monument at Chambly Basin.

Sarnia, Ont.—At the request of the ratepayers of Somers Township, the County Council has decided to build one and three-quarter miles of permanent concrete road on the 16th sideroad to link up with a permanent highway in Kent County.

Todmorden, Ont.—The proposed Todmorden-Leaside bridge was discussed at a recent meeting of the ratepayers. Frank Barber, Engineer, submitted estimates and told how the cost would be met. A committee was formed to interview Leaside ratepayers and the Danforth Business Men's Association with a view to getting their co-operation.

Toronto, Ont.—The City Council referred back for further consideration the proposed widening of Yonge St. from Lawton Ave. to the C.P.R. tracks.

Toronto, Ont.—The City Council gave two readings to the by-law for the extension of Dundas St. across Yonge St. to a point just east of Victoria St.

Toronto, Ont.—Mount Pleasant Ratepayers' Association passed a resolution that deputation should wait on the Board of Control to ask that the Avoca Vale bridge in Moore Park be built at once.

Toronto, Ont.—The City Council intends to construct asphalt pavements on Avenue Road, Gloucester St., Grange Road, John St., Pembroke St., and St. Clair Ave., at an estimated cost of \$227,305. Also a concrete sidewalk on Windermere Ave., at a cost of \$305.

Toronto, Ont.—The proposition of a bridge to extend from the head of Pape Ave. to make connection with the town of Leaside, came before the York County Council at a recent meeting, and the matter was referred to the Warden

and commissioners for report at the June session of the Council.

Toronto, Ont.—Works Commissioner R. C. Harris reported to the Board of Control that he had received a communication from Chief Engineer F. A. Gaby, of the Hydro-Electric Power Commission of Ontario, directing attention to the possibility of the construction of a subway for street cars at Bay St. in the near future.

Toronto, Ont.—Reeve William Keith and J. M. Guardhouse, members of the Toronto and York Roads Commission, submitted to the York County Council a program of road construction involving an expenditure of over \$800,000, including the following: Paving Yonge St. through Richmond Hill after the tracks are moved to the centre of the roadway, \$16,500; widening bridges in Aurora, \$7,000; widening and resurfacing Kennedy road at Unionville, \$58,000; two miles waterbound macadam pavement on Kennedy road north from Casnel, \$33,000; $\frac{1}{2}$ -mile waterbound macadam east of Stouffville, \$12,000; diversion through Ballantrae swamp, \$11,000; grading and gravelling 5th concession, Witechurch, \$4,000; Dundas street culverts, \$800; widening and resurfacing Vaughan road in York township, \$31,900; extending waterbound macadam on Vaughan road in Vaughan, \$38,000; paving stretch of Weston road after tracks moved to centre of street, through Mount Dennis, \$23,000; waterbound macadam from Kleinburg north on Weston road, \$38,000; widening and resurfacing Don Mills road from Pape avenue to Taylor's Hill, \$19,400; extending waterbound macadam on Don Mills road, \$24,000; two miles waterbound macadam, Malton road, \$48,000; Malton road, Eagle street to the Humber, \$8,500; King road, $\frac{1}{2}$ -mile north from King City, waterbound macadam, \$10,960; $3\frac{1}{2}$ miles of concrete pavement on Sutton road from Keswick, \$120,000; waterbound macadam two miles north from Sharon, \$42,000; Mount Albert bridge, \$8,000; Lloydtown road, west of Aurora, two miles waterbound macadam, \$38,000; two miles gravel from Kettleby west, \$8,000; Vandorf road, Wellington street, Aurora, widening and surfacing, \$23,000; York road, Lansing to Oriole, concrete base, hot top, \$40,000; O'Sullivan's corners, one mile west, waterbound macadam, \$22,000; bridge east of Agincourt, \$10,000; Brown's road two miles waterbound macadam, \$42,000; Scarlett road, St. Clair avenue, north $\frac{1}{2}$ -mile, \$15,000.

Winnipeg, Man.—The City Council intends to extend Wolever Ave., from Erin St. to Clifton St., at a cost of \$2,275. City Clerk, C. J. Brown.

WATER, SEWAGE AND REFUSE

Brantford, Ont.—The Board of Works recommended that the offer of Canada Lock-Joint Pipe, Ltd., for the supply of reinforced concrete pipe to be used in the construction of the Mohawk St. outfall sewer, be accepted at the following prices: 36-in. pipe, \$4 per ft.; 42-in. pipe, \$4.75 per ft.

Eastview, Ont.—The Town Council intends to construct a sewer on the Montreal Road, Dora St., Main St., King St., and John St., at an estimated cost of \$70,500. Town Clerk, Joseph Emond.

Port William, Ont.—The City Council will consider two schemes for the construction of a sewer to serve the proposed Wayland school. One scheme for permanent work calls for an expenditure of \$25,000, and the other for temporary connection, costing \$2,000. City Engineer, C. B. Symes.

Kitchener, Ont.—Plans have been completed for the proposed new water works plant to be installed by the Water Commission, and work will commence early in the spring. Superintendent, M. Pequegnat.

Kitchener, Ont.—The Horton Steel Works, Ltd., Bridgeburg, Ont., have been awarded a contract by the City Council for the construction and erection of a standpipe having a capacity of a million Imperial gallons, to be used in connection with the city's water works system. This tank will be 94 ft. in diameter by 23 ft. 3 in. high. The city also considered the advisability of installing a concrete

tank, but after going into the matter carefully, decided on a steel tank as being the best installation.

Midland, Ont.—The Town Council is considering the construction of a sewer on Dominion Ave. at a cost of \$1,600. Clerk, C. E. Smith.

Oil City, Ont.—The Canadian Oil Companies, Ltd., are planning to erect a filtering plant at a cost of \$25,000. The contract for the supply of brick has already been let to Fred Howlett & Sons.

Port Credit, Ont.—Preliminary work for the new water works system will be rushed through in order that active work may be commenced in the early spring. The whole system is estimated to cost \$110,000—\$60,000 for the central plant and \$50,000 for the distribution system.

Prince Rupert, B.C.—The City Council plans the construction of an incinerator early this year. Estimated cost, \$15,000. City Engineer, F. G. Whittaker.

Smith's Falls, Ont.—The Provincial Board of Health has served notice on the town that it must reach a definite decision before February 1 regarding the installation of a filtration plant for its water supply, or suffer the penalty imposed by law. The water supply is now secured from the Rideau river.

Todmorden, Ont.—The proposed improvement of sewers was discussed at a recent meeting of the ratepayers. R. O. Wynne-Roberts, Engineer, outlined a scheme which would cost approximately \$900,000, but stated that for present needs only a small portion of the system, costing about \$90,000, would be necessary.

Toronto, Ont.—City Council referred back a motion by Ald. Baker that the East Toronto water works plant, which is used as a steam reserve, be electrified.

Toronto, Ont.—Works Commissioner Harris will shortly present to the Works Committee a general plan for the construction of a sewage system for the whole of North Toronto.

Toronto, Ont.—The City Council intends to construct water mains on Bedford Park Ave., Brookdale Ave., Cranbrook Ave., Deloraine Ave., Indian Grove, and Lawrence Ave. West, at a cost of \$18,469.41.

Toronto, Ont.—Works Commissioner Harris has recommended the construction of water mains on the following streets: Melrose Ave., Small St., Willard Ave., and Woodbine Ave. Total estimated cost, \$5,870.78.

Toronto, Ont.—The Chartered Trust Co. applied to the Board of Control for a sewerage system for the new subdivision in the Leslie Nurseries property on Queen St. East, at a cost of \$84,000. The Board recommended that the system be installed.

Weston, Ont.—Plans for repairing and extending the water system were presented to the Town Council by members of the Water, Power and Light Commission. The commission proposes to line the reservoirs with concrete, and generally bring the system up to date. The cost is estimated at \$17,000.

Windsor, Ont.—The Essex Border Utilities will make another attempt to meet the Windsor Water Board and the Walkerville Water Co. The plan, it was explained at a meeting of the Commission, will not interfere with the distribution plants at Windsor and Walkerville. Each of the interested municipalities will have sole control of distribution, with the Commission in charge of delivery from the filtration station.

Winnipeg, Man.—The City Council intends to construct a sewer in Beach Ave., from the C.P.R. to Kent St., at a cost of \$1,627. City Clerk, C. J. Brown.

York Twp., Ont.—The contract for the construction of 6-in. watermains on Alleen Ave., Connor Ave., Doncaster Ave. and Rosevear Ave. has been let to Gordon Thompson, 57 Howard Park Ave., Toronto.

LIGHT, HEAT AND POWER

Brantford, Ont.—C. E. Kirkby, superintendent of the Brantford township Hydro system, announced that work on the Tutela Heights Hydro line will start immediately.

Courtright, Ont.—On February 6 a by-law will be voted

on by the ratepayers to authorize the borrowing of \$11,500 for the purchase and installation of Hydro-electric equipment. Clerk, R. G. Stewart.

Sturgeon Falls, Ont.—The Northern Ontario Light and Power Co. is considering the purchase of the power rights held by the McIntyre-Porcupine Mines on the Sturgeon Falls, Mattagami River. If the deal goes through and McIntyre assigns its power license at Sturgeon Falls to the power company, there will be available for development and for supply to the Porcupine mining district, an additional 7,000 h.p.

Toronto, Ont.—City Architect Price submitted three separate propositions to the Board of Control for the heating of the Live Stock Arena at the Exhibition Grounds. Two of them were elaborate, involving expenditures of from \$100,000 to \$130,000. The other, and probably the one that will be adopted, provides for an addition to the present temporary heating plant at a cost of \$7,000. Action was deferred.

Winnipeg, Man.—The contract for the supply of 2,000 ft. of 13,000-volt and 2,000 ft. of 2,300-volt cambric insulated fireproof braided cable, has been let to the Canadian General Electric Co., Ltd., at \$3,795, f.o.b. Winnipeg.

RAILWAYS

Birch Cliff, Ont.—The Toronto and Eastern radial by-law was given its third reading by the Scarboro Township Council. Scarboro's share of the bonds for its construction will be given to the Hydro-Electric Power Commission of Ontario with authority to proceed with the construction of the road, either with or without the consent of the Government.

Brantford, Ont.—The City Council approved the \$80,000 by-law for the extension of the street railway.

Guelph, Ont.—The Grand Trunk Railway Co. plans track alterations in this city.

Kitchener, Ont.—At a public meeting held in the City Hall a committee headed by Geo Lippert, was appointed to work in conjunction with the Railway Committee of the City Council to consider protection of all railway crossings, including a subway at King St.

London, Ont.—The London & Port Stanley Railway Commission has empowered Sir Adam Beck, the chairman, to enter into negotiations with the Grand Trunk Railway for the taking over by the L. & P. S. R. of a building owned by the Grand Trunk Railway, at the northeast corner of Richmond and Bathurst Streets for the purpose of converting it into a depot for the city's railway, at a cost of \$20,000.

Uxbridge, Ont.—Henry Strang, of Hensall, Ont., Township Clerk, has been instructed by the Township Council to ascertain from the Hydro-Electric Power Commission of Ontario the steps necessary to insure a hydro radial from St. Mary's via Kirkton and Exeter to link up with the proposed electrified Huron and Bruce Railway, ultimately extending to Grand Bend via Dashwood.

Toronto, Ont.—The City Council gave third reading to the Toronto Suburban Railway purchase by-law.

FACTORIES AND LARGE BUILDINGS

Bridgeburg, Ont.—At a recent public meeting of School Section No. 6 of the adjacent township of Bertie, it was decided to co-operate with School Sections Nos. 2, 4 and 10 in order to secure for the township immediately surrounding Bridgeburg and Fort Erie a consolidated school.

Chatham, Ont.—The Separate School Board have decided to proceed at once with the construction of a new separate school in North Chatham. Some time ago the Halliday property on Victoria Avenue was purchased for \$12,000.

Copper Cliff, Ont.—The public school which was valued at \$100,000 was recently destroyed by fire. The school will be rebuilt at once. Secretary of School Board, Mr. Gallagher.

Crediton, Ont.—The members of the Methodist Church have decided to rebuild at once the church recently destroyed by fire. Plans will be prepared by Architect J. Vicar Munro, of London.

Clover Bar, Alta.—A movement is on foot here for the erection of a church. Address R. P. Ottewell.

East Toronto, Ont.—The Y.M.C.A. plan the erection of a new building on Gerrard St. next summer.

East Toronto, Ont.—The Grand Trunk Railway plan the erection of a Railway Y.M.C.A. building on a site near Kimberley Ave. The work will be commenced in the spring; also the erection of a new freight shed and railway passenger station.

Glanworth, Ont.—Plans for a library building have been prepared by William Murray, Architect, London, Ont.

Kitchener, Ont.—Fire damaged the Weber Chambers to the extent of \$15,000.

Kingston, Ont.—The Provincial Department of Agriculture is being urged to rebuild at once the Eastern Ontario Dairy School, recently destroyed by fire.

London, Ont.—Hyatt Bros. have the contract for rebuilding the cigar factory of William Ward & Sons, Ltd., which was recently damaged by fire to the extent of \$40,000.

London, Ont.—This city plans to spend about four million dollars on schools this year, according to the extensive program of building outlined by the Board of Education. An addition to the London Technical and Arts Schools is estimated at \$1,000,000, while the program provides for erection of new buildings to cost \$400,000, including a new 14-roomed school in West London, and the first unit of a 17-roomed school in East London.

Lunenburg, N.S.—Fire destroyed the storehouse of Adams & Knickie.

Melbourne, Ont.—The Public and Continuation School was destroyed by fire.

Mitchell, Ont.—A one-storey addition is to be erected in the rear of the main factory of the Wettlaufer foundry.

Montreal, Que.—The Vimy and Harvard Apartments, 5618-26 Sherbrooke St., valued at \$250,000, were destroyed by fire.

Montreal, Que.—The construction of an ice arena on the corner of St. Luke and Atwater Streets will commence early in April. Estimated cost, \$400,000.

Newmarket, Ont.—The Agricultural Society plans the erection of a new poultry building. President, W. H. Eves.

Ottawa, Ont.—A movement is on foot for the erection of a Community Hall.

Ottawa, Ont.—The Butterworth Building, 197 Sparks St., was damaged by fire to the extent of \$12,800.

Paris, Ont.—A three-storey building will shortly be erected on Grand River St. by Daniel McTavish.

Port Arthur, Ont.—Work on the erection of their new paper mills will be commenced here shortly by the Provincial paper Mills, Ltd. The building will be 900 ft. long and will cost with the equipment about \$1,000,000.

Port Credit, Ont.—The School Board authorized the preparation of plans for an addition to the Forest Avenue School. Chairman, Mr. Maybee.

Quebec, Que.—The sub-committee of the Catholic School Commission decided to ask for plans for the reconstruction of the Sacred Heart School on Grant St., which was destroyed by fire. Estimated cost, \$40,000.

Regina, Sask.—Plans for the construction of a public comfort station have been prepared by Storey and Van Egmond, architects. Estimated cost, \$25,000. Tenders will probably be called for about March 1.

Sarnia, Ont.—West Lambton Fair Board will consider the erection of a poultry and horticultural building. President, C. A. McArthur.

Silverthorne, Ont.—The trustees of S. S. No. 35 will ask the ratepayers to ratify the proposition to raise \$161,000 for a new school, together with the site. The cost of the school when completed would be about \$200,000.

Thorold, Ont.—A committee of the Board of Trade has been formed to negotiate with the Government for a new post office.

Toronto, Ont.—A. Stolberg plans to erect a factory on the north-east corner of Keating St. and Carlaw Ave.

Toronto, Ont.—The members of Hillcrest Church of Christ plan the erection of a new church at a cost of \$50,000.

Toronto, Ont.—The Chartered Trust Co. proposes to start work at once on 50 of 200 houses which they propose to build on Queen St. East.

Toronto, Ont.—The members of Oakwood Presbyterian Church are considering the erection of a new church. Pastor, Rev. Dr. T. Wardlaw-Taylor.

Toronto, Ont.—Mount Pleasant Ratepayers' Association decided to ask the city to provide funds for the building of a branch library in North Toronto.

Toronto, Ont.—Plans for the new Jarvis St. Collegiate of 32 rooms were adopted by the school property committee. The building is estimated to cost \$450,000.

Toronto, Ont.—At the annual meeting of Bloor Street Baptist Church a committee of members was appointed to inaugurate a campaign for the erection of a new church.

Toronto, Ont.—The members of the Church of the Resurrection (Anglican) plan the erection of a new church at Milverton Blvd. and Woodbine Ave., at a cost of \$32,000.

Toronto, Ont.—A recommendation was forwarded by the Board of Control to the City Council favoring the passing of a by-law authorizing the issue of debentures for \$2,500,000 to enable the Board of Education to proceed with its building program.

Toronto, Ont.—The erection of buildings in a number of parks, including a new bathing station at Hanlan's Point, have been recommended by the Parks Department, and amounts to cover the cost of these will be included in the estimates of the current year.

Victoria, B.C.—Tenders addressed to the City Clerk, for the purchase of an existing railway swing span bridge, will be received until noon, March 6. (See official adv.).

Wellington, Ont.—The contract for the construction of a Consolidated School has been awarded to the Norman MacLeod Co., Ltd., Kent Bldg., Toronto.

Windsor, Ont.—Ald. Samuel Keyser plans to build a large apartment house at a cost of \$150,000.

Winnipeg, Man.—The Woolworth Building was destroyed by fire.

Winnipeg, Man.—Fire damaged the Woods Building to the extent of between \$25,000 and \$40,000.

Yak, B.C.—The Provincial Department of Public Works awarded the contract for the construction of a school here to J. MacLeod, of Cranbrook, B.C.

MISCELLANEOUS

Bienfait, Sask.—A provincial charter has been granted to the Lignite Coal Mines, Ltd. Capitalization, \$200,000.

Chanvin, Alta.—A provincial charter has been granted to the Kirby Construction Co., Ltd. Capitalization, \$20,000.

Edmonton, Alta.—A provincial charter has been granted to the Barry Sheet Metal Co., Ltd., Edmonton. Capitalization, \$20,000.

Georgetown, Ont.—The offices of the Georgetown Foundry Co. were damaged by fire to the extent of \$10,000.

Kingston, Ont.—The City Council decided to call for tenders for annual supplies. Clerk, W. W. Sands, M.D.

Lethbridge, Alta.—Tenders addressed to the Irrigation Council of Alberta, Lethbridge, Alta., will be received until 3 p.m., February 21, for Branch Canal Masonry (See official adv.).

London, Ont.—The approval of the Board of Health has been received by the Public Utilities Commission for the expenditure of \$250,000 on waterworks and electrical development in this city. The Council will now be asked to take the necessary steps to have the question placed before the Ontario Railway Board for sanction. A by-law will be prepared with this end in view at the next meeting of the Council.

Mimico, Ont.—The Town Council decided upon the following expenditures for local improvements: Sewers and

waterworks, \$30,000; roads, \$45,000; and sidewalks, \$5,000. Town Clerk, J. A. Telfer.

Ottawa, Ont.—Works Commissioner A. F. Macallum will make a report to the Board of Control on the proposed improvements to the shore of the Rideau river, east of Bank St.

Ottawa, Ont.—Application will be made to the Legislative Assembly by the Municipal Corporation of the City of Ottawa for authority to execute and complete the following works and to raise upon debentures the sums of money mentioned for same: The construction of a sewer to serve the Lady Grey Hospital at a cost of \$85,000; completion of the Pinard St. sewer, \$18,000; construction of an asphalt or asphalt and wood-block pavement on Nicholas St., between Rideau St. and Laurier Ave.; completion of the St. Patrick St. bridge, \$85,000; permanent repairs and additions to the Civic Garage, \$10,000; construction of a viaduct over the Grand Trunk and Canadian Pacific Railway tracks on Wellington St., \$150,000 (Corporation's share); construction of a bridge over the Rideau Canal at Somerset St., \$100,000 (Corporation's share); construction of water main extensions and services, \$100,000; and the purchase and installation of water meters, \$30,000.

St. Catharines, Ont.—The local Chamber of Commerce has been assured by Hon. W. C. Kennedy, Minister of Railways and Canals, that engineers of the Department have been instructed to report on the feasibility of constructing a turning basin and docking facilities on the Welland canal here.

Sapperton, B.C.—Fire caused a half million dollars' damage to the Brunette saw mills. The saw and planing mills are destroyed.

Toronto, Ont.—Works Commissioner R. C. Harris will report to the Works Committee on the paving of St. Clair Ave., from Cobalt St. to Runnymede Road.

Toronto, Ont.—The Works Committee adopted a supplementary report from Works Commissioner for authority to proceed with the construction of a new bridge on Gerrard St. over the Don, at a cost of \$832,000.

Toronto, Ont.—The Works Committee passed the estimate of Works Commissioner Harris for the construction this year of a pure water reservoir at the Island at a cost of \$750,000. Estimates amounting to \$894,486 for water main extensions were also passed by the Committee.

Toronto, Ont.—The Works Committee passed the estimate of Works Commissioner Harris for the construction this year of a bridge on St. Clair Ave. east, over Reservoir Ravine, at a cost of \$712,000. The proposed new bridges across the ravine at North and South Glen Road and the Spadina road bridge were struck out of the estimates by the Committee.

Toronto, Ont.—Estimates of the Works Department for 1922, prepared by Works Commissioner R. C. Harris, call for a total expenditure of \$10,425,101. Under the heading "Capital Expenditures," for which \$7,765,970 is asked, \$2,021,904 is for sewers, the largest item of which is \$552,000 for a relief sewer down Rosedale ravine, from Yonge St. to the Don. There is another item of \$210,000 for a relief sewer from Bloor St. via Charles, Church and Park Road, to Rosedale relief sewer; Parkdale district relief sewer, \$461,000; Roncesvalles district relief sewer, \$150,000; Jones Ave. and Gerrard St. relief sewer, \$136,000. In the railway and bridge section the north and south Glen Road bridges are reinserted at an estimated cost of \$1,050,000; replacement of Spadina Road Bridge, \$72,000; Moore Park bridge, \$712,000. In the water supply section \$1,050,000 calls for the following: Additional pumping station and steam plant at Riverdale, \$200,000; 20,000,000-gallon reservoir at the Island, \$750,000; additional high pressure pump, \$100,000. For water mains the amount requested is \$2,813,566, of which \$723,080 is for a 36-in. main from Front St. to Dupont St.; \$448,694 for mains from the main pumping station to Front St., \$975,000 for extension to the high pressure system, which was recommended by the commissioner last year; \$221,000 for an improved supply at the Island.

New Road Bridge Opened Over Sixteen Mile Creek

Provides Alternate Route From Toronto to Hamilton — Longest Bridge Yet Constructed on Provincial Highways — Eliminates Last of Heavy Grades on Dundas Road — Details of Design and Erection Methods Described

BY T. D. MYLREA

Engineer, Norman McLeod, Ltd., Toronto

WITH the formal opening on December 20, 1921, of the new bridge over Sixteen Mile Creek, on the Dundas Road, five miles northwest of Oakville, Ont., the second and last heavy grade on this Toronto to Hamilton route was removed. It has long been recognized that owing to the heavy traffic on the Toronto-Hamilton Highway another thoroughfare was desirable, and the old road opened by General Simcoe offered a direct route equally as short as

to make a straight line passage by the cut and fill method, beginning operations on the west bank. Excavating by means of shovels and wheelbarrows they succeeded in making a cut about thirty feet deep, but the excavated material was washed away as soon as thrown over the bank, so that the efforts of these courageous men led to nothing.

Consequently, the only remaining means of getting across the valley was taken. A ramp-like slope was cut

BRIDGE OVER SIXTEEN-MILE CREEK, NEAR OAKVILLE, ONT.

the Highway. It had the additional advantage of affording a much more direct route, over the Hamilton-Guelph road, to Guelph, Kitchener and other large towns lying between these points. While a section of the road is still unpaved, the Provincial Highways Department is actively at work, and it is anticipated that before long this work will be complete.

Old Time Method of Crossing Ravine

The Sixteen Mile Creek ravine has long been a bugbear to traffic. Years ago a group of nearby residents attempted

down each bank with sharp turns at top and bottom, and the creek was bridged with an 85-ft. steel truss span having a 16-ft. road way. The soil being of shaley clay, these 16½% grades were very dangerous, particularly in wet weather. A glimpse of one of the grades may be seen over the old truss span, between the two right hand piers on the photograph.

Principal Dimensions of Bridge

The bridging of the Twelve Mile Creek near Tansley on the same road was recently carried out so successfully that the same design and method of construction was adopt-

SECOND SPAN READY TO BE LOWERED—PILOT STILL IN PLACE

FIFTH SPAN READY FOR THE PILOT TRUSSES

REFUGE BAYS ARE PROVIDED OVER EACH PIER

ed in bridging the Sixteen Mile Creek, and with equal success, although the Sixteen Mile Creek Bridge is a much bigger structure. The super-structure of the new bridge consists of a concrete floor carried upon eight spans of lattice trusses of 108 ft. 6 in. span, spaced 13 ft. 6 in. center to center, with 65 ft. span at the west end. These girders were formerly in use on the Intercolonial Railway, and had been replaced because of the heavier traffic. With new cross frames and laterals, analysis showed them to be entirely inadequate for their new usage. The spacing of the piers was therefore predetermined. The 65 ft. span, which is at the right hand end of the photograph cannot be seen owing to the fact that it extends up the gully excavated so long ago.

The distance from face to face of the ballast walls is 934 ft. which with the 30 ft. splayed wing walls of the abutments gives an extreme length of 993 ft. The height from water level to bridge floor is 117 ft. The clear distance between handrails is 20 ft., and allowing for a 6 in. curb on each side, a 19 ft. roadway is provided. There are no sidewalks, but over each pier on both sides of the bridge are refuge bays 12 ft. 9 in. long and 3 ft. wide, with floors flush with the top of the curbs. The roadway is crowned 3 in. at 20 ft. centers on each side are drain holes. A projecting lip on the bottom edge of each hole prevents water from trickling over the structural steel.

Altogether there were 370 tons of structural steel, 145 tons of reinforcing steel and 8,300 cu. yds. of concrete in the structure.

The County of Halton, which carried into execution the construction of the Tansley Bridge, also undertook the work of building the Sixteen Mile Creek Bridge. The Dundas road, however, was at this time taken over by the Provincial Department of Highways, and the work carried to completion under its direction. The new bridge, as well as the Tansley Bridge, will safely carry the heaviest class of loading prescribed by the Department of Highways.

In the design of the bridge simplicity and economy were kept foremost in mind, as far as possible consistent with appearance, no elaborate ornament being used anywhere in the structure. The upper 50 ft. of all piers is identical and consists of a pair of twin columns braced with struts 3 ft. x 4 ft. 6 in. reinforced to resist wind stresses. These columns are each 6 ft. x 12 ft. at the bottom and are battered toward the top. The only difference in the various piers is in the height of the lower portion, except that the three piers closest to the creek are provided with ice breakers to resist the rush of ice in the spring break-up. The lower shafts were made hollow, resulting in a saving of more than 1,000 yards of concrete.

Before deciding on the type of floor construction various designs were made. The comparative cost of steel and concrete floor beams was found, with the result that concrete floor beams at 5 ft. centres, coming over the panel points, were used. The additional cost of sidewalks and of refuge bays was computed and owing to the fact that the distance from any town precluded any large pedestrian traffic, sidewalks were abandoned, but the refuge bays mentioned above were provided.

The handrail is formed of precast panels set in grooves in the curb. These panels were made as nearly alike as possible, slight variations resulting in the refuge bays and larger posts. They were cast on the flat, the openings being formed by strips of wood of proper shape tacked to the forms. By making all openings the same size and taking up variations in panel length by slightly varying the width of the spindles, the same moulds were used for all panels. The upper rail and intermediate posts were poured after setting the panels in place.

One end of each girder is fixed and the other end rests upon a nest of rollers. However, to provide against the possibility of the movement of the rollers being hindered by accumulated dirt, each pier is designed to resist the bending set up by temperature changes in the trusses. The resultant stresses and soil pressures in all cases are quite low. In the design of the fixed shoes and also in the sole plates under the roller rests, the deflection of the trusses under the heavy dead load was considered. As may be seen in the detail, a strip of metal 4 in. long and the full width of the shoe projects downward from its lower surface. These strips bore directly on the piers, and after the full dead load was in place and full deflection had occurred, the remaining space under the shoes was filled with a strong mortar. Thus all danger of the shoe riding on its forward edge with the consequent possibility of spalling off the pier copings was obviated.

Expansion joints are provided in the bridge deck, in the floors of the refuge bays and in the handrail directly over each pier. In the floors and decks plates fastened to one slab are free to slide upon the adjoining one. In the handrail, pins fixed to the end of one rail slide loosely in pipes embedded in the end of the next one.

Cable-way Used in Construction of Bridge

The construction of the bridge was carried out entirely by means of a cable way composed of a 2-in. steel cable, supported by 100 ft. wooden towers 1,200 ft. apart, and

CLOSE UP VIEW OF HAND RAIL AND REFUGE BAY

was capable of lifting a load of 5 tons. Owing to the fact that this cable way could be used for only one operation at a time a large number of men was not required. The trusses were brought from Oakville to the east bank of the valley, where they were assembled and launched; and all operations were therefore started at the east end and carried on toward the west. All other material was brought to the west bank since the quarries, mills, etc., were closest to this side. The construction plant, consisting of a derrick, with a clam shell bucket for rehandling the materials, measuring hoppers, concrete mixer and cable way driving mechanism, was also located on the west bank. Advantage was taken of the small gulley, previously mentioned, in the location of the mixing plant. The measuring bins were on the ground level, on the edge of the gulley and the concrete mixer was located part way down its side. Thus in handling the materials from the stock piles to the measuring bins no great lift was required, and the materials were chuted from the bins to the mixer by gravity. A small pumping station, located on the edge of the creek, supplied water for the various purposes required.

As all foundations were in a soil composed of shale and practically impervious clay, no water troubles were encountered even in those piers nearest to the creek.

One set of forms sufficed for all the piers. As may be seen in the photograph they were built up in independent sections and 14 ft. high, and as the concreting progressed upwards in one pier the forms from the lower portions were removed and used in the next one. The reinforcing rods were ordered in lengths just enough longer than the height of the corresponding form section to provide a proper bond to the next section above. Thus in pouring the concrete there was no trouble in getting the cable way bucket close to the spot where the concrete was to be dumped. A forest of rods projecting a long distance upward would have made this an exceedingly difficult matter. Each form section was assembled on the ground, and all the reinforcing rods in that section were securely wired in position, and form section and bars were hoisted into place as a unit. This did away with the difficulty of building forms and placing steel high in the air. In the removal of the side panels of the upper section of these pier forms, the cable way was at a slight disadvantage. The panelling in the outer face of the twin columns made it impossible to remove the forms by direct lift, and it was necessary to resort to a tag line carried up the valley to give the required lateral movement.

Unique Method of Erecting Trusses

Owing to the height of the piers, the cost of falsework for the erection of the trusses would have been prohibitive, and a unique method of launching was devised by the contractor. Each pair of trusses, with the lateral bracing riveted in place, was pulled forward on greased rail until it projected nearly half its length over the truss previously placed. The back end was temporarily lashed down and a pair of triangular pilot trusses, 60 ft. long, extended just over the next pier. The projecting ends rested on rollers carried on blocking on top of the pier. Girders and pilot

VIEW FROM BELOW SHOW RELATIVE HEIGHT OF OLD AND NEW STRUCTURES

trusses were both moved forward by a block and tackle arrangement operated by the cable way. The pilot trusses were removed, and the girders lowered into their proper position by jacks. Before launching, the tension web members of each truss were all temporarily reinforced to insure their proper action while the trusses were in a cantilevered position. As soon as the last girder had passed over the first span the work of concreting began and followed close behind the advancing trusses to completion.

The Sixteen Mile Creek Bridge was designed and constructed by Norman McLeod, Ltd., Engineers and Contractors, of Toronto, under the direction of the Provincial Department of Highways, and under the immediate supervision of Jas. A. Bell, consulting engineer, St. Thomas.

An important order has been awarded to Vickers' Ltd., London, England, for material for the electrification of South African railways. The total value of the contract is between £750,000 and £1,000,000, and was secured in the face of keen, foreign competition.

Masonry plate under rollers to bear only on 4" face until span receives its full dead load, thus permitting the shoe to adjust itself to the deflection of the span. Masonry plate then to be wedged up at the free ends and grouted under for full bearing.

DETAIL OF SHOE.

At a meeting of the Executive Committee of the Montreal City Council, it was suggested that a drainage board be formed along the lines of the present water-board. It was believed that such a board or commission would insure better co-ordination in plans of sewers now being built or contemplated. In the course of the discussion, instances were cited where the insufficiency of sewers was the cause of frequent floodings by the fact that the sewers were too small for the localities, or where a large sewer emptied into a small one, or where a large trunk sewer had been built at the cost of \$800,000 and had never been utilized.

PREPARING BITUMINOUS GRAVEL AND SAND ROADS

Practice for Repairing Roads Followed in Massachusetts —
 Author Discusses Bituminous Treatments and Gives
 Interesting Figures on Road Traffic.

By W. D. Sohler

Formerly Chairman, Massachusetts Highway Commission.

IT is prerequisite to having any road at all, even the dirt road, (1) that the road shall be adequately drained with not only side ditches but all necessary culverts to carry the water away from the road and the sub-base; (2) that for any poor soil such as silt, clay, loam, or other fibrous or soft material, an adequate foundation be provided. Frequently 12 in. of gravel or good sand will prove to be fully as good a foundation as 8 in. of field stone or Telford.

Under the topic bituminous treatments, surface treatments as well as bituminous construction will be discussed. To have any success at all, the road surface to be treated or coated must be absolutely well compacted, firm, and true to crown and grade with no dust pockets or soft material. The macadam should be brushed clean and the gravel road well shaped and free from surplus loose dust.

A bituminous top on a road is waterproof and it must not be put on any road that is rough or rutted, because if it is, it will hold water in the depression, and every passing automobile or truck will throw the water out and take pieces of the road with it, so that in a short time you have very large holes all over your road.

Bituminous Surface Treatments

We find in Massachusetts, where we have very much more motor traffic than you are likely to have here, and whenever a road has an average of more than 150 motor cars a day, that it is impossible to maintain, either a gravel road or a waterbound macadam, without some bituminous surface on the top. This can be either of tar or asphaltic oil, never use any oils that have a paraffine base. Paraffine is a lubricant, and you want to use something that has a gum stickum and sticks your road together.

You can always tell whether the material you are going to use will produce good results or not, by putting some on your finger and thumb and rubbing them together. If they stick together and you cannot rub it off the finger without the use of pumice stone or your penknife they will stick to the road. If it will wipe off with a newspaper and merely leave your finger greasy and dirty like the grease from your automobile, then it will be no good on the road.

In preparing to apply a bituminous surface treatment always get out your covering and spread it on the road side before you start to apply the bitumen. It requires about 10 pounds of gravel or sand covering for every square yard of road surface, when you are using the lighter cold tars or oils and the heavier grades will require from 15 to 20 pounds to the square yard. If possible always spray on your bituminous material with a pressure distributing machine.

Apply about a sixth of a gallon to the square yard, and apply it to only one half of the width of the road at a time, have your men who are to spread the covering follow right along and spread it quickly and as evenly as possible.

Have them go back and be sure that the whole road is covered and kept covered so that it does not bleed, at any rate for the first week. It costs money to buy bitumen and whenever it is carried off the road it leaves a bare spot that will ultimately cause a hole in a very short time in wet weather, and thereby ruin your road.

The only remedy is to patch the hole at once, by painting it with the same material used with a whisk broom, and then be sure you cover this patch with sufficient material to prevent it picking up the second time.

Bituminous Materials, Tars

Now in regard to the material, we have got most excellent results with cold tar and material like Tarvia. It on both well shaped gravel and macadam roads, but be sure the surface is very firm or hard. The tars set up almost

immediately are brittle, do not heal themselves and while they make a most excellent road surface, they should not be used upon any loose or uncompacted road surface. They tend to break and go into pot holes and if these are not immediately patched your road very soon disintegrates and goes to pieces.

The proper way is to renew the surface film, immediately the underneath part of the road surface is uncovered, otherwise, a spot starts the size of a dollar which will soon become larger if there is considerable traffic.

Asphaltic Oils

The asphaltic oils, on the other hand, can be applied to softer and looser road surfaces, particularly gravel. You can use the asphaltic oils that can be applied cold containing about 45 to 50 per cent of asphalt.

Apply about a third of a gallon to the square yard of road surface and cover it, in the manner described above. This treatment can be repeated, and when asphalt is used you will find that you can shape your road back in the Spring and apply your second surface treatment, and you will have a considerable quantity of the asphalt left, so that the results during the second year are much better and more permanent than they were the first. After two or three applications, unless your traffic is extremely heavy, you will find that you have a road surface that may go for a year or two years, without another treatment, always provided you keep it properly patched.

Suggestions for Patching Roads

Always patch before you get a hole and keep the surface intact. When patching, make the sides of your hole with a little shoulder, to hold the material in place, use some patching material either the asphaltic oil used on the road, or K. P. which is a material made of tar that can be used cold, or something like Headly oil which is a fluxed asphalt that can be used cold. Grade your material, using either gravel bank or broken stone with sizes that are at least a half the depth of the hole for the larger sizes and graded down to the very finest sand, say a sand that will pass a 200 mesh. Be sure it is thoroughly mixed and coated before it is put into the hole. Tamp it in and remember that it expands a little with water so leave your hole possibly one quarter of an inch below the surrounding surface of the road or you will find a bump will develop later.

After the patch is made, cover it before you leave it with dry sand, or if necessary, dirt from the road side to keep it from being picked up by passing vehicles. You want to keep your bituminous surfaces on the road and to do this, they must stick to the road firmly.

Bituminous Gravel

We have had most excellent results in Massachusetts in building what might be called gravel asphalt roads. We have built them since 1912 and they are all in excellent condition to-day. As we have gone along, we have constantly built them better and stronger because of the increase in heavy motor truck traffic.

Originally, we merely made a sub-base carefully compacted to a true crown and grade, mixed the gravel and asphalt in a pit, hauled it to the road, spread it evenly over the surface 18 to 21 ft. in width, about 3 in. in depth loose so that when it was rolled it compacted to two inches.

All our later roads have had about 4 in. of broken stone of very coarse gravel underneath in the sub-base and very carefully shaped rolled and compacted and the asphaltic gravel has been spread upon that.

The mixture must be very evenly spread, so that it will compact smoothly and without any rolls or bumps. To do this, it is absolutely necessary that it should be dumped on a dumping board preferably of sheet iron and shoveled from this board as evenly as possible on to the road and then very carefully spread upon the road with rakes, so as to secure uniform spreading and density. I will give at the end of this paper the specification, so that I need not go too much into details just now.

As soon as possible, the mixture should be rolled with a light roller, a tandem roller is best, but a horse roller can be used if necessary. Roll it not only length ways but cross ways and diagonally, so as to avoid any wavy surface.

Never let the roller stand on any of the soft material or even stop on it, because it will make a depression, until it is thoroughly cool and compacted, run the roller onto the hard surface beyond to a stop. It is hard to give a rule for the proper time to roll; the mixture must be cool enough but not too cool.

In building these roads, the gravel has to be heated and uniformly heated to 250 to 300 degrees Fah. and the asphalt must be heated in kettles to 300 to 500 degrees. The two should then be mixed in some mechanical mixer, preferably a hot mixer, from this it is dumped into the cart and carried to the road and spread.

It is ready to roll, and should be rolled while it is still soft enough to compact thoroughly; this means the temperature of the mixture should be from 90 to 120 degrees Fah. This part of the work is occasionally troublesome, particularly when the mornings and evenings are cool, because the bottom on the ground and on the top exposed to the air will cool more rapidly than the middle. You cannot roll while the middle is too soft or too hot, because it will then squeeze out ahead of the roller and make waves, so you must wait until you can roll it without having it push out much ahead of the roller.

We have built a good many miles of road in Massachusetts of bituminous gravel and we think very highly of them, even for a very great volume of traffic, including quite a number of heavy trucks. We have also resurfaced and widened a great many miles of road, by this I mean 75 to 100 miles, where we used the old waterbound macadam road as a foundation, when there were 2 or 3 in. of it still left.

Where the traffic was heavy and we were building a bituminous gravel road, we have of course put in a foundation of gravel or field stone where the sub-soil was not good. We have then usually put a crusher into the gravel pit and crushed the larger stone, and perhaps field stone as well, and have laid the foundation of broken stone about 4 in. thick, well shaped and thoroughly rolled. On this, we have spread the mixed gravel and oil, so that it would be about 2½ in. thick, after rolling with a steam roller. Even with good soil conditions, where the roads had heavy traffic, we have used either broken stone or gravel in the sub-base, so that when watered and thoroughly rolled by the steam roller, it would be 4 or 5 in. in thickness.

The top course or wearing surface is just a mixture of asphaltic oil of from 90 to 120 penetration, thoroughly mixed with the heated gravel, and spread evenly so that it would be about 2½ in. thick after rolling. A tandem roller seems to be the best for rolling this material, as it can be used while it is hotter without producing depressions. This mixture usually requires about from 20 to 22 gallons of oil to the cubic yard of loose gravel, the oil being measured hot. The best results are obtained by the use of a gravel, using no size above 1½ in., but containing the other sizes down to the very finest material. It is advisable sometimes, if you have not enough fine sand in the gravel, to use stone dust or secure some fine sand from elsewhere, as the fewer the voids and the denser the mixture, the better the results. You do not need to infringe the Warren patent specifications. Here again, the finer the material, the greater the quantity of asphaltic oil that must be used per cubic yard and the stiffer the asphalt that should be used. Roads built of these surfaces have withstood very heavy traffic where the foundations are good from 8 to 9 years already, and are still in good condition.

Minimum Width of Road

These roads should be built at least 18 ft. in width, even with good material in the shoulders; with poor material, they should be 19 or 20 ft. in width to prevent having the sides cut off. A ¼ in. crown to the foot is better than a ½ in. crown. We now have a practice of banking all the corners and curves where it is physically possible

and giving them a grade from the outside to the inside of ½ to ¾ in. to the foot of width. When we first began the work, we used California asphaltic oil with good results, and since then we have used Texas, Mexican and other asphaltic oils with very good results.

Originally, these roads cost no more, and usually a little less, than waterbound macadam, and they were much more economical to maintain and withstood automobile traffic and motor traffic much better.

They originally cost about 60 cents per square yard, including the broken stone or gravel bottom, but not including grading, foundation or drainage. Last year the cost for the surface ran up to \$1.25 to \$1.50 per square yard, materials, teams and labor having advanced in price.

Traffic Roads Will Withstand

It is hard to predict just what traffic, sand and oil roads will withstand. They have now stood for 12 years in reasonably good condition on roads that had 600 to 800 automobiles a day, 47 to 70 2-horse teams a day, and an average of about 38 trucks a day. They have had go over them without any noticeable damage quite a few motor trucks carrying oil or gasoline that would weigh up to 14 tons including truck and load.

The gravel and oil mixed roads, and those that have been resurfaced with gravel and oil, have stood satisfactorily for 6 to 8 years with much heavier traffic than this, especially in trucks. I have in mind one section in particular that was constructed and opened up to traffic leading directly to Camp Devens, where, as you perhaps know, they had a cantonment for about 30,000 soldiers, built during the war. It had some days as many as 700 trucks going to that cantonment, and when they built a very large hospital there, they moved from 30 to 40 lumber trucks, weighing 12 to 13 tons including the load, over that road every day. This made very heavy traffic indeed for the two years that the road has been built. I think I am safe in saying that this road has never shown any signs of weakness or needed any patching whatever.

A blanket coat of hot oil on macadam will carry a much larger number of teams if there is a ratio of two to three automobiles on pneumatic tires to each team to keep the bituminous surface constantly rolled down when the horses and teams pick it up. But note that a very few teams on narrow tires, or a few very heavy teams every day, will destroy the surface if the load is heavy to shear down entirely through the surface to the stone.

If this process is repeated once or twice a day, a rut soon develops and the road becomes muddy and the bituminous surface is rapidly disintegrated. Light oil or cold tar will then be more serviceable, laying dust while the stone takes the wear.

We have maintained a few miles of road in reasonably satisfactory condition with annual applications of a cold tar or water gas tar. They have required one-half gallon per square yard annually, and the results have been about the same and certainly no better than where we have applied two quarter gallon coats per square yard of light asphaltic oil the first year and one quarter gallon per square yard each succeeding year. The cost for the cold tar has been more.

Invariably we clean and patch the road first and cover the bituminous material sufficiently to prevent its picking up. We have sometimes tried dispensing with the cleaning and covering but shall not repeat that expensive experiment. We can usually have the light asphaltic oil sprayed onto the roads by motor trucks for 1.2 to 1.5 cents per sq. yard, using one-fifth to one-quarter gallon per square yard.

The cleaning, patching and covering costs about the same. You must use some bitumen on the surface of either a gravel or a waterbound macadam road, if there are any motor vehicles using the road every day, say over 100.

Economical Road Surfaces

It can be stated in several ways: When your road costs you more than 10 to 15 cents per square yard a year, to maintain it always in proper condition, it is cheaper to substitute some more expensive and more permanent road

surface or road, and pay the yearly interest and sinking fund requirements to extinguish the cost of the road in a series of not more than from 15 to 20 years. No road should be bonded for any longer period.

Another way of stating it, would be that taking a waterbound macadam road or even a gravel road that whenever it wore out, more than half an inch per year under the traffic and certainly beyond any question, when it wore out an inch a year, because of the traffic, you are absolutely driven to a stronger and more expensive type of pavement. This, not only because of the cost of the yearly maintenance which is far in excess of the cost of interest and sinking fund, but also because when any road wears out more than half an inch a year, it never does so evenly, and no matter how much money you spend, you can never keep that road surface in any proper or satisfactory condition.

If the average, is say, one inch, that means that the road wears, say an average from a quarter to half an inch in some places but three or four inches in others, and is therefore, full of large holes and depressions.

It really is not then a question of resurfacing proper but the only way to get the road back into condition is to spike it up, reshape it, add new material to it, an average of an inch the whole length of the road and reroll it. This really comes very close to reconstruction, and when this time arrives, it seems to me, it is not a question of argument, but of demonstrated fact, that a stronger road crust should be provided at this time, with at least as good as a bituminous gravel, or bituminous macadam built by either the mixed or penetration method, at any rate, for the top two inches, using a proper grade of either asphalt or tar. The yearly maintenance would immediately be reduced to practically nothing on the road surface of a properly built road for the first two or three years and should not exceed a very few dollars per mile for patching the few holes that might develop during the next ten or twelve years.

I may say, that in our experience, we have found that the tar roads generally require a light surface treatment every two or three years, whereas, the asphalt roads will heal themselves and go much longer without any surface treatment, if a proper grade of asphalt is used.

In many places it has been found that one half gallon to the square yard spread onto a tar road of one of the good asphalts and properly covered will last a considerable number of years.

This experience, not confined to Massachusetts but is the experience of a number of other States, where tar has been used, notably Rhode Island, where ten years ago they had their entire trunk road system constructed mostly of tar, and it went to pieces within five or six years because they were not given the money that was necessary to provide either for the patching or surface treatment, necessary to preserve the road.

They have got to rebuild and they are doing it, but on a few sections, where they used an asphalt surface the tar road has stood up to the present time in perfectly good order.

Approximate Cost of Road Materials

Prices are very hard to compare in different places. It may, however, serve as some indication for you if I give you a short statement of what the present prices are in the State of Massachusetts.

Our bids for surface asphaltic oils or for surface cold tar treatments for 1/3 of a gallon to a square yard covered, are from 9 to 10 cents to a square yard.

Our labor cost is about \$3.00 per day of eight hours. The asphaltic oil is costing about 9 cents per U. S. gal. spread upon the road. This would be done by the oil company by contract.

In old times our bituminous gravel or asphaltic gravel roads were frequently built from 35 cents to 50 cents per square yard for the surface in place, complete. This does not include any foundation, grading or even preparing the macadam bottom, that we usually used. The asphalt used at that time cost about 12 1/2 cents to 15 cents per gallon.

The bids to-day for this surface for either bituminous sand or bituminous gravel are from 95 cents to \$1.15 per square yard for the surface alone, complete.

We used to build the roads complete, except for drainage, foundation and base but including the 4 in. macadam bottom for from 85 cents to \$1.00 per square yard. To-day it costs from \$1.50 to \$1.70 per square yard.

The asphalt used in this work was about the same as to-day, 12 1/2 cents per gal. and it requires from 2 to 2 1/2 gal. for each square yd. of road surface complete. It requires from 20 to 24 gal. of hot asphalt for each cubic yard of gravel. The oil expands in heating about 1/7 for 350 degrees Fah. I am speaking entirely of the American gallon; the Imperial gallon is considerably larger.—Paper read at the Annual Convention of the Canadian Good Roads Association, Halifax, N.S.

MANY LARGE FIRES OCCURRED IN 1921

FIRE losses in Canada during the past year are estimated by "The Monetary Times" at \$29,987,510, against \$27,371,574 in 1920. This is the highest loss on record, with the exception of 1918, when the total of \$31,315,844 was reached. It is a per capita loss of \$3.33. There was an exceptionally large number of large fires during the year, though none of them amounted to a conflagration.

The results may be summarized as follows:

	1919	1920	1921
Average monthly loss—			
	\$1,933,970	\$2,280,964	\$2,498,959
Loss per capita—			
	\$2.90	\$3.42	\$3.33
Fire with damage of \$10,000 or over—			
	238	301	377

The Monetary Times' record for the past three years shows the following monthly losses:

Month	1919	1920	1921
January	\$3,915,290	\$2,637,850	\$2,237,900
February	1,091,834	1,859,575	2,735,500
March	2,154,095	1,795,200	2,112,200
April	1,080,070	3,229,500	2,510,700
May	1,785,130	2,001,819	3,811,350
June	3,337,530	1,424,310	2,303,400
July	1,118,377	1,420,850	2,860,250
August	1,374,495	1,857,800	3,014,860
September	1,940,272	2,480,185	2,410,300
October	1,023,288	2,467,901	2,189,790
November	2,339,870	2,769,800	1,818,750
December	2,047,496	3,386,475	1,952,600
Total	\$23,207,647	\$27,371,574	\$29,987,510

SASKATCHEWAN GOOD ROADS ASSOCIATION

FIRST steps towards the formation of a provincial good roads association for Saskatchewan were taken at a conference between members of the government, representatives of the associations of urban and rural municipalities, associated boards of trade and officers of the Dominion Good Roads association held in Regina recently. The conference was held in the office of the Hon. H. M. Hamilton, Minister of Highways, and was presided over by Hon. S. J. Latta, president of the Dominion Good Roads Association. After being in session for about three hours the members attending the conference decided to organize a provincial good roads association which would be made up of representatives of the leading organizations in the province interested in this work. To this end a small committee consisting of Hon. S. J. Latta, E. G. Hingley, L. A. Thornton and W. E. Dennison was appointed to go into the whole question and report at a later conference concrete proposals regarding the basis of organization.

REVIEW OF INVESTIGATION INTO DETERIORATION OF CONCRETE IN ALKALI SOILS

Dr. Thorvaldson Appointed to Take Charge of Research Work at University of Saskatchewan—Experiments Being Conducted—Details of Field Tests

AT THE annual meeting of the Engineering Institute of Canada held in Montreal, the following report was received from Prof. G. M. Williams, of the University of Saskatchewan, secretary of the Committee on Deterioration of Concrete in Alkali Soils:

An organization meeting of the committee as originally constituted was held at the University of Saskatchewan Saskatoon, April 23, 1921. A general discussion of the problem by the committee members, all of whom have been familiar with the effect of alkali on concrete for several years, indicated that there was complete agreement as to the course which should be pursued in the investigation. Since previous investigations have established the fact that the best of Portland cement concrete may not prove permanent under certain known exposure conditions, it was agreed that the main effort should be directed towards the chemical problems involved, including the constitution of cement and the chemical reactions the soluble salts and the constituents of the cement. There is at present little to be gained by an extensive series of exposure tests of concrete to field conditions and it was decided to limit this phase of the investigation to a limited number of concrete specimens which would later serve as a basis of comparison with future field work which might be planned as a result of the findings of the chemical laboratory.

It was further agreed that a physical chemist having the highest qualifications be obtained to direct and supervise the chemical research and steps were taken to survey the field of available men in that line of work. In order that the committee might have the benefit of the advice and experience of a number of chemists of the Prairie Provinces who are familiar with the alkali-concrete problem, the following were appointed to full membership on the committee:

Dr. J. W. Shipley, professor of chemistry, University of Manitoba; Dr. T. Thorvaldson, professor of chemistry, University of Saskatchewan; F. C. Field, city analyst, Calgary; A. G. Blackie, city analyst, Winnipeg; and J. A. Kelso, provincial analyst, Edmonton.

The above have since taken an active part in the work of the committee.

A second series of meetings of the committee was held in Saskatoon, August 10 to 12, 1921. After thorough consideration of the names of available chemists it was decided to ask Dr. Thorvaldson, a committee member, to take charge of this chemical research, which he accepted subject to the approval of Dr. Murray, president of the University of Saskatchewan. Dr. Thorvaldson has been directing the work of several assistants during the past year in connection with certain phases of the alkali-concrete problem and it was felt that he would be in a position to take active charge with a minimum of delay. The University of Saskatchewan has since agreed to this arrangement and in addition to offering all of its available facilities to advance the progress of the investigation, has freed Dr. Thorvaldson from all class work, so that beginning with January, 1922, he will devote all of his time to the research.

Field Tests

Following the intention of the Committee that a limited amount of field investigation be started during the summer of 1921, concrete block specimens for exposure tests were molded in the Concrete Laboratory of the University of Saskatchewan for exposure to alkali soil waters at points in Alberta, Saskatchewan and Manitoba.

These specimens are cylindrical in shape, 7 in. in diameter and 21 in. long, molded in sheet metal forms. Two qualities of concretes were employed, having strengths of approximately 1,200 and 2,500 lb. per sq. in. at 28 days.

Canada and Super brands of Portland cement were used. Three different aggregates were used for each of the above cements and qualities of concrete, gravel used in commercial work in the vicinity of Winnipeg Saskatoon and Strathmore, Alta.

After preliminary tests of the cements and aggregates, batches of concrete were carefully proportioned and mixed by hand and test specimens were cured in moist air for 27 days after 24 hours of hardening in the forms. From each batch of concrete prepared, there were molded not less than six large exposure cylinders, three 6 by 12-in. compression test cylinders, and two slabs, for permeability tests of the concrete. All obtainable data, such as characteristics of cement and aggregate and weights of each used, were noted for further study.

In addition to plain concretes listed above, other batches were prepared using various waterproofing and alkali-proofing compounds suggested by the committee members and different manufacturers, as well as "Commercial" cement, a natural cement manufactured near Winnipeg. Some waterproofings are of the integral type while others are liquids or bituminous coatings applied to the surface after curing is completed. Each batch of concrete molded was given a series number. In all, 28 series or batches were prepared. Before shipment all specimens were wrapped in heavy paper and crated separately for protection.

Shipments of 56 test cylinders (28 series) were made to the following points early in September for exposure to alkali conditions:

Cassils, Alta.—One group was placed in a heavy alkali tract of land near Cassils, Alta., in a locality which has been used for several years by the Department of Natural Resources, C. P. Railway, for similar experiments.

Grandora, Sask.—One group was placed along the shore line of a sulphate lake near Grandora, Sask., about 14 miles west of Saskatoon.

Winnipeg, Man.—A group was placed along the aqueduct of the Greater Winnipeg Water District at a spot where analyses showed the ground water concentration to be highest.

At Cassils, Alta., the ground water table is only slightly below the ground surface and the blocks were embedded with about 6 in. projecting. At Grandora, Sask., the same scheme was employed. At Winnipeg the water table was found about 8 ft. below the surface, which necessitated the excavation of the soil to a depth of 8 ft. in an area about 50 ft. square.

A systematic method of securing samples of the alkali waters during the period that the ground remains unfrozen has been adopted, and the inspection of the condition of the individual blocks will be made at least twice yearly, in the spring and in the fall.

The Portland Cement Association is at present conducting extensive field experiments in the United States and is co-operating with the work of our committee by furnishing groups of 82 blocks each for exposure at the above three points. These have been installed alongside our own blocks and will be given the safe inspection. Super Cement (America) Ltd. has also furnished a number of small test pieces made in their laboratory, which have been placed with the large blocks.

Chemical Research

Since September three graduate students holding bursaries from the Honorary Advisory Council for Scientific and Industrial Research have been working on certain phases of the problem. The laboratory work so far done is of a preliminary nature concerned mainly with the action of the various salts under consideration on some of the simpler substances in cement and concrete. A considerable quantity of equipment specially adapted to this investigation has been ordered and is now being delivered.

In September Dr. Thorvaldson made a trip to Washington, D.C., and conferred with the members of the Cement Division of the Bureau of Standards and the research workers in the Geographical Laboratory of the Carnegie

Institution on questions relating to this investigation. The bulk of the advances so far made in America as to the constitution of cement has been accomplished at these two laboratories and it was therefore considered important to ascertain what work on this subject they proposed to continue and correlate our work with theirs. We look forward to a cordial co-operation with these institutions.

To date difficulty has been encountered in obtaining a trained assistant for the petro-graphical work. This phase should be carried on along with physical, chemical and colloidal examinations of the disintegration of concrete. In addition to the foregoing and the graduate students whose services will continue, additional assistance will be required and is now being arranged for, and the force of trained research workers will be increased as rapidly as the different phases of the investigation unfold during the next few months. As stated above, Dr. Thorvaldson is now devoting his full time to conducting and carrying on the chemical investigation.

INSTITUTE BRANCH SECRETARIES MEET

A MEETING of the branch secretaries of the Engineering Institute of Canada was held at the headquarters on Mansfield street, Montreal, on Jan. 26, lasting all day, for a general discussion of affairs. J. L. Busfield, secretary of the Montreal branch, presided, and there was a large attendance of secretaries of branches from Sault Ste. Marie, to Halifax and St. John.

Arrangements were discussed for greater co-operation between the various branches, plans for facilitating interchange of speakers at branch meetings, the standardization of branch by-laws, and ways and means by which the branch secretaries could give better personal service to the members of the various branches of the institute, thereby assisting in the promotion of the interests of the institute, its members and the profession generally.

The party was entertained at luncheon at the Engineers' Club, by J. A. Duchastel, and J. D. Farmer, chairman and vice-chairman, respectively, of the Montreal branch.

Those present included Messrs. K. G. Cameron, Sydney, N.S.; D. S. Cox, Halifax; H. F. Bennett, St. John, N.B.; M. J. Murphy, Moncton, N.B.; D. F. McLaren, Peterboro, Ont.; F. B. Goedike, Toronto; W. G. Wright, London, Ont.; Rex Johnson, Niagara Falls; J. C. Keith, Windsor, Ont.; J. Barnhill, Sault Ste. Marie, and Fraser S. Keith, general secretary of the Engineering Institute of Canada.

EXPECT DEMANDS FOR ROAD GRANTS

GROWTH of the use of motor vehicles in Canada is leading to a demand for increase of the Federal highways grant, and it is likely that deputations from many sources will make their appeals to the Government for increase in that grant, before the expiration of the present agreements.

In 1919 the Federal Government set aside \$20,000,000 to be expended on highways construction during the next five years, this amount to be allotted to the various provinces on a basis of 40 per cent of the cost of approved highway projects. So far all the provinces except Alberta have taken advantage of the grants, and the Federal Government's share of the estimated cost of projects under agreement to the end of last year was \$11,699,066, well over half of the entire sum set aside for five years.

The provision of a Federal grant has had the effect of stimulating highway construction in all of the provinces and it is felt in many quarters that if no further funds were provided there would be at least a temporary halt in the provincial roads construction plans.

Motor vehicle registration throughout the Dominion is stated to have increased almost 500 per cent from 1914 to 1921 and this year, it is expected the increase of the last few years will be borne out by the new statistics which are in the process of collection. It is because of this growth of motor traffic that the demand for better highways throughout all the provinces has increased, and automobile

associations in various parts of the Dominion have urged that the Federal Government should take steps before the present legislation expires, to provide for either a continuance of a similar grant or an increase.

LARGE TURBINE DESCRIBED

AT THE afternoon session of the Engineering Institute of Canada convention at Montreal on January 25, Julian C. Smith, vice-president and general manager of the Shawinigan Water & Power Co., gave an interesting paper on the design and construction of the new 41,000 h.p. turbine unit, which the delegates had inspected in the morning at the plant of the Dominion Engineering Works, Rockfield.

Mr. Smith's paper was illustrated by lantern slides, and was of a technical character. He stated that this unit had by far the greatest capacity of any single-runner unit installed in the province of Quebec, and was second only in power output to the new units now commencing to be operated at the Queenston-Chippawa plant of the Hydro-Electric Power Commission of Ontario. Mr. Smith gave a complete description of the new unit.

The chair was taken by John T. Farmer, vice-chairman of the Montreal Branch, and a vote of thanks was passed to Mr. Smith for his paper.

HALIFAX ENGINEERS APPOINT OFFICERS

THE second annual meeting of the Association of Professional Engineers of Nova Scotia met in the Green Lantern, Halifax, N.S., on Thursday evening, Jan. 19. It took the form of a supper meeting, with business afterwards.

This Association was incorporated by Provincial Statute on May 26, 1920, and now includes a membership of 243 engineers, representing every branch of the engineering profession, such as civil, electrical, mechanical, mining, etc.

In addition to other important business, the following officers were elected to fill the vacancies in the Council for the year 1922: Pres., C. E. Dodwell, district engineer, Department of Works, Halifax; vice-pres., George D. MacDougall, chief engineer, British Empire Steel Corporation, New Glasgow.

Councillors—F. R. Faulkner, Professor of Civil Engineering, N.S. Technical College; K. H. Smith, chief engineer, Hydro-Electric Commission, Province of Nova Scotia; D. H. McDougall, vice-president British Empire Steel Corporation, New Glasgow; C. H. Wright, manager, Canadian General Electric Co., Halifax; A. F. Dyer, chief engineer, N.S. Construction Co., Halifax.

At the Welland Hotel, St. Catharines, Ont., the Niagara Peninsula branch of the Engineering Institute of Canada held a meeting and dinner. A feature of the evening was an illustrated lecture on "Rural Power Distribution in Ontario" delivered by J. W. Purcell of the Ontario Hydro-Electric Power Commission.

The members of the Chatham City Council, the County Council and the directors of the Corn Fair were the guests at a noonday luncheon given on Jan. 25 at Chatham, Ont., by the directors of the Chamber of Commerce for the purpose of discussing good roads. Speeches were delivered by County Clerk Fletcher, W. G. McGeorge, Kent County Engineer, and R. O. Wynne-Roberts, of Frank Barber & Associates, Ltd., Toronto, showing the importance of undertaking an extensive program of road improvement in Kent County this year. Mr. Fletcher pointed out that Kent County had spent \$570,000 on good roads in the county last year, but the people must become educated to the fact that a great deal more money is necessary to be spent before the roads of Kent are in good shape.

NEW DEVELOPMENTS IN ELECTRIC POWER

Long Distance Transmission Has Now Become Practicable —International Relations As Affecting Power— —Broader Market for Power in Future

IN an interesting article in the "Monetary Times Annual" for 1922, Mr. Andrew T. Drummond deals with the new developments in electrical power in Canada: The newer developments in the electrical transmission of power, under which there is a strong probability that industrial centres five hundred and perhaps even one thousand miles distant from a great waterfall will, with relatively moderate loss in efficiency, be able to utilize the power from this fall, must now convince our governments and industrial leaders that in its numerous power sites Canada possesses facilities for developing its varied resources which should carry it to the forefront of manufacturing countries. These powers are by no means limited to the two millions and more horse power, it is expected, will be possible on the Canadian side of the St. Lawrence River, when the United States and Canada unite in developing the ocean highway between Montreal and Lake Ontario; and to the probably one million two hundred thousand horse power which is being, or can still be, developed within Canadian waters at Niagara Falls without lessening the scenic beauty of the surroundings. Millions of further horse power are available within our country.

Not every water fall or rapid is adapted for the development of energy. The head obtainable may be sufficient, but the natural conditions of the surrounding land may present a direct barrier, or be such that the cost of the work would not be compensated by the power obtained. The volume of water obtainable may be uncertain during the dry midsummer months, and there may be no facilities for forming reservoirs to hold back the spring floods and heavy rains, and let the surplus waters down, from time to time, to equalize the flow. Steam power derived from coal is the only present competitor of importance, but the existing high prices of coal, the cost of its transportation, and the expense and deterioration consequent on the necessary storage of huge quantities in order to provide for the winter months, all militate against coal, in comparison with the more convenient, clean and instantaneous electric energy, when delivered direct to the factory, or to the municipal distributing station within the city or town.

Power Resources

The United States claims, among nations, to have the largest amount of potential and developed water power, but when the important rivers of Canada falling into the Pacific ocean, the Arctic Sea, Hudson Bay, the North Atlantic Ocean, and the Gulf of St. Lawrence have been explored, and their falls and rapids have, in their height, volume and flow, been measured, there is no reason to doubt that the United States must easily yield the place to Canada. Much of the Dominion, in its far northern and north-eastern areas, including Labrador, and the entire country north of the Transcontinental Railway and the Saskatchewan River, is still unknown, except in, what might be termed, unconfirmed outline. Within these extensive limits of probably three thousand miles by twelve hundred miles, there are at least fifty rivers which are in magnitude from two hundred miles in length, onward to that great artery, the Mackenzie River, which, as it expands in its downward course, into a system of large lakes and connecting rivers, covers probably one thousand eight hundred miles. A few of these rivers, especially in Alberta, north of the railways, where, in the shadow of the Rocky Mountains, they, like the Athabasca, take their rise, have been recently surveyed in a general way, and their numerous rapids, and ample, but occasionally fluctuating, water supply taken note of. Others of these rivers are not only unsurveyed, but have been little known, except in a general way, to Hudson Bay, however, pass through country, the altitude of which above the sea is from 750 ft. to 2,000 ft. and upwards, these altitudes strongly suggesting that, in the reaches of these rivers lower down, power will be available.

Thus—to illustrate generally these northern rivers—where the Transcontinental Railway crosses Ontario and Quebec, and beyond the height of land, from which, among other streams, the following rivers flow northward to Hudson Bay, the altitude above the sea of the Nottaway River is 775 ft.; the Missinabi, 717 ft.; the Kenogami, 756 ft.; and the Albany, 1,177 ft., and these rivers, whilst having ample volume, are, excepting the Albany, of relatively only moderate length. In Alberta, the Athabasca River, where it is crossed by the Grand Trunk Pacific Railway, is 3,311 ft. above the sea level, at Lesser Slave Lake it is 1,899 ft., at Athabasca Landing 1,550 ft., and at Fort McMurray, after in the last eighty miles developing about twenty rapids, it is 817 ft. and the Athabasca and its lake expansion form part of the great Mackenzie system.

The Yukon, again, is a large river, taking its rise under other names in Canadian territory, where, at the confluence of the Lewis and Pelly Rivers, it is 2,965 ft. above the sea, and at Dawson City on the main stream, is still 1,200 ft. As another illustration, Wollaston Lake, on the height of land to the westward of Hudson Bay, is 1,300 ft. above the sea, and, apparently, at the source of Seal River, which through perhaps 250 miles, courses its way to that bay. Explorers have from time to time referred to falls and rapids on some of these streams, but excepting possibly, in the case of the Athabasca and Nelson Rivers, on the latter of which it is claimed that three of the rapids will develop over 3,500,000 horse power, the estimates, where any have been made, have been, in perhaps all cases, very roughly formed, and generally from information supplied by other parties, and with no impression of value being attached to them for power purposes. Nevertheless, all the known facts enable us to take it for granted that on these rivers, so many of which flow into the Arctic Sea and Hudson Bay, will be found a huge amount of potential energy, amounting to some millions of horse power, most of which, by reasons of distance and climate, must, for the present, remain undeveloped.

Long Distance Transmission

There is however, a future, and perhaps even an early future, for some of these powers, and long distance transmission will be an important factor in securing this. There are large deposits of iron, copper, coal, and other minerals, not explored in detail, but known to exist, in our north land, the mining of which, and all the chemical and metallurgical industries associated with this mining, will necessarily require inexpensive power. It is also suggestive that with the great cost of transporting coal to the central sections of the Transcontinental Railway in Northern Ontario and Quebec, and the nearness of important water powers there, it is worth investigating whether hydro-electric power would be any advantage. And we might even look further into the future. In this age of wonderful discoveries we must be prepared for the accomplishment of what may, at first sight, seem absolutely beyond the capacity of the human mind to grasp. The hopeful thought may just now rest in the imagination, but if, by some happy discovery, which may yet come, heat on a large scale can economically result from electric power, for use in our homes to replace coal and wood, the vast energy of our northern rivers which are distributed so lavishly over half a continent, may, with its varied resulting conveniences, ultimately prove to be another providential plan of the Creator which would help to lessen the rigors of the long winter months and make this north land a shade more habitable. Apart from these possibilities, there is the suggestion that industries requiring large amounts of power, like the production of nitrogen from the air, and of wood pulp, where the mills can still be conveniently close to the spruce forests, might also, through long distance transmission, utilize some of these northern powers.

Great Market For Power

Canada, as a manufacturing country, has attained a new status. There is no longer a reason why our governments should regard it as, primarily, an agricultural country, and why it should give encouragement only to the im-

migrant who will settle on the land. It is quite true that the western prairies as well as our eastern farms need many more men of that class, but our manufacturing industries now produce more value in output than the entire agricultural production of the country. With vast, and in many cases, untouched resources, supplemented by magnificent water powers which which to work them into exportable products, and by ample transportation facilities, we want direct encouragement to be given to men of initiative, enterprise and capital from Great Britain and the United States to co-operate with Canadians in developing these resources. We also want the skilled workmen to man the manufactories that must follow.

To export the raw material, and thus furnish work for scores of thousands of skilled men in other countries, instead of having manufactories to build up our own, has been one of Canada's serious mistakes in the past. Even the hydro power itself at Cedar Rapids on the St. Lawrence, and at Niagara Falls, and on the Rainy River, was permitted by the Dominion to be exported, like a raw material, to the United States, instead of the government compelling the American manufacturers—when such an opportunity presented itself—to locate on the Canadian side of the rivers and make their establishments the centre of busy industrial towns here. Even if the market for their manufactured goods was claimed by Americans to be chiefly in the United States, the much less expensive power, and the otherwise lower average cost of, at that time, producing such goods in this country, would have enabled these manufacturers to, perhaps entirely, pay the American duties, whilst, in addition, they could export from this side more cheaply than through United States ports. Conditions during, and since the war, have become greatly changed here both as to the home and export trade, and with large preferences now conceded throughout the Empire to Dominion products, there is a clear advantage to United States industrial works to establish branches in Canada. About six hundred of these are already located in, especially, Ontario cities and towns, and more are coming. In the face of this fact, there are still people in our country who have such limited vision and enterprise as to approve of the further export of power to the United States. It will be greatly to our discredit if we fail to take advantage of this special means of building up our country.

General Electric's Discovery

Two hundred and fifty miles are the extreme distance to which hydro-electric power has been thus far profitably transmitted. The recent discovery at the General Electric Company's laboratories at Schenectady, New York State, that one million volts are possible, will, it is there believed, enable the power current to be sent to distances double, and perhaps quadruple, the present maximum. The effect of this in our prairie provinces, for instance, would be remarkable, wherever the raw material could be laid down at low cost, and a sufficiently large market for the products could be found, and provided cheap coal did not interfere. The possible 104 ft. fall at Grand Rapids, where the Saskatchewan River falls into Lake Winnipeg would have within economical range, in the distribution of its power, such cities and towns as Regina, Saskatoon, Battleford, Prince Albert and scores of smaller places between Grand Rapids and the United States boundary line, whilst following the lead of Ontario, the advantages of power and light could be within the reach of thousands of farmers for use in farming operations. Similarly, Alberta, down to the United States boundary line, could be reached by the energy of the Athabasca River, should Calgary require, as is probable, for its own use the whole of the Bow River power.

Use on Railways

Electric power, as applied to railways, appears, thus far, to have its limitations. The steam roads which have for some years been experimenting with it on their lines, have confined its use, as a rule, to special work, as in tunnels, on grades through the mountains, and on work at terminals. On the other hand, the electric roads, with a quarter of a century of experience behind them, have only

given a limited attention to freight, which on the steam roads is the larger and much more profitable part of the traffic. With few exceptions, both in the United States and Canada, interurban electric roads have not proved profitable enterprises. They appear to be best adapted to passenger transport through very populous districts immediately surrounding large cities, or from city to city where these are very close to each other, and where, in each case, a very frequent service can be given with a certainty of large advantage being taken of it.

Hydro-electric power has, during recent years, been of assistance, but nothing can overcome the result to the railway of a limited population. The most attractive problem still to be solved in Canada is whether, with abundant, electrically-transmitted water power, it would be profitable to the railways and assist business, to electrify sections of the older steam roads, where, as in parts of Ontario, they pass through fine, productive districts possessing fair sized cities and towns in proximity to each other, the electric trains to take both freight and passengers. This is quite a different question from the building of new electric roads. The railway has been in operation for probably half of a century, a large business has been gradually developed, and it is only a case of further advantage being gained by the relatively light added cost of electrifying. From the steam road point of view the proposal is practicable, and, under certain conditions, would appear to be applicable to one or two branch lines of the Grand Trunk Railway in Ontario. The experience gained there would be of value in considering the electrifying of other sections. Should the Dominion Government assume, as it certainly should, its rightful control over all the international and navigable waterways of the country, including in this the whole St. Lawrence system from Lake Superior to the sea, the government railways will have ample opportunities of obtaining the necessary hydro-electric power.

Government Jurisdiction

The clear intention under the Imperial British North America Act of 1867 was that the Dominion should have the control of all international and navigable waters throughout Canada, and of the water powers developed upon them. For reasons difficult to understand, the Canadian Government has hitherto failed to realize the direct bearing upon trade and commerce which these water powers have. Especially has this been the case since transmission to great distances has become effective in helping to cheapen the cost of production among manufacturers, and to greatly expand trade, particularly by inducing manufacturers in the United States and Great Britain to establish branches of their works in this country. Further, at the present time, when new sources of revenue are so important, there could be obtained, without directly taxing the people, a large annual return, amounting to many millions of dollars from a reasonable charge for each horse power developed. The writer has repeatedly brought the subject of the Dominion rights, and the possible revenues from them, before different departments of the government.

What is wanted is a definite policy in regard to all water powers upon international and navigable rivers, under which they would be controlled by the Dominion in the interests of navigation, industries, railways and civic and domestic convenience, and would only be leased and at a fair annual rental, payable to the government, for each horse power of possible development. Finding no direct assertion of rights by the Dominion Government, the Ontario Government has actually assumed control of the power at Fort Francis on the Rainy River, at Sault Ste. Marie on the St. Mary's River, and at Niagara Falls, and has made claims to the undeveloped power of the St. Lawrence River below Prescott. It has further endeavored to fortify by acts of its own legislature much of what it has done. All this is of recent date, the first actual development of power under authority from it, materializing only in 1902.

Had the Dominion Government established a National Park at Niagara Falls, as it should have done, and was invited in 1880 by the Ontario Legislature to do, instead of

allowing, by its neglect, the Ontario Government in 1885 to undertake the work, simply as a park, and with no thought of water power development, there is no question that we should never have heard of Ontario's rights in water powers. The forthcoming report of the International Waterways Commission on the deepening of the St. Lawrence with a view to an ocean highway, and the action which the United States Congress and our Parliament at Ottawa take in regard to it, must necessarily bring to the front all questions as to Dominion and Provincial rights in both international and navigable waters. The Ontario Government may, however, rest assured that the heavy indebtedness which it has incurred in connection with Niagara Falls developments will, under any circumstances, be carefully guarded in the interest of the bondholders.

GOOD YEAR EXPECTED IN BUILDING TRADE

AN optimistic outlook for the building industry during 1922 was reflected in the proceedings of the annual meeting of the Builders' Exchange, Toronto. That the contractors are looking forward to a season of prosperity during the coming months was indicated in the various reports, especially that of Secretary George Gander, and the views expressed by different members.

The general attitude was that the only thing now needed to bring about a marked revival of activity in building in Toronto was a reduction of wages paid to the building trades to conform with the lowered costs of materials and contractors' profits. In this connection it was decided to launch a publicity campaign to place before the public the builders' views respecting the questions of wages and agreements which have restrictions regarded as a detriment to the building industry.

A resolution was passed also strongly protesting against the payment by the City Council of the 60 cents an hour rate to unskilled labor on the ground that such a wage was extreme.

In reviewing the conditions under which the builders of Toronto start the New Year, Secretary Gander stated:

"I feel safe in saying that prices are as near rock bottom as possible. We have the latest report of an institution which is continuously building, that their costs during one year have dropped 35 per cent. You then should have no hesitation in convincing the architect and owner to put their plans on the table at once and receive a pleasant surprise with estimates that are moderate in the extreme.

"Many expensive building propositions have been laid aside during 1919 and 1920 and office and house building is far behind the needs of to-day. It would be far better that these people start at once for we reasonably feel that a rush later on would only result in delay in delivery of materials."

The report points out that during 1921 no building proposition was abandoned because of prices being too high, each job being inside the architect's estimate.

In dealing with various matters affecting the building industry Mr. Gander says: "We do not agree with the Provincial Government in appointing a Labor man as vice-chairman of the Compensation Board. This office should have been filled by a non-interested party; as it is now, labor has representation and employers none, which is class legislation in every sense of the word."

Attitude of Labor

In the annual report of retiring president J. M. Scott, reference is made to the dealings with labor during the past year, special mention being made of the conferences of the various parties interested held in Ottawa last May and in Toronto in July, "solely for the purpose of trying to bring about a general reduction in building costs in order to help to stimulate the trade."

"As you are aware," the report comments, "labor rejected every proposition, even in the fact of the Minister of Labor's address wherein he warned them that the time had come for serious consideration of the question, yet they turned a deaf ear to all his suggestions. During the year

the wages of stonecutters, carpenters, lathers and laborers have been reduced. The other trades are still very high, but we trust will be so settled as to make the public or the investor feel satisfied that they will receive a fair return for their investment.

"The public cannot see eye to eye with the unions' one dollar per hour mark. This is to them like a red flag to a bull and a change from the dollar sign would be an easement to their feelings. We might just as well acknowledge the fact that for 1922 'The Public' will be the sole arbiter of extreme prices in the building trade, and lower prices are the only kind of an olive branch they will accept.

"I say truthfully that so far as contractors are concerned their competition of the present day keeps them from being blamed for high prices."

The report states that costs of materials have decreased considerably during the latter part of 1921, and remarks that had wages and materials been more moderate earlier in the season more work would have been gone on with.

Officers elected for 1922 were: President, W. H. Painter; First vice-president, W. Carmichael; Second vice-president, John V. Gray; Directors, James J. Brown, Edward Teagle, C. F. Till, Charles Bulley and J. M. Scott.

ENGINEERING INSTITUTE ELECTIONS

AT a meeting of the Council of the Engineering Institute of Canada, held recently in Montreal, the following elections and transfers were announced:

Members—J. F. Bell, Toronto; E. V. Buchanan, London; C. F. Draper, Montreal; F. W. Farncomb, London; D. E. Grant, Montreal; Thomas Montgomery, Sarnia.

Associate Members—R. De B. Austin, Toronto; C. W. Brown, St. John; R. E. Butt, Hamilton; H. B. Fisk, Drummondville, Que.; N. F. Harrison, St. Boniface; J. A. Laniel, London; T. E. McGrail, Ottawa; W. A. Robinson, Winnipeg; W. G. Scott, Montreal West; Sidney Snell, Toronto; T. L. Tait, St. Lambert, Que.; James Weir, Montreal; S. R. Weston, St. John.

Associates—W. C. Franz, Sault Ste. Marie; D. L. McKeand, Ottawa; D. M. McLean, Sherbrooke.

Juniors—A. D. Bishop, Windsor; J. B. Garneau, Quebec; W. C. Goodwin, St. John; C. A. Grupp, Waterdown, Ont.; F. S. Hartle, Winnipeg; T. H. Henry, St. Catharines; F. J. Igoo, Peterborough; G. D. Maxwell, Toronto; W. C. E. Robinson, Coldwater, Ont.; Keltie Wilson, St. John; K. M. Winslow, Winnipeg.

Transferred, Associate Members to Members—E. G. Horne, Montreal; P. O. G. Jones, Toronto; Ibbotson Leonard, London; C. J. H. Townsend, Toronto; L. W. Klingner, Bagdad, Mesopotamia.

Transferred, Juniors to Associate Members—A. A. Anderson, London; H. G. Angel, Bassano, Alta.; C. M. Barnes, Buffalo, N.Y.; B. C. Berry, Toronto; P. R. Boese, Ely, Nevada; Fitzjames Bridges, London; B. M. P. John, Montreal; L. W. Deslauriers, Montreal; S. D. Fawcett, Ottawa; C. E. Fraser, Toronto; M. C. Garroni, Winnipeg; Walter Griesbach, Montreal; G. A. Jenkins, Portland, Oregon; S. R. Keemle, Chatham; A. J. Kelly, Montreal; H. F. Morrissey, St. John; C. B. Shaw, Iroquois Falls, Ont.; O. H. Shenstone, Toronto; R. H. Stenhouse, Ottawa; H. H. Vroom, St. Lambert, Que.

Transferred, Students to Associate Members—C. W. Boast, Richmond, Que.; E. C. Cowan, Winnipeg; C. H. Donnelly, Niagara Falls, Ont.; H. I. Dowling, Toronto; Alan Ferrier, Montreal; L. F. LEADING PROBLEMS NOW FACING CANADIAN CONSTRUCTION INDUSTRIES

Good Work Accomplished by Executive Committee — Subjects Discussed Included Apprenticeship, Code of Practice, Contract Documents, Purchasing Orders, Etc.

By J. Clark Reilly

Executive Secretary, Association of Canadian Building and Construction Industries

THE hard work of the pioneers in the formation of the Association of Canadian Building and Construction Industries is beginning to bear fruit. Following our Winnipeg Conference in January, 1921, the men in Manitoba, Saskatchewan and Alberta got together and formed a Western Branch, which will meet again in March. In the Province of Quebec a Provincial Association has been formed, fathered by D. K. Church and F. G. Brousseau. Branch associations have been formed at Port Arthur, Port William and at Prince Albert.

The Executive Committee has carried the burden of the work during the year, and has accomplished a great deal. Too much credit cannot be given to the members for the unselfish manner in which they have travelled to the meetings and conducted the association's affairs. It should be made public that, with one exception, the members paid their own expenses, both railroad and hotel, not only when attending Executive Committee meetings but also at meetings of the Joint Conference Board.

The following meetings of the Executive were held: March 2, at Ottawa; March 15, at Toronto; April 28, at Montreal; May 11, at Toronto; June 21, at Toronto; September 15, at Montreal; November 2, at Hamilton; and December 13, at Toronto. Messrs. Anglin, Carswell and Grieve attended eight meetings, Mr. Pigot seven, Mr. Matice four, and Mr. Whitlock one. The western members of the Executive have been kept constantly in touch with the work done, and have rendered valuable assistance by suggestions through correspondence.

At the conference in Winnipeg a number of questions were sent forward to the Executive for action, and these have been dealt with, so far as was possible under conditions existing in the industry during the year.

It was not found practicable to employ an associate secretary to devote his time to the interests of the manufacturing and supply section, and the trade contractors' section, owing to the lack of the required funds. Stenographic assistance was given to the secretary, however, and a separate office obtained and suitably furnished.

The question of housing, acted on by resolution at Winnipeg, has been carried forward by the Executive to the Government, but the difficulty of financing such a scheme proved to be the stumbling-block in the way of its success. The need still exists.

The National Joint Conference Board, of which last year's Conference approved, has held five meetings, as follows. The first in Ottawa, March 2 and 3; second, third and fourth during the Joint Conference in May; fifth in Ottawa, delayed meeting from December, held January 10. The recommendation regarding financing this Board has not as yet been acted upon, our members continuing to pay their own expenses.

A Joint Conference in the building and construction industry of Canada was held at Ottawa, May 3 to 6, on the invitation of the Minister of Labor, who acted at the suggestion of the National Joint Conference Board. Some thirty-two employers' delegates from all parts of Canada met a similar number of representatives of organized labor.

Apprenticeship is still a question on which but little practical results are apparent in the working out of the schemes proposed for National and Local Councils, and also in the actual signing on of boys for the trades in the industry. The foundations have been laid, however, and when conditions improve the need of apprentices will be more strongly felt than ever.

The resolutions of last year's Standard Practices Com-

mittee were sent out to branch organizations throughout the country, and have been discussed and acted upon in some places. There does not seem to have been any very special enthusiasm over establishing rigid Codes of Practices, and yet difficulties constantly arise in the relations of general contractor and sub-contractor, and of both to the supply-man.

Representations were made to the Dominion and Provincial Governments in regard to the re-imbursment of contractors who had suffered loss owing to war conditions, and also in reference to the resumption of public works to relieve unemployment.

Joint consideration, with the Executive Committee of the Ontario Provincial Association, was given to the question of the Ontario Lien Law, and other legislation affecting our industry coming before the provincial legislature.

The standard contract documents approved at last conference have been placed before the Royal Architectural Institute of Canada and the Engineering Institute of Canada, for their approval, but these bodies apparently do not wish to take action at present. Copies have been typewritten and distributed on request, and the General Conditions and Straight Contract have been used on some large contracts, and found practical and satisfactory.

It has also been suggested that we might consider some standard form of bulk purchasing order, this being in the nature of a contract form.

The association was represented by the president at the annual meeting of the Employment Service Council of Canada, at which the question of unemployment was the principal subject under discussion. The Dominion Government, in conjunction with the provincial governments and municipal authorities, is carrying out some of the suggested plans of the board. There is still a great measure of unemployment in the large centres of Canada, and as an association we should give the most careful consideration to this very pressing problem.

The question of freight rates is still with us. Some relief has been given to conditions by the reduction allowed by the Board of Railway Commissioners, but there remains much to be said and done in regard to the rates on heavy commodities, in which the construction industry is so directly concerned.

The time of the secretary during the year has been very fully occupied in carrying out the work laid down by the Winnipeg Conference, the Executive Committee, and the new matters which seem to keep constantly arising. Every effort has been made to keep expenses as low as possible, and this has been a difficult matter in view of the high costs of printing, stationery and other necessary materials. In addition, there has been a great deal of further work arising from the sessions of the National Joint Conference Board and the Joint Conference in May last, and this has been done by the secretary.

Conditions have not permitted any extensive travelling for organization purposes, the trips taken by the secretary being those necessary for attendance at meetings of the executive committee, and two others in regard to renewals of memberships in Montreal and Toronto.

It is to be noted that the branch organizations are making increasing use of the secretary in Ottawa to secure information from various offices of the Government, and this is also the case with individual members of the association. The secretary has tried to keep in touch with matters which have come up, affecting the interests of the association, both in the late session of the House and in the resulting application of the legislation.

One of the needs felt by the Executive and the secretary is the obtaining of statistics dealing with various questions which arise, and for which we have not the facilities.

There is still the necessity for the uniformity of legislation in the various provinces of Canada. This is especially true of the Workmen's Compensation and the Lien Acts.

Speaking generally, the year 1921 has been a very notable one for building and construction in one respect at least. The attention of the various governments, the press,

the pulp and the public has been directed very intensely towards the industry, both in the United States and Canada. This has been due in a large extent, to the widespread publicity given to three outstanding reports, viz., the Lockwood Inquiry in New York City, the Report of Judge Landis in Chicago, and what is known as the Hoover Report on the Elimination of Waste.

Through these reports, and the resulting discussion and other more direct and practical effects, public interest has been aroused in practically all of the great questions which we have had before us. The causes for the high cost of labor and materials, the shortage of housing, the seasonal character of the industry, the tightness of money, the attitude of labor organizations, the results of agreements between employers and organized labor, the causes of waste, and the need for greater stability and standardization have all been under discussion.

The Hoover Report contains some clauses which are very striking, and which may be found applicable to Canadian Conditions:

"Waste, it is said, is causing huge losses in building, which, including all trades and labor incidental to it, ranks second among the industries."

The chief sources of waste in the building industry are irregular employment, inefficient management and wasteful labor conditions. Customs or conditions prevailing throughout the industry and poorly designed equipment are given as secondary causes."

"A striking fact about the building industry is that inasmuch as small buildings require so little capital and credit, and apparently so little technical ability, the field is full of small contractors, many of whom operate for a few years, and then fail."

"Wasteful labor regulations, according to the report, consist of requiring skilled men to do work which could be done by unskilled, restricting individual incentive through requiring uniform wages, limiting the number of apprentices, excessive reduction of working hours, restricting output by prohibiting the use of labor-saving devices, and jurisdictional regulations."

The responsibility in which we share is well emphasized by the following clause in the general manager's address, at the recent annual meeting of the Canadian Bank of Commerce:

"The excessive cost of building operations has made it impossible up to the present time to embark on an operation of such magnitude as is necessary to meet our requirements. In this connection it may be pointed out that in all parts of Canada there is a large program of building in prospect, the carrying out of which only awaits more stable conditions in the form of lower prices for material and labor and a return to efficiency."

The past year has been a time of difficulty and uncertainty, but it is our business to face the future with confidence, and do our utmost to solve the problems, and bring about a return of those conditions which will mean a revival of activity in our industry.—From annual report presented January 17 at the Conference of the Association in Hamilton, Ont.

GEORGIAN BAY CANAL ADVOCATED

WHILE the project to provide a great international channel for ocean-going ships by improving the St. Lawrence river to the Great Lakes is being studied by the government of Canada and the U. S., proponents of an alternative plan, the proposed Ottawa and Georgian Bay canal, are seeking to enlist support for their all-Canadian waterway.

Advantages claimed for this route over the St. Lawrence ship canal include its position entirely within Canadian territory, its immunity from the storm hazards of the lakes and the savings it offers in mileage.

According to reports of Canadian government engineers who have made an exhaustive study of the project, the Ottawa and Georgian Bay canal scheme is practicable.

As surveyed, the canal would follow the St. Lawrence from Montreal to the junction of the Ottawa and St. Lawrence rivers; there the Ottawa would be followed to Mattawa and Lake Nipissing and the French river would provide outlet from the Ottawa river to Lake Huron.

The length of the canal would be 440 miles with a lockage of 758 feet, the number of locks being 27 with lifts ranging from five to 50 feet. The size of the locks would be uniformly 650 feet in length, 65 feet clear width and 22 feet depth. Twenty-two feet would be the maximum depth on the entire length of the waterway. This waterway would consist of 28 miles of canal proper, 66 miles of improved river navigation and 346 miles of river and lake varying in width from 300 feet to half a mile.

As in the case of the proposed St. Lawrence-Great Lakes scheme, power development is planned. Government engineers have estimated that on the Ottawa and French rivers it will be possible to develop 1,000,000 horsepower. The power developed at the famous Chaudière falls at Ottawa, already the centre of large industrial operations, would be doubled.

Under the Ottawa and Georgian Bay scheme, vessels of twenty-foot draft, or 15,000 tons displacement, would ply between Montreal and Lake Superior ports. Advocates of the plan argue that this would make for increased inter-provincial trade, as Nova Scotia colliers might take their cargoes 1,000 miles into the interior from Montreal and load cargoes of grain and other interior products for the return voyage.

INCINERATORS DISCUSSED BEFORE THE TORONTO BRANCH, E.I.C.

AT THE meeting of the Toronto branch of the Engineering Institute of Canada, January 26, R. R. Knight, of Francis Hankin & Co. addressed the branch on "Incineration," or the practice of destruction of garbage by heat. A large number of lantern slides were shown to explain the various types of equipment used.

The desirability of utilizing the fuel value of garbage to bring about its own destruction was stressed by the speaker. An average of about one-fifth of a ton of garbage per capita per annum may be expected from a large community, and since one pound of garbage may be considered as capable of evaporating one pound of water in addition to the three-quarters of a pound present in the garbage, the heat value of this material is evident. The speaker stated that it possessed about one-quarter of the calorific value of poor coal.

Mr. Knight expressed the opinion that reduction of garbage for the utilization of various constituents thereof was impracticable for cities of less than 500,000 population. The destruction of garbage by incineration was also regarded as impracticable, without the use of added fuel, for cities of less than 15,000 population.

According to the speaker, there should be no nuisance experienced from well-managed incineration plants, especially in a city of appropriate size. Frequently these are placed alongside a public building, such as a hospital, and the heat derived from the combustion is used for the generation of power. At least 40 tons of garbage per ten hours should be available in order to make power development practicable.

Mr. Knight stated that an incinerator plant for a city of about 20,000 people would cost about \$30,000.

Complete statistics available show that during the fiscal year the Federal Department of Public Works spent \$20,970,674.31, of which \$1,217,892.07 is charged to demobilization. As compared with the total for the previous year, even with a reduction in the war expenditure of over \$3,000,000, there is an increase of \$15,214.46, due principally to the expenditures made on harbor and river works at Courtney Bay, St. John, N.B., Toronto, Fort William and Port Arthur, and Esquimalt, B.C.

HEAVY TRUSSES USED IN NEW YORK STOCK EXCHANGE EXTENSION

Interior of Twenty-four Storey Building Carried on Four Trusses Weighing One Hundred and Fifty Tons Each
— Ingenious Method of Erection

A VERY difficult piece of engineering was successfully carried out recently in the addition to the New York Stock Exchange. The new building is twenty-four storeys high and situated north of the present eight storey structure. When designing the extension the architects imposed unusually severe demands on the structural engineer by suppressing an entire storey of interior supports and asking him to carry more than twenty storeys over a large hall. This was accomplished by using four very heavy trusses weighing about one hundred and fifty tons each.

Due to the importance of the lower floors it was found necessary to raise the trusses up to the space between the fifth and sixth floors; the third floor and fourth, or mezzanine floor, being hung from the lower chord of the truss. The sixth floor frames into the top chord and the fifth into the bottom chord of the truss making a distance of 15 ft. 10 in. between centres of chords. The size of the supporting columns and the spread of the foundations made it necessary to keep these columns further back from the wall than the upper exterior columns. To do this the end posts of the trusses were inclined outward, the end panels thus forming a cantilever on which are carried the upper wall columns.

The columns and the main truss members are similar in design. They are made up of a 14 in. 287½ lb. Bethlehem H-section, being the web of the member, with three 24 x ¾ in. plates on each side. Where heavier members were required 8 x 6 x ¾ in. angles and filler plates were added. The heaviest member was composed of 1-14 in. H @ 287.5 lbs., four angles 8 x 3½ x ¾ in., eight angles 8 x 6 x ¾ in., two plates 8 x ¾ in., two plates 41 x ¾ in., four plates 34 x ¾ in. and two plates 34 x ¾ in. The main truss members were made with 1½ in. rivets and other minor connections with 1 in. rivets.

The erection of these heavy trusses at such a height was a very difficult task but it was ingeniously accomplished by using the steel work for the upper part of the building. Beams and columns designed for the upper stories, were used up to the ceiling of the large hall and above this point the hangers for the third and fourth floors were erected and used as columns to support the bottom chord which was erected in its permanent position. The floor framing was then put in and used as a platform to erect the rest of the truss after which the temporary steel below the third floor level was removed. The heaviest unit to be handled was the main section of the top chord which weighed 53 tons. The total weight of structural steel used was about 5,660 tons and the trusses are probably the largest ever used in office building construction.

WOULD INCREASE DIVERSION AT NIAGARA FALLS

BY way of explanation of a recent statement that an application by American interests was before Congress to have 100,000 cubic second feet of water diverted from the Niagara river above the falls, Sir Adam Beck says that at present Canada, by treaty, is entitled to 36,000 cubic feet per second. The United States is permitted to take 20,000 cubic feet per second. The total diversion to-day is 56,000 cubic feet second. The proposal now being made is to increase the diversion to 100,000 cubic feet second, an increase of 44,000 c.f.s. Of this, Canada would get 22,000 c.f.s., and the United States 22,000 c.f.s.

Hitherto the Americans have talked of making an equal division of all water taken from the falls, including the increased diversion, and this Canada was prepared to fight strenuously, as the existing division of water favoring this country was due to the United States getting a large quantity of water from the Great Lakes for the Chicago

drainage canal. Were the equal basis followed, Canada would get only 14,000 c.f.s. of the increased diversion and the United States 30,000 c.f.s.

Canada's share of 22,000 c.f.s. of the increased diversion would produce more than 600,000 horsepower of electricity, the maximum capacity of the Chippawa Canal if carried through the canal to Queenston. Canada is still wasting about 4,000 c.f.s. of its present allotment and with that water and a new interpretation of the treaty, sufficient water to operate the Chippawa Canal to maximum capacity could be obtained without the proposed new diversion, Canada's consent to the increased diversion has to be secured.

TESTING EFFECT OF ALKALI ON CONCRETE

IN AN address at the annual convention of the Saskatchewan Agricultural Societies Association Walter C. Murray, president of the University of Saskatchewan drew attention to the research being conducted at the University of value to the farmer. There were for instance, experiments being conducted in the matter of the effect of alkali on concrete, which were being carried out by the members of the science faculty. If a solution were found to the problem of the destruction of concrete by alkali it would mean the saving of millions of dollars annually in the west. Much progress had already been made and it had already been discovered that the question was one of chemical, not of physical, effect. Numerous experiments had already brought out the fact that the quality of concrete was not an element in the question.

PHONE COMPANIES PLAN YEARS AHEAD

TELEPHONE company engineers plan from fifteen to twenty years ahead in installing equipment, with the result that it is seldom necessary to dig up a conduit to increase its capacity. This was one of the interesting statements made to members of the Montreal Branch of the Engineering Institute of Canada by N. M. Lash, chief engineer of the Bell Telephone Co., in an address at a meeting held recently in Montreal.

Because telephone systems grow the cost per unit of giving service does not decrease, the speaker said. As more subscribers are added more intricate and expensive equipment is required and costs go up. He dealt with the subject of the long-distance telephone system, stating that the open wire will soon be replaced by wires in cable to care for heavy demands. The actual productive talking time on long distance was also discussed, and it is said that the time is constantly being increased as a measure of economy and operating efficiency improved, but each advance along these lines called for bigger expenditure on new equipment.

The annual meeting of the Ontario Good Roads Association will be held in Toronto, March 1, 2 and 3.

The Illinois section of the American Waterworks Association, of which G. C. Habermeyer is secretary, will hold its 14th annual meeting at Urbana, Ill., on March 23 and 24.

We desire to call our readers' attention to an error which appeared in the January 24 issue of "The Canadian Engineer." In the report of the Canadian Building and Construction Industries Convention at Hamilton, on page 164, reference was made to several reels of industrial films exhibited by the Austin Mfg. Co. This should have read the Austin Machinery Corporation of Chicago, makers of the well-known Austin cube mixers and road building machinery. We might add that this line of machinery is made in Canada by the Canadian Austin Machinery Co., at Woodstock, Ont.

LUMBER PRICES ARE INCREASING

THROUGHOUT the year 1921, although the general tendency of the wholesale lumber market was downward, the principal construction woods—yellow pine, North Carolina pine and Douglas fir—held fairly firm and the prices in eastern market centres today are virtually on the same level as they were at the beginning of 1921, according to A. R. Kriebbaum, vice-president of Lumber, who attended the convention of the Canadian Lumbermen's Association, at Toronto.

In reviewing the year's market, Mr. Kriebbaum pointed out that the market was on a downward trend when the year opened and this decline continued, almost without interruption, until about October 15. Then buying was resumed on a fairly large scale and prices began to climb slowly, continued upward until December 1st, when they struck an even keel, and have remained about that level ever since. In the hardwood department, however, the advance did not begin until late in November, and hardwood prices today are still rising.

Heavier Demand and Higher Prices

While the contemplated demand during the spring and summer will undoubtedly result in the stiffening of prices, the advance is not expected to be very rapid, and certainly prices will not even approach the peak level of 1920. To again reach such an abnormal level would not be to the best interests of the lumber industry or the public at large, and the lumber producers and wholesalers themselves full realize this.

Competition for business will be keener in 1922 in the lumber business as it will in all other lines of industry and this will tend to hold values to a reasonable level. It should be remembered, however, that for more than a year the lumber producers have been selling their products at very little profit and in numerous instances below cost of production. The volume of business for 1921, taken as a whole, was small and many mills have been closed down for months. To resume operation and re-enter the market, these mills must be assured a reasonable price for their lumber. Otherwise they will remain shut down.

The conclusion which at present seems definite, therefore, is that the wholesale price of lumber in the east today is considerably lower than it will be sixty and ninety days hence. The construction lumber market is bound to advance above its present level, and the hardwood market is already advancing.

VICTORIA HARBOR ASSOCIATION ISSUES REPORT

THE annual report of the Inner Harbor Association of Victoria, B.C., which has just been issued, gives some interesting information regarding the improvements which have been carried out and which are still being made. It states that about 3,000,000 cubic yards of rock, hard pan, mud and gravel have, so far, been removed from the navigation channel, at a cost of \$1,500,000. The work of deepening the turning basin, involving the removal of approximately 100,000 yards of clay and rock is now in progress, as well as the removal of shoal spots in the fairway west of Songhees Point, so as to maintain the harbor grade to twenty feet below low water mark.

The old tortuous entrance to the Inner Harbor has been straightened and widened from Hospital Point westward, forming a channel with a minimum width of about six hundred feet, and twenty feet deep at zero low water. This great work of development is now being followed up by continuing the removal of Hospital Rock, which has always fouled a large area of water on the east side of Songhees Point.

The southerly approach to the new Johnson Street bridge has recently been improved by the removal of the easterly portion of Discovery Rock, which abutted into the channel, and the approach at this point has been made clear.

The Dominion Government has built and completed the breakwater and docks at Ogden Point, and is now building

the drydock at Skinners Cove, Esquimalt, at a cost of \$4,300,000. This dock will, when finished, increase the importance to shipping on the Pacific Coast of this port.

NEW BRUNSWICK ENGINEERS ELECT OFFICERS

THE annual meeting of the Association of Professional Engineers of New Brunswick was held on Jan. 27 in the Board of Trade rooms, St. John, N.B. Reports were received from the various officers. The council report showed that the association has a membership of 179. C. C. Kirby, retiring president, gave an interesting address. The election of officers was held and resulted as follows: President, S. B. Wass, Moncton; vice-president, C. C. Kirby, St. John; secretary, J. A. Waring, St. John; Councillors, St. John District, F. P. Vaughan and H. F. Bennett; Moncton District, J. D. McBeath, Moncton, and K. S. Pickard, Sackville; Fredericton District, B. M. Hill; Chatham District, R. J. Sly.

NEW YORK COMMISSION OPPOSES ST. LAWRENCE PROJECT

A COMMISSION appointed by Governor Miller of New York to oppose the Great Lakes-St. Lawrence River waterway project has filed with the Legislature its second report. This was divided into two parts. First, a memorandum of the commission based on the report of the engineers, and, second, the address of Governor Miller before the Atlantic deeper waterways convention at Atlanta, Ga., last November.

In its memorandum the commission opposes the St. Lawrence project on the grounds that:

Plans and estimates of engineers for the St. Lawrence improvement from Montreal to Lake Ontario are preliminary only, and that the data submitted is not sufficient to indicate that the work can be done for the amount stated.

New York State will not voluntarily surrender its vested rights in the water power along the St. Lawrence.

Whatever water power is available belongs to the State of New York and the Provinces of Quebec and Ontario, and that neither the Dominion of Canada nor the United States Government can lawfully appropriate them without compensation to the owners.

In order to produce 4,100,000 horsepower and a 25-foot channel, the United States and Canadian Governments will have to spend more than \$488,000,000; for a 30-foot channel, with the same amount of horsepower developed, the cost will exceed \$506,000,000.

Operation of the waterway will be hampered by ice and flood conditions.

It is unwise for the two Governments to tie up their natural resources in such a project.

New York State protests against the use of the potential property interest of the state in the undeveloped St. Lawrence River waterpower for the financing of the plan under consideration.

The expenditure by the United States of the money necessary to make the St. Lawrence River navigable for ocean-going vessels of 25 or 30-foot draft is not justifiable.

An outstanding improvement in the operation of Canadian railways was registered in October, 1921, when, in spite of decreased freight and passenger business transportation, expenses were cut \$4,896,904, or 21 per cent. over the previous month, according to information issued recently by the transportation branch of the Dominion Bureau of Statistics. The Canadian Northern, Canadian Government and Grand Trunk Pacific Railways all showed marked improvements in their operating ratios, and for the first time in two years, instead of expending from one to two dollars in operating expenses alone in order to earn one dollar, these roads expended 90.6, 92.7 and 94.4 cents respectively, for each dollar earned. The C.P.R. showed the lowest operating ratio this year, namely, 69.56 per cent, as against 69.46 per cent. for October, 1920.

LAKE OF THE WOODS CONTROL CONTROVERSY GROUNDLESS

IN A recent issue announcement was made of the promulgation in the Canada Gazette of regulations covering the mode under which the Lake of the Woods Control Board must regulate the levels of the Lake of the Woods pursuant to the Lake of the Woods Regulation Act passed at the last session of Dominion Parliament. The question of adequate provision for the best use of the Lake of the Woods waters to meet the needs of all interests on both sides of the international boundary, which a few months ago tended to become a violent political controversy, would appear now happily to be in a fair way to satisfactory and permanent settlement.

So far as the physical or engineering problems involved in the whole question are concerned, and they have been exceedingly complex and have taxed the ability of leading engineers in both countries, there never has been real difficulty in reaching a solution which would meet the practically unanimous approval of all the engineers concerned. When, however, attempts were made to put into actual effect the provisions for the carrying out of the solutions agreed to as feasible and advisable from an engineering standpoint, legal impediments incident to conflicting international, federal, provincial and state rights became so pronounced that those in most intimate touch with the issues have despaired of ever reaching a conclusion which could be made acceptable to the governments of Canada and the United States as the basis for a treaty settling permanently all the matters arising from the Lake of the Woods reference. Especially was this so when an unnecessary conflict of opinion arose between the Dominion government and the Ontario government as to the modus operandi for furnishing the control of the levels and the out-

flow of the Lake of the Woods within the limits of the range recommended by the International Joint Commission, and which was conceded to be a matter entirely for appropriate action by competent Canadian authority.

Strange to say, both the governments at Ottawa and Toronto were in complete accord as to the main purpose and even the general method of securing such control, but largely because of the resistance of certain interests at the outlet of the Lake of the Woods, the Ontario Government was forced to recede from the scheme agreed to with the Dominion government to provide by joint and concurrent legislation for a Lake of the Woods Control Board. Upon the failure of the co-operative scheme, the Dominion government decided, largely upon the urge of the government of Manitoba, to bring down the Lake of the Woods Regulation Act, which, by invoking the "general advantage" clause of the British North America Act, furnished the requisite authority for providing precisely that species of control contemplated by the previously agreed to concurrent and conjoint legislation of Parliament and Legislature.

It has been publicly stated that the Dominion legislation went further than was absolutely necessary, when the "general advantage" clause was applied to the control of the levels and outflow of Lac Seul, an important body of navigable water which is not international, and therefore in an entirely different category from the Lake of the Woods. There would, however, appear to be justifiable reason for the inclusion of Lac Seul under similar control to that of the Lake of the Woods. It certainly has a very direct and under conceivable circumstances, a dominant bearing on the regulation of the waters of the Winnipeg river. Indeed it would be very easy for an unsympathetic or antagonistic private purpose plant to be set up on the English river involving control of the outflow of Lac Seul waters in such a way as to destroy entirely the beneficial effect of the dependable flow furnished from the Lake of the Woods.

In such case, power developments on the Winnipeg river in Manitoba would be menaced to a degree which would react to the permanent disadvantage of a vast and important key industry for the whole province of Manitoba. Plants of the city of Winnipeg, the Winnipeg Electric Railway Co. and the project now under way of the Manitoba Power Co., involving capital expenditures of nearly \$20,000,000, and many times that amount of directly dependent capital outlays, would be placed in an impossible position and their proprietors might be forced to pay unjust toll to the private purpose plant controlling the outflow of the English river. No government either of the Dominion or of the provinces of Ontario or Manitoba could, under any conceivable circumstance, permit such a condition of affairs. Therefore, it would appear that it was a justifiable and timely move on the part of the Dominion government to include Lac Seul within the purview of the Lake of the Woods Regulation Act. As this Act provides a means for its withdrawal upon the passing by Ontario of its joint concurrent legislation, there is a very definite and simple means of solving the whole control problem.

It is understood that shortly after Royal assent was given to the Lake of the Woods Regulation Act, the Meighen government re-appointed thereunder the original Lake of the Woods Control Board, which was constituted by Order in Council on 21st January, 1919, by and with the consent of the Ontario Government. "The Canadian Engineer" is informed that this Board is now functioning satisfactorily and that the regulations recently promulgated were prepared for and recommended to the Dominion government by it. The board should now be in a position to provide that regulation which representatives of the governments of the Dominion and of the Provinces of Ontario and Manitoba were at one time in unanimous agreement about. So far as the international aspect of the whole problem is concerned, we are advised that the recommendations of the International Joint Commission have been formally accepted by the governments of Canada and of the United States in a general way, but that certain minor

amendments made necessary by investigations since the Commission's findings were completed in 1918 are now the subject of international negotiations. It is confidently expected that in the near future these negotiations will reach a stage where it will be possible for a complete agreement to be reached upon which a treaty or convention can be based. It would therefore appear that the report and recommendations of the International Joint Commission on the Lake of the Woods reference matter, will in due course be given effect to in a permanent way by the governments of Canada and the United States. An active international controversy of long standing and fruitful of real trouble to both countries will then have been composed by the good offices of the Commission.

PERSONALS

F. J. Ure, C. E., town engineer of Woodstock, Ont., has been appointed engineer and surveyor for East Zorra Township.

W. H. FERRIS, Reeve of Harrow, Ont., has been appointed chairman of the highway committee of the Essex County Council.

DR. W. H. SUTHERLAND, M.P.P., in the provincial legislature has been appointed Minister of Public Works for British Columbia.

S. L. SQUIRE, chairman of the executive of the Canadian Good Roads Association has returned to Toronto from Victoria, B.C., where he has been making arrangements for the annual convention of the association to be held in Victoria on June 13-16.

W. O'BRIEN, of the Canadian Bridge Co., Walkerville, Ont., has arrived in Victoria, B.C., and will direct operations on the construction of the highway section of the Johnson St. Bridge. Mr. O'Brien, who is a well-known bridge engineer, was superintendent of construction of the south end of the Quebec bridge.

FRED J. WOLFE, who at the annual meeting of the Imperial Oil Company held a few weeks ago was elected to the directorate has been a member of that organization for more than twenty years, having begun his business career as junior clerk in the office of the Queen City Oil Co. in Toronto, 1901. In 1904 Mr. Wolfe was placed on the sales

staff and his ability and energy were soon recognized and he was made city agent for London, Ont. In 1905 he moved back to Toronto to occupy the position of assistant to J. P. Rogers who was at that time manager of the lubricating branch of the Queen City Oil Co. In 1914 Mr. Wolfe became assistant sales manager for Ontario and in 1918 was made sales manager of the Western Ontario District. He remained there until

1920 when he was transferred to Montreal and took charge of the sales of the province of Quebec. In 1921 he was appointed general sales manager in the Toronto office of Imperial Oil Co., Ltd.

A. E. DOUCET, director of public works, city of Montreal, has written a letter to the executive committee asking that his resignation be accepted, to take effect, Feb. 1. Mr. Doucet was appointed to the position of Director of Public Works during the late administrative commission's regime. During his term of office many improvements in civic service were inaugurated.

OBITUARIES

C. HOWARD ELLIS, of Ellis & Ellis, architects, Toronto, died in that city on January 27, aged 37.

HENRY H. MARSH, contractor of Grimsby, Ont., died in Hamilton on January 27. Mr. Marsh was born at Winona, Ont., 63 years ago.

GEORGE EDWARDS, 80 years of age and said to be the oldest living science graduate of McGill University, was accidentally killed recently at Cold Lake, Alta., where he was engaged in the lumbering business.

NEW PUBLICATIONS

REPORT OF THE MINISTER OF PUBLIC WORKS for the Province of British Columbia year 1920-1921. The report contains one hundred and eighty pages of detailed information regarding the public works carried on by that department together with a number of interesting plates illustrating the various works.

IROQUOIS ASPHALT PAVING MACHINERY. This brochure contains interesting descriptions together with illustrations of the various machines produced by the Iroquois Department of the Barber Asphalt Company including asphalt mixing plants of the semi-portable and stationary types, melting kettles, road rollers. The brochure is very nicely illustrated and printed on heavy coated stock.

CONCRETE WORK. Vol. 2 — By William Kendrick Hatt, Professor of Civil Engineering, Purdue University, Lafayette, Ind., and Walter C. Voss, head of the department of Architectural Construction, Wentworth Institute, Boston, Mass. Published by John Wiley & Sons, Inc., New York; Chapman & Hall, Ltd., London. 206 pp; 5 1/4 by 7 1/4 in.; 37 figures; cloth; \$2.25 postpaid. Reviewed by H. S. Van Scoyoc, Manager of Publicity, Canada Cement Co., Ltd., Montreal. This book is a companion publication to Vol. 1 by the same authors reviewed in these columns May 5, 1921. The two volumes are inter-dependent, Vol. 1 being a reference book for Vol. II. They are a unique contribution to the literature of concrete in that they include much of the information usually sought for in a handbook, much detailed information usually associated with a reference book, and a very definite treatment of practical problems arising in actual concrete building construction.

They do not replace the text books used in engineering schools but will be of great assistance in the secondary schools giving instruction in concrete work in their manual training departments. They will be of greater value to the ambitious employees of contracting firms who are interested not only in what they are doing but also in the principles underlying the methods that are followed.

The material included is really the outgrowth of the instruction given concrete workers in the vocational detachments of the United States Army at Purdue University during 1917-1918. It has had an intensive trying out and brings into an unusually compact form the accepted methods for testing the materials entering into concrete work, the construction of forms, methods for mixing and placing concrete, some basic problems in reinforced concrete design and detailed methods for the actual construction of sidewalks, concrete products and the simpler building units. Prof. Hatt has taken full advantage of his close association with the various technical and trade societies interested in concrete work and the books reflect the very latest information available on the subjects discussed.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

Construction news items, including notes of various tenders called, are published on pages 44 to 50 of this issue. The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported on the above-mentioned pages. The word "Issue" refers to the issue of "The Canadian Engineer" in which there appeared a notice giving some details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Edmunston, N.B., construction of a school building	Feb. 8	Jan. 31
Toronto, Ont., miscellaneous work on several schools	Feb. 8	Jan. 31
Ontario, Province of, Work on Provincial highway, Township of Ameliasburg ..	Feb. 10	Jan. 17
Victoria, B.C., fabrication and erection of part of the superstructure of Johnson Street bridge	Feb. 13	Jan. 17
Ontario, Province of, supply of Portland cement	Feb. 14	Jan. 24
Cap de la Madeleine Que., supply of pumping equipment	Feb. 13	Jan. 31
Kitchener, Ont., purchase and removal of brick buildings	Feb. 13	Jan. 31
Hespeler, Ont., erection of a public library building	Feb. 21	Jan. 31
Ontario, Province of, expansion joint material	Feb. 21	Jan. 31
Huntsville, Ont., construction of pavement	Mar. 1	Jan. 31
Ontario, Province of, construction of pavements, culverts, grading, etc.	Mar. 6	Jan. 31

BRIDGES, ROADS AND STREETS

Alberta, Province of.—Premier Greenfield told a delegation from the Canadian Good Roads' Association, which waited on the cabinet recently, that the Alberta Government would make every effort to take advantage of the Federal grant of \$1,500,000 for the building of highways in the province.

Brantford, Ont.—The estimated expenditure on roads in Brant county this year has been set by the County Council at \$275,000. Road Superintendent, A. M. Jackson, Brantford.

Calgary, Alta.—Plans and specifications are being prepared for the construction of a bridge over the C.P.R. irrigation ditch on Seventeenth Ave. east. City Engineer, George W. Craig.

Charham, Ont.—A tentative promise to pave seven miles of Provincial Highway in Kent County this year was made by Hon. F. C. Biggs, Minister of Public Works and Highways, to a deputation from here recently.

Galt, Ont.—The estimate of Waterloo County Council this year for road construction is \$300,000. Road Superintendent, L. S. Lichty, Wellesley, Ont.

Guelph, Ont.—The City Council intends to construct concrete pavements on the following streets: Metcalfe, Alice and Queen. Total estimated cost, \$59,754.50. City Clerk, H. J. B. Leadlay.

Hamilton, Ont.—The City Council passed the by-law for the extension of the Mountain roadway to James St., which was approved by the ratepayers recently. City Engineer, E. R. Gray.

Kingston, Ont.—The City Council has decided to open Mack St. to Regent St. City Engineer, Howard S. Dick.

Kingston, Ont.—Frontenac County Council plans to expend \$109,700 on roads this year. Road Superintendent, R. H. Fair, R. R. No. 5, Kingston.

Lindsay, Ont.—Victoria County Council awarded the contract to Frank King, of Lindsay, for the removal of approximately 2,000 cu. yds. of solid rock and other work at Fenelon Hill. Eight tenders were received, ranging from \$4,450 to \$8,737.50.

Ontario, Province of.—A delegation from the Niagara district municipalities will have a conference with Hon. F. C. Biggs, Minister of Public Works and Highways, regarding the commencement of the work on the Hamilton-Niagara Highway at an early date.

Ottawa, Ont.—Authorization for the borrowing of a half million dollars for the construction and maintenance of good roads, and for current expenses, was granted Carleton County Council recently. County Road Supt., Samuel McClure, Galetta, Ont.

Owen Sound, Ont.—It is proposed to build a bridge over the harbor in order to connect up the C.P.R. tracks to provide interswitching facilities. Both railroads are opposed to the scheme, but the city is in favor of it. The whole matter will shortly come up before the Railway Commission. Three schemes have been proposed, the most feasible being a bridge north of 10th Street, which will cost about \$40,000.

Quebec, Province of.—Work may soon be commenced on the construction of the Ile Perrot bridges, the western from Vaudreuil to Ile Perrot and the eastern from Ile Perrot to St. Anne de Bellevue. The Provincial Government has already voted \$600,000 for this work and the Dominion Government has agreed to contribute \$150,000. The Vaudreuil-Ile Perrot bridge will probably be of reinforced concrete and the St. Anne de Bellevue-Ile Perrot bridge of steel construction.

St. Thomas, Ont.—Elgin County Council has estimated its share of county road expenditures for 1922 at \$75,000, with the possibility of the amount being increased in June, if the construction program is enlarged. The sum of \$20,000 will be spent for road construction, \$35,000 for maintenance, \$10,000 for culverts and bridges, \$5,000 for gravel pit development, and \$5,000 for machinery. Road Superintendent, Frank Pineo, St. Thomas.

Sandwich, Ont.—Essex County Council passed a by-law authorizing the borrowing of \$400,000 for road construction during the year. Road Superintendent, W. H. Kinster, Sandwich.

Sandwich, Ont.—A by-law was passed by Essex County Council authorizing the borrowing of \$400,000 to expend on county road building this year. Road Superintendent, W. H. Kinster, Sandwich.

Sarnia, Ont.—A by-law was introduced at a recent meeting of Lambton County Council to provide for the building of 1½ miles of concrete road on the 16th sideroad of Sombra Township, the estimated cost being \$40,000. County Road Supt., John McCallum, Alvinston, Ont.

Toronto, Ont.—The City Council intends to extend and grade Edgewood Ave. at an estimated cost of \$11,750.

Toronto, Ont.—The City Council proposes to acquire lands for the extension of Simpson Ave., from Logan Ave. to Carlaw Ave.

Toronto, Ont.—The Transportation Commission asked the Board of Control to provide a temporary bridge on Gerrard St. during the construction of the proposed high-level bridge over the Don.

Toronto, Ont.—The Works Committee recommended the adoption of the report of Works Commissioner Harris for the construction of an asphalt pavement on Chestnut Park Road at a cost of \$49,989.

Toronto, Ont.—Works Commissioner Harris has recommended the construction of curbs on the following streets; Burgess Ave., Kenilworth Ave., Glenmount Park Dd., Glenlake Ave., Patricia Road, Belhaven Road, and Battenburg Ave.

Toronto, Ont.—Works Commissioner R. C. Harris has recommended the construction of pavements on the following streets; Glenlake Ave., \$20.079; lane 1st west of Markham St., \$6.009; lane 1st east of Sacville St., \$2.057; lane 2nd south of College St., \$2.508. Also the following cement concrete sidewalks; Lawler Ave., \$5.222; Lawton Ave., \$12.42; Oriole Gardens, \$1.161; Pince Crest Road, \$2.857; Strathmore Blvd., \$4.417; Windermere Ave., \$3.233.

Toronto, Ont.—Additions to the York County good roads system are under consideration by York County Council. The following sections are proposed: Kipling Avenue, New Toronto, from the Toronto and Hamilton Highway to the G.T.R., $\frac{1}{2}$ mile; Vandorf Road, $\frac{1}{2}$ mile to Vandorf Village and to G.T.R. Station, Albion Road, from Thistletown to Peel County Good Roads; Dufferin Street, from the city limits to connect with Vaughan Road; Queen Street east, to be connected with Kingston Road, 3,000 ft.; Sharon Road, $2\frac{1}{2}$ miles, to connect Holland Landing with Sharon also simultaneously to connect Simcoe and Ontario systems and avoid a seven mile detour.

Victoria, B.C.—The Canadian Bridge Co. of Walkerville, contractors for the highway section of the Johnston St. Bridge are assembling equipment and a considerable portion of the steel that will be required is already on the ground. W. O'Brien is in charge of the work.

Whitby, Ont.—The expenditure of Ontario County Council for good roads in 1922 will total \$88,700. Road Superintendent, D. J. Kean, Whitby.

Whitby, Ont.—The route of the Whitby to Lindsay Provincial highway has been definitely decided upon and the plans deposited in the Registry Office here. Work will likely start in the spring.

York Tp., Ont.—The Township Council plans to extend Hillary Ave.

WATER, SEWAGE AND REFUSE

Chatham, Ont.—Mayor Harrington who recently visited Stratford to inspect the incinerator there, will report to No. 3 committee of the City Council on the practicability of constructing an incinerator here.

Kingston, Ont.—The City Council has decided to have sewers laid in Regent and Mack Streets. City Engineer, Howard S. Dick.

New Toronto, Ont.—An application is being made by the Municipal Council to the Ontario Government for approval of the construction of a sewer from Second St. to the eastern town line. Clerk, W. H. C. Millard.

Peterborough, Ont.—Waterworks Superintendent R. L. Dobbins in his report showed that by the commission laying its own pipes in connection with the filtration plant, over \$18,000 had been saved. Contracts for the plant were let for \$304,813, and to the end of December, \$219,936 was expended.

Port Credit, Ont.—On the advice of the Provincial Board of Health, the four lake shore municipalities west of Toronto—Port Credit, Etobicoke, Mimico and New Toronto—are working together to arrange for a common water system.

Toronto, Ont.—Tenders will be called for the construction of sewers in the Leslie gardens subdivision, estimated to cost \$40,000.

Toronto, Ont.—The Works Committee reduced the estimate of Works Commissioner Harris, amounting to \$2,021,000 for sewers, to \$500,000.

Toronto, Ont.—The Board of Control recommended that the proposed water works emergency station and storehouse at the northwest corner of Dundas St. and Hamilton

St., estimated to cost \$14,000, been erected by day labor under the supervision of City Architect Price.

Toronto, Ont.—The Board of Control awarded contracts to Angelo Cavotti for the laying and jointing of water mains in Woodington Ave., at \$1,143; Stratmore Boulevard, \$594.56; Wolverleigh Boulevard, \$590.60; Milverton Boulevard, \$588.12 and Glebeholme Boulevard, \$589.11.

Toronto, Ont.—Works Commissioner Harris has recommended the construction of the following sewers: Macpherson Ave., \$3,880; Foxbar Road, \$11,630; lane -st east of Sackville St., from Salisbury Ave. to Amelia St., \$1,415; Ardagh St., \$9,195.

Toronto, Ont.—The Board of Control awarded the contract for construction of a sewer in Strathmore Boulevard, from Woodington Ave. to Glebeholme Ave., to the Murphy Contracting Co., at \$2,460. Contracts were also awarded to Ruscica Bros. Co. for the following sewers: Wolverleigh Boulevard, Woodington Ave. to Glebeholme Ave., \$2,199.92; Glebeholme Boulevard, Woodington Ave. to Glebeholme Ave., \$2,419.56; Milverton Boulevard, Woodington Ave. to Glebeholme Ave., \$2,030.40.

York Tp., Ont.—The Township Council received notice from the city of Toronto that 25 hydrants will be placed on Morningside, Kennedy Park Road and Runnymede Road.

LIGHT, HEAT AND POWER

Halifax, N.S.—A number of power developments are under consideration in this district. Investigations have been carried on at Bear River and Sheet Harbor, where 8,000 h.p. and 25,000 h.p. respectively could be developed. At St. Margaret's Bay 10,700 h.p. is being developed at the new power plant and at Mahone on the Mush-a-Mush River 16,000 h.p. is being generated.

RAILWAYS

Hamilton, Ont.—Plans for the construction of an incline railway up the side of the mountain at the head of Ottawa St. were presented to the Board of Control by T. H. Simpson, on behalf of a syndicate. Estimated cost, \$100,000.

New Westminster, B.C.—The Dominion Department of Public Works awarded the contract for the construction of repairs to groins Nos. 1 and 3 at Annville Bar, Fraser River, to the Fraser River Pile Driving Co., New Westminster, B.C., at \$6,432 (unit price).

Ottawa, Ont.—An order-in-council has been passed authorizing the expenditure of \$735,000 on steel rails for the government railways.

St. Catharines, Ont.—Thorold and Crowland Townships passed the by-law providing for the purchase of the Niagara, St. Catharines & Toronto Railway, while Humberstone and Grantham Townships defeated it.

St. John's, Nfld.—Sir W. G. Armstrong Whitworth company have been asked by the directors of the Newfoundland Products Corporation to act as their technical advisors in the development of the Humber River water powers and other projects. There is a total possible development of 235,000 h.p. on the Humber River and neighborhood. Surveys have been made by the Reid Co. engineers, and the plans have already been submitted to the engineers representing the Armstrong Whitworth Co., whom, it is understood, have made an estimated of the cost of development. Messrs. Armstrong, Whitworth will contract to supply all machinery and equipment for the power development and for a proposed pulp and paper mill, and will also carry out the construction work. The estimated cost of the whole development is about £4,000,000.

Toronto, Ont.—A resolution urging the Government to take action to hasten the electrification of the Midland branch of the Grand Trunk Railway and the Sudbury branch of the Canadian National System, will be introduced at a meeting of York County Council.

Toronto, Ont.—A new plan for radial entrances to the

city, alternative to that drawn up by the Hydro-Electric Power Commission, was explained to the North Toronto Ratepayers' Association at a recent meeting, by W. P. Chapman, and was endorsed by the association in principle. The plan provides for a central terminal between Edward and Dundas streets, and an open tunnel up the Teraulay street extension to another terminal at Belmont St. (Ramsden Park), then northwesterly along the C.P.R. to connect with the Guelph, Weston and Woodbridge lines. The Hamilton line would enter over the harbor development land to the new Union station and the Metropolitan by way of Bathurst street.

Windsor, Ont.—Plans for the Canadian Pacific Railway Company's proposed new freight sheds to be erected on Caron Ave. have been approved by engineers of the company. The work, which will involve an expenditure of at least \$250,000, will be started within two weeks.

Winnipeg, Man.—D. C. Coleman, vice-president of the C.P.R. in charge of western lines, announced that projected work of the company in Manitoba provides for a mechanical coaling plant at La Riviere, automatic signals at Sidney, and the improvement of water supply plants at Rathwell, McGregor and Wheatlands. Mechanical coaling plants will also be erected at Eagle River, Ont.; Estevan, Sask.; Swift Current, Sask.; and Medicine Hat, Alta. An additional ice-storage building will be erected at Okanagan Landing, B.C. and the water supplies will be improved at the following plants: Bredenbury, Hirsch, Frys, Weyburn, Macoun, Elbow, Parkbeg, Fauna, Outlook and Gull Lake, in Saskatchewan; Bow Island and Lundbreck, in Alberta; and Elko and Creston, in British Columbia. The new office building at Moose Jaw, and the extension to the Island coal dock at Fort William, will be pressed to conclusion, and a considerable amount of work will be carried on in the replacement and standardization of bridges on the line.

FACTORIES AND LARGE BUILDINGS

Athens, Ont.—The High School, recently destroyed by fire, will be rebuilt.

Brockville, Ont.—The Ontario Railway and Municipal Board has sanctioned the annexation by the town of Brockville of 125 acres in the township of Elizabethtown, where the plant of the Eugene F. Phillips Electrical Works, Ltd., will be erected.

Chingacousy Tp., Ont.—The Township Council plans the erection of an addition to the Township Hall. Clerk, Robert Kee, Cheltenham.

Courtenay, B.C.—R. Fraser Biscoe plans the erection of a theatre building.

Edmonton, Alta.—Plans for the alteration of the 101st Street market building into a technical school have been approved by the buildings and grounds committee of the Public School Board.

Guelph, Ont.—Plans and specifications for the new Collegiate and Vocational Institute will be completed by February 15, when tenders will be called for. Architect, Gordon Hutton, Hamilton.

Kingston, Ont.—The Board of Governors of the General Hospital awarded the contract for the construction of a new wing to the Dixie Construction Co.

Kitchener, Ont.—The Greb Shoe Co., Mansion St., plan the erection of an addition to their building this spring.

Lakeview, Ont.—The erection of a new school is projected.

Lambton Park, Ont.—The ratepayers of S. S. No. 33 authorized the trustees to issue debentures not exceeding \$55,000 for an addition to the school and playgrounds. Tenders will be called shortly. Chairman of School Board, A. Shaw.

Montreal, Que.—The premises of the Independent Last Co., 89 Marie Anne St., were damaged by fire to the extent of \$23,000.

Montreal, Que.—Contract for the supply and installation of all wrought iron work in Mount Royal Hospital has

been awarded to The Western Supply & Manufacturing Co., Pacific & Yeoman St., Winnipeg.

Mount Forest, Ont.—The members of St. Paul Church plan the erection of a parish hall.

North Toronto, Ont.—Plans for the erection of a new church building on the site of the present one were adopted at a recent meeting of the congregation of St. Clement's Anglican Church. Rector, Canon A. J. Fidler.

Ontario, Province of.—Instead of rebuilding the Kingston Dairy School recently destroyed by fire, the Provincial Department of Agriculture may build a modern structure at Kemptville in connection with the Agricultural College there, and disburse with the Kingston site.

Port Colborne, Ont.—Fire damaged the Maple Leaf Milling Company's building and machinery to the extent of \$15,000. The Maple Leaf Hotel was also badly damaged by fire.

Port Stanley, Ont.—The London & Port Stanley Railway Commission plans the erection of an amusement hall in the park here this spring. Tenders will be called at once.

Regina, Sask.—The Saskatchewan Motor Co., Ltd., plans the erection of a new plant.

Riverside, Ont.—The Town Council plans the erection of a new Municipal Hall and police quarters.

Riverside, Ont.—A by-law was passed providing for the raising of \$50,000 for the construction of houses. Clerk, C. J. McHugh.

Sandwich, Ont.—Recommendations that an industrial school for girls be built in Essex County, in addition to a new jail and isolation hospital, were contained in the presentment of the grand jury to County Judge J. J. Coughlin, at Sandwich.

Sarnia, Ont.—A new factory will be erected by Mackey's Bread Ltd. at a cost of \$30,000. Head Office, Toronto.

Scarboro Junction, Ont.—The ratepayers decided to issue debentures amounting to \$60,000 for the purchase of a school site.

Stouffville, Ont.—A movement is on foot by the Board of Trade for the erection of a library building. President, F. C. Hessel.

Toronto, Ont.—The members of St. Stephen's Anglican Church plan the erection of a memorial hall. Rector, Rev. T. G. Wallace.

Toronto, Ont.—Plans will be prepared at once by City Architect Price for the proposed Reception Hospital to be erected on Surrey Place.

Toronto, Ont.—Work on the construction of the new tabernacle of the Christian and Missionary Alliance, on Christie St., will be started at once.

Toronto, Ont.—A permit has been issued to the G. W. V. A. to erect a two-storey brick clubhouse on the north-west corner of College and Crawford Streets, at a cost of \$50,000.

Toronto, Ont.—The permit for the construction of the 11-storey building at the northeast corner of Bay and Temperance Streets for the General Accident Assurance Co. of Canada has been granted to the Sutherland Construction Co., Toronto.

Toronto, Ont.—The Board of Control recommended that the carpenter work on the new Northern Stables be carried out under the supervision of City Architect Price by day labor, the contractor to whom the contract was awarded having failed to carry same out.

Toronto, Ont.—Excavation has started for the erection of the new Church of the Resurrection, Milverton Boulevard and Woodbine Ave. The intention is to erect the main portion of the building at present, which will be added to as required. Approximate cost, \$32,000. Rector, Rev. E. Gillman.

Toronto, Ont.—Plans for the new church which will be built at Rushton Road and St. Clair Ave. are being prepared by the uliding committee of St. Clair Avenue Methodist Church. The new uliding will cost \$100,000, and the finance committee will launch a campaign shortly to raise the first instalment of \$45,000. Charles Summerfield is chairman of the building committee.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

The Structural Design of Pavements

Sub-Base Consideration and Economic Depth of Foundation
—Pressure Distribution and Impact Effects Shown by
Tests — Drainage of Sub-Grade an Important Factor

BY A. T. GOLDBECK

Chief, Division of Tests, U. S. Bureau of Public Roads

FUNDAMENTALLY, a pavement is a structure acted upon by a bewildering array of forces. Its structural design is a complicated problem in mechanics, and ultimately we shall have to make use of the principles of mechanics if we ever hope to arrive at what seems to be a rational method of design. Let us consider briefly some of the forces to which a pavement is subjected.

In the first place, pavements may be roughly divided into two main types, those of the rigid and those of the non-rigid type. On both types the same external forces act, but the manner of their resistance and their effects are different, depending upon the characteristics of the pavement. The pavement structure, either of the rigid or non-rigid type, is a slab supported on the subgrade. The manner of its support is widely varying for this depends upon the nature of the soil and the amount of moisture present. Our investigations of subgrade materials throughout the country show us very conclusively that soils vary widely in their supporting properties, particularly at times when they contain large amounts of water, and this very difference in the supporting properties of different subgrade materials makes the question of foundation a most important one.

Effect of Water on Subgrade

Very plastic soils become exceedingly soft when they are saturated and the more porous, coarse-grained types, bordering on the sand or sand-gravel mixtures, are practically unaffected by moisture. There is a wide range of soil types and a wide range of supporting values between these extreme limits. Special problems are encountered in different sections of the country due to the unusual behavior of the subgrade under the action of water. Thus certain soils have the property of enormous expansion upon the absorption of water and corresponding shrinkage when they dry out. Such a condition, of course, results in non-uniform support for the pavements and is to be encountered especially in the outlying rather than in the built-up sections of the city, because the outlying sections offer more opportunity for these wide ranges of moisture conditions to exist.

While discussing the question of the subgrade, the formation of ice in the saturated subgrade cannot be neglected. We are all familiar with the heaving of pavements due to this action. The presence of cracks is thus not only possible but a very frequent occurrence before traffic is turned on the pavement, and in many cases the process of destruction begins through the action of forces produced through the movement of the subgrade alone. As stated, however, most of these problems concerning the subgrade have to do with outlying districts rather than with the pavements in the center of a well built-up city.

Suppose the pavement slab is to be laid on the average subgrade in which no provision has been made for drainage. Such a slab is subjected to the action of natural

forces. We are all familiar with the expanding action due to rise in temperature and due to increase in moisture content with the tendency toward the production of pavement buckling. There are, of course, well developed and efficient methods to take care of these expansive forces. The matter of shrinkage of the pavement due to the fall of temperature and of drying out cannot be forgotten, for this is productive of cracking in concrete bases and concrete pavements before traffic is turned on the pavement. It is very natural that cracks should form under conditions of shrinkage when we consider the tremendous force of friction developed between the subgrade and the concrete and

FIG. 1—PRESSURE DISTRIBUTION THROUGH DAMP SAND FILLS.

when we consider also the low tensile resistance of concrete occurring in the early stages of hardening. The cracking of concrete base is of some importance in connection with asphaltic pavements, since often times the base cracks ex-

information which should lead to methods for the elimination of waves in asphalt pavements.

Pavement Structurally Considered

Let us consider what sort of structure a pavement is and what kind of forces it must resist. In the first place, the pavement is a slab which may or may not have the ability to resist bending. It is laid on a more or less yielding material which at various seasons of the year has different conditions of moisture and which varies greatly in its characteristics throughout the country. The loads on top of the slab are sometimes at rest but generally in rapid motion. The surface of the slab is rarely extremely smooth, and in consequence the loads moving over this comparatively rough surface are applied not as static loads but with considerable impact. Suppose the pavement slab is of the yielding type, incapable of resisting bending, such as the macadam, bituminous macadam or concrete streets common in the suburbs and outlying districts of the city. When heavy loads are placed on the surface of such a pavement, the concentrated pressures at the surface are transmitted down through the pavement to the underlying subgrade. The thicker the pavement the greater will be the area distribution of the pressures and the smaller will be the pressure per square inch under load. It is a very common error to assume that the pressure intensity is uniform and is distributed over a certain area of support, which area is defined by lines sloping 45 degrees from the point of application of the load. Such an assumption is far from the truth for the pressure intensity is highest directly under the load and spreads out to nothing at some distance from the load. The curves in Fig. 1 illustrate this point very nicely. They show the pressure distribution at different depths of a sand fill when a concentrated load was placed on the top of it.

Although we have taken pressure measurements with broken stone bases, we are not ready to publish the results, but the curves will be somewhat similar to those shown. Suppose the highest intensity of pressure produced on the subgrade directly under the pavement exceeds the bearing value of the subgrade material, and let it be assumed that the pavement slab has no resistance to bending. It is very natural that under such conditions there will be local deformation of the slab under the load due to the yielding of the subgrade. If, on the other hand, the supporting value of the subgrade exceeds the highest intensity of pressure produced by the heavy concentrated load, there will not be excessive yielding and the pavement will not be deformed.

Pressure Reaction

Let us consider the mechanics of the pavement slab which is perhaps of more common occurrence in city paving, namely, the slab of the rigid type in which there is a concrete base supporting a wearing surface of asphalt, granite block or vitrified brick. Some few years ago we first made an effort to find out something of the pressure reaction under a concrete road when supporting a heavy concentrated load. We buried a number of so-called soil pressure cells under a concrete slab directly in contact with the subgrade and a heavy motor truck was used to apply the load on the slab and the distributions of the subgrade pressures under the slab were obtained, with this heavy concentrated wheel load on the surface. The curves shown in Fig. 2 are typical of the distribution of pressure to be expected under a concrete slab. It will be understood that if we are to arrive at a rational design theory we must know something of the upward subgrade reactions just as we must know their magnitude in the design of any other structure. A number of pressure readings were taken under the slab over a period of several months, both with and without traffic, and the surprising feature of these measurements was the fact that they showed such great variations from time to time, indicating very strongly that at times the slab was being supported in certain spots and at times in others. The indications have since been borne out by other measurements, so that we know that a rigid slab

FIGURE 2.—PRESSURES UNDER CONCRETE SLAB

tend through the wearing surface. We all recognize, of course, that these natural forces of expansion, contraction and heaving, due to frost action in the subgrade, are always likely to occur but the main problem with which we are concerned in connection with the design of pavements is the adequacy of the pavement for supporting the traffic to which it is subjected. We do not have to think back over a long period of time to the time when there were no extremely heavy motor trucks and when the speed of heavily loaded vehicles was comparatively a walking pace. Pavements today, however, as a matter of every day occurrence, have to carry extremely heavy loads and this is the most important factor in the problem of proper pavement design.

Reliance on Research

There are still many problems to be solved in connection with the economic design of pavements and many problems in connection with the structural design to withstand traffic. We are continually attempting to get more and more light on these various problems by research methods. One investigation which we are conducting with the Asphalt Association involves the question of the causes of shoving of sheet asphalt pavements. We are doing this with the hope of being able to find a means for the elimination of this undesirable feature of sheet asphalt. We are also studying questions of the proper characteristics of bituminous materials, the proper mixtures of bituminous concrete, and the construction of bituminous macadam. These tests will be conducted on a large scale through the use of a circular track over which ordinary traffic will be run. Through careful observations of the test sections under traffic and the co-ordination of these sections with the laboratory tests of materials used, we hope to get some

certainly does not receive uniform subgrade support, and at times it bridges over areas offering no support whatever.

Slab Stresses

A little thought will show us that we may assume a number of conditions of subgrade support which are very common as applied to pavements. For instance, these conditions may be listed in the following cases:

Case 1. That in which the slab is uniformly supported on the subgrade and is acted upon by the concentrated loads of traffic producing a typical curve of pressure distribution as already described.

Case 2. A slab spanning a hollow spot in the subgrade receiving a rim of support, a heavy load acting upon the center of the slab over a hollow spot.

Case 3. A slab heaved by frost action at the sides with little support at the center, two heavy trucks passing one another.

Case 4. A slab supported at the center, two trucks passing one another, tending to break the slab by tension at the top.

Case 5. A heavy load at one corner of the slab tending to break off that corner.

The accompanying plate No. 3 gives approximate formulas for the maximum tensile stress that might be expected in a concrete slab when subjected to these different conditions. No attempt will be made to go into the theory from which these formulas were derived, as this has been treated elsewhere. ("Thickness of Concrete Slabs, by A. T. Goldbeck, Public Roads, April, 1919.")

The analyses of these formulas will show that under the conditions assumed with two trucks passing one another the slab will have to be exceedingly thick to carry the loads without longitudinal cracking. If it were necessary for our roads to withstand static loads alone, our design problems would be comparatively simple, but unfortunately the forces exerted on the road surfaces are considerably higher than mere static loads.

Impact Effects

Our tests on the measurement of impact on roads have already been described before the Philadelphia Engineers' Club and have been printed in their journal. I wish, however, to call attention again briefly to some of the results. We measure the impact by an approximate scheme, making use of the deformation under impact of a copper cylinder in comparison with a like deformation of a similar copper cylinder under a static load in order to express the magnitude of the impact. It will be recalled that we used a number of different weights of motor trucks running at different speeds, equipped with different kinds of tires and caused the trucks to produce impacts under different conditions, varying the height of fall from zero up to 4 in. Speaking approximately, these impact tests on a pavement of ordinary roughness showed that the maximum pressure produced under impact might be four or five times the wheel pressure when the truck is at rest. The amount of the impact was dependent very largely on the kind of tires, and to some extent on the design of the vehicle. Apparently, the amount of cushioning supplied by the tire governs the amount of impact; the better the cushioning properties, the more nearly the impact approaches a static load. With impact effects under moving wheels equaling four or five times the static load of the vehicle, it is very apparent that such impacts are apt to have a very serious effect on the pavement surface, as well as on the entire pavement structure.

We have just completed a large series of tests on pavement slabs of different types subjected to impact and to my mind these tests apply directly to the conditions of city paving. The amount of impact having been determined, the question naturally arises in our minds as to what effect this amount of impact would have on different types of pavements. In order to determine this we laid down a number of slabs of concrete of different design and also a number of brick slabs on concrete as well as broken stone bases. We attempted to have half of these slabs on a very wet subgrade and half on a very dry subgrade in order to show us the effect of different subgrade support. Then we

rigged up an impact machine that consisted of a heavy weight of 1,800 lb., shod with a piece of 12-in. truck tire. Upon this weight we mounted a 5-ton truck spring and the spring supported a box in which was placed a weight of

Notation

- S = unit tensile stress
- P = concentrated load
- d = thickness of slab in inches
- w = weight of concrete per square inch with thickness d
- S = width of slab in feet

Case I—Slab Supported by Subgrade—Cone of Support

$$S = \left[\frac{3P}{2\pi d^2} - \frac{2wR^2}{d^2} \right] \frac{6}{10}$$

Case II—Slab Spanning a Circular Soft Spot in Subgrade

$$S = \left[\frac{3P}{\pi d^2} - \frac{2wR^2}{d^2} \right] \frac{6}{10}$$

Case III—Slab Supported at Sides of Road—Two Trucks Passing

$$S = 0.6 \frac{P}{d^2} \left(\frac{2-3}{1.5-3} \right) + 9.4 \frac{S^2}{d^2}$$

Case IV—Slab Supported at Center—Two Trucks Passing

$$S = 0.6 \frac{P}{d^2} \left(\frac{2-6}{3} \right) + 9.4 \frac{S^2}{d^2}$$

Case V—Load at Corner of Slab

$$S = \frac{3P}{d^2}$$

FIGURE 3—FORMULA FOR STRESS IN ROAD SLABS UNDER LOAD

6,000 lb. This entire weight was then raised and allowed to fall repeatedly, beginning first at a very small height of fall and after every 500 blows this height of fall was increased slightly.

Pavement Thicknesses

Generally, it might be stated as the result of these tests that the resistance shown by 1:1½:3 concrete, 7 ft. square slabs is very consistent and increases uniformly with the increase in thickness. In the slab 6 in. or more in thickness only primary cracks formed, while the 4-in. slabs were punched out at the center. From this it would seem that plain concrete surfaces 4 in. in thickness are entirely inadequate for heavy motor truck traffic. Monolithic brick slabs in most cases showed less resistance than 1:1½:3 concrete slabs of the same depth. Failure seemed to result from shearing of the brick top from the concrete base before full resistance of the monolith was developed. The indications are that under impact, shearing stresses are much more severe than under static loads. Grouted brick surfaces compared favorably with 1:1½:3 slabs of the same thickness, while grouted brick beams showed resistance in excess of those offered by 1:1½:3 concrete in static loads. The slab strength of the concrete base was very little increased by bituminous filled brick surfaces.

The indications are that the resistance of the specimens increased with increased bearing value of the subgrade. The relation between the strength of 1:1½:3 and 1:3:6 concrete specimens, as shown both by static beam tests and impact slab tests, differs from that shown by the compressive tests on cylinders and cubes. Although the compressive strength of 1:3:6 concrete was 50% of that of the 1:1½:3 concrete, the difference between the beam and slab strength of these two mixes does not exceed 20%. As a result of the analyses of these experiments, the curve shown in Fig. 4 was prepared indicating the relation between the thickness of a 1:1½:3 concrete slab in inches and the resistance which such a slab 7 ft. square offers to

impact when laid on a subgrade such as existed during the tests. Although such a curve does not lead us with certainty to the rational design of concrete bases of pavements, it goes far in aiding our judgment as to what the proper

FIG. 4—RESISTANCE OF 1 1/2 : 3 CONCRETE SLABS TO IMPACT

thickness of the pavement should be to withstand certain kinds of traffic. Our impact tests have already shown us what impacts to expect. The present curve shows us what slabs are capable of resisting various amounts of impact. Combining this information with what we know of subgrade conditions, we are in a much better position to say when our pavement thicknesses are adequate.

Practical Considerations

In considering the design of such pavements, particularly pavements in well built-up portions of the city, I believe that in general we can safely assume that the subgrade will almost never become as wet and soft as it has a chance to become in country highways where the surrounding country can become thoroughly water-soaked. I need not call your attention to the fact that such pavements are thoroughly protected from moisture from above. Moreover, any water which through underground sources might have a tendency to accumulate, is conducted away by the numerous sewer pipes under the pavement. Then too, in congested portions of the city, the motor truck traffic necessarily moves quite slowly, so that the impact is much reduced below what it might be on open stretches of concrete. So that, no doubt, many pavements which have proven inadequate for country highways when subjected to heavy motor truck traffic, would give splendid service in congested portions of cities. It is true that no matter where an opening is made in a city pavement it will be found that the subgrade is moist, but recent experiments made by us seem to show that when soils have moisture in them which does not exceed the so-called "moisture equivalent" their bearing value is quite high and when the moisture exceeds the "moisture equivalent" the bearing value is greatly reduced, although this has not been established as a rule of universal application to all soils. I am of the opinion that the subgrade material under our city pavements practically never has a percentage of moisture exceeding the so-called "moisture equivalent." (Tests for Soils with Relation to their Use in the Subgrade of Highways," by Messrs. Jackson and A. T. Goldbeck, A.S.T.M. Proceedings for 1921).

In the more open sections of the outlying districts of the city there is more danger of the subgrade becoming soft and it is here that we might expect trouble from the combinations of heavy loads and soft subgrades, for the corres-

ponding conditions of traffic, I would feel inclined to design heavier sections for the outlying districts than for the well built-up sections of the city. In residential sections, failures in pavements are often noted, notwithstanding the comparatively light traffic. This is particularly so in conditions where there are high terraces on one or both sides of the street and it is very probable that such a condition of topography is productive of high moisture content in the subgrade under the street. Under such conditions it will be well to keep in mind that here failure is likely to occur and here the design should be made heavier for the conditions of traffic to be met than elsewhere where the topographic conditions are more favorable toward natural drainage, or special drainage precautions should be used. For the conditions at Arlington we were unable to produce failure in any of our 10-ft. slabs, but we did succeed in breaking the remaining slabs.

I hesitate to attempt, on the basis of my present knowledge, to formulate any definite rules of procedure in selecting the proper thickness of pavement for various conditions. I think that from what I have said thus far, and especially from a detailed study of the several papers which have been written in connection with our studies at the Bureau of Public Roads, you will not be lead far astray in letting these results aid your judgment, especially if you are careful to keep in mind the probable condition of subgrade support and the probable traffic and its speed.—From a paper read recently before the Conference on City Paving, at Philadelphia.

ELECTRICAL OPERATION OF SUCTION DREDGER

A 20-in. suction dredger in use on the Sumas River in Washington was recently converted from steam to electric operation by the Marsh Construction Company. As now arranged the dredger has a total connected load of 1,322.5 h.p., with motors ranging up to 1,000 h.p. Current is used at both 2,300 and 440 volts, a cable and reel maintaining connection with the shore as the vessel moves forward.

Power is taken from the 34,000-volts transmission line that parallels the line of operation of the dredger, leads running from it to a bank of three 500-k.v.a. transformers mounted on a scow moored to the bank of the river. This scow and the dredger are connected by a 1,000 ft. length of submarine cable carried by a reel mounted on a small scow lashed to the dredger. This cable is paid out automatically as the dredger moves ahead until all the cable has been reeled out. The transformer scow is then cast adrift and moved ahead, the slack in the submarine cable is coiled up on the reel, and a new connection is made between the transmission line and the transformer bank in its new position.

The two largest power units on the dredger are the 1,000 h.p. motor that drives the main pump at the rate of 300 r.p.m., and the 150 h.p. motor that operates the cutter through a set of reduction gears. After the dredger had been in operation for a few weeks material was being handled at the rate of approximately 600 cu. yd. an hour at a cost for power of from 1 to 1 1/4 cent per yard. Under normal operating conditions the dredger requires from 900 to 1,000 kw.

A conference of Elgin County road foremen will be held in the Court House, St. Thomas, about March 1. Frank Pineo, County road superintendent will be in the chair. A similar conference will be held in London on February 23 under the direction of Engineer Talbot, superintendent of the Middlesex county roads.

The headquarters of the Alberta Architectural Association will be removed from Edmonton to Calgary for a period of two years, and the next annual meeting of the association will be held in Calgary next year. At a meeting held in Edmonton on Feb. 1, Jack Burrell was selected president and R. A. Millar, secretary-treasurer.

THE ORGANIZATION OF METROPOLITAN DISTRICTS

Report of Sub-Committee on Sewage Submitted to American Society of Municipal Improvements—Powers of Boards Controlling Districts

By Langdon Pearse

Sanitary Engineer, Sanitary District of Chicago

WITH increased attention to water supply and, in particular, the development of pure water supply and clean waterways, considerable activity has resulted in the formation of various commissions, boards of districts, looking toward the provision of facilities for two or more municipalities acting together. These efforts have come about through the legal difficulty of co-operating without some method of joining responsibilities by organization, and with the knowledge that better development can be had through utilities, such as a water or sewer system, planned to serve a drainage area or district rather than individual towns by political boundaries. This tendency was early recognized in England through the formation of river boards, such as Birmingham, Tame and Rea Drainage Board, under whose control is the removal and disposal of sewage of Birmingham and surrounding territory. Such boards in England have been jointly organized under various parliamentary acts for the cleaning of streams to prevent nuisance. In the United States the tendency was originally toward the formation of commissions organized and empowered by the state to carry out specific work. Among the earlier commissions were the Metropolitan Sewerage Board in Massachusetts, serving Boston and the metropolitan area around, and the Metropolitan Water Board. These two were later consolidated into one board after the major portion of the work had been accomplished. The Water and Sewerage Board has developed largely into an operating organization. On the other hand, in the West, in Illinois, the formation of sanitary districts received an early start with the enabling act in 1889 forming the Sanitary District of Chicago, a separate municipal corporation with broader powers than those of the Massachusetts Commission; the former being a separate municipality overlying other municipalities, but with a particular purpose and indefinite life. Further, broader bonding and taxing powers were given than in the East. Other enabling acts have been passed in Illinois and in Indiana. In New Jersey, the formation of the Passaic Valley Sewerage Commission and such joint projects, as the Plainfield, North Plainfield and Dunellen Sewerage District, have added to the list.

In the desire to obtain municipal ownership of waterworks in the State of Maine, the water district idea was developed largely through the efforts of Harvey B. Eaton, an attorney, who has summarized the history and enabling acts very completely in a paper entitled "Maine Water Districts and Appraisals" published by the New England Works Association.

The Maine water districts resembled the Sanitary District of Chicago, in that they had bonding and taxing powers and were overlying municipalities organized for a specific purpose, in the water districts, that of serving water. A number of districts have been organized in Maine. Elsewhere might be mentioned the Greater Winnipeg Water District and the Metropolitan Water Board of London (England). There are also a number of private water companies supplying groups of towns.

In a report upon the metropolitan water and sewerage systems made to the Essex Border Utilities Commission, Windsor, Ont., (1917). Morris Knowles has covered very broadly the Metropolitan district idea, pointing out the need of community co-operation, the methods of securing unity action by (1) annexation, (2) extension of municipal jurisdiction, (3) contracts between municipalities, (4) county administration, (5) private enterprise, (6) metropolitan districts. Various examples are discussed, and the difficulties. The methods in vogue of payment of costs are also discussed, chronologically.

Our Committee has tried to summarize in convenient form most of the existing organizations. It is hoped that discussion may be promoted, and possibly further examples cited to make the report more complete.

No mention will be made in this report of the commissions organized to make engineering reports or metropolitan projects, such as the Metropolitan Sewerage Commission (N.Y. City), Commission on Additional Water Supply (N.Y. Hering-Burr-Freeman), Charles River Dam Commission (Boston) and others. Their field has been a useful one, in most cases paving the way for construction and leading to broader acts for the construction organization.

Schemes Tried for Organizing Metropolitan Areas

In general, it is the purpose of this report to cover largely the districts formed for sewerage or drainage of metropolitan areas, and not the drainage of farm areas. For the purposes of constructing the sewerage system of large metropolitan areas, and the disposal of sewage therefrom with the increase of population, and the need of more complete methods, various schemes have been tried as outlined. These may be summarized according to the degree of authority given, and appear to fall under four general groups.

1. Commissions or boards formed by city councils for the specific purpose of building intercepting sewers largely and practically within the confines of one municipality. These hardly come within the definition of the metropolitan districts serving two or more municipalities, but should be mentioned because of the organization of such commissions as the Fitchburg Sewer Commission, and the Syracuse Intercepting Sewerage Board, and others.

2. Boards or commissions appointed by elective officers of cities, county or state, given resources, either limited by specific act or by action of the municipal or Federal bodies governing the municipalities composing the district. Under this classification might be placed such boards as the Metropolitan Water and Sewerage Board, the Passaic Valley Sewerage Commission, the Commission of the District of Columbia and others.

3. The formation of sanitary districts which are complete municipalities in themselves, with powers of taxation, with bond issues dependent upon referendum, and with officials appointed by county or state officers. Under this classification come the smaller sanitary districts in Illinois, such as those organized at Decatur, Bloomington, the North Shore Sanitary District, and Downers Grove.

4. Sanitary districts organized as municipalities with complete taxing and bonding powers, without referendum on bonds, with governing officials elected by direct vote of the people residing within the limits of the district. Under this classification comes the Sanitary District of Chicago.

Practically all the districts mentioned and discussed in this report are those lying within the boundaries of one state. The Committee has thought it desirable to call to the attention of those interested the need of some form of organization which will insure co-operation between districts lying in two or more states. With the growth of pollution in streams, and the difficulties in obtaining suitable water supplies such metropolitan difficulties may occur on stream watersheds, both from the water and sewerage standpoint, involving two or more states, as in the case of the Ohio River, for instance, involving Ohio, Kentucky, West Virginia, Pennsylvania and in Missouri territory in the vicinity of Kansas City where territory lying in Missouri has to be considered. Such relations under the governmental organization of the United States would appear to require a federal Act covering the creation of river or drainage boards, with powers extending over several states, to co-ordinate effort and use common policies in matters relating to use of streams for sewage disposal and the taking of water supply therefrom. This would appear to be the next development in a chain of acts which has been gradually formed through the last forty years.

To finance the necessary works, money must be raised. This is usually done by issuing bonds, or by special assess-

ment. Occasionally part of the general taxes is also designated. Operating and maintenance charges, as well as the payments of interest and sinking fund to retire bonds, when issued, are generally met by taxation, or by special assessments and also by rates based upon service.

Where the power to issue bonds is given the amount to be issued is usually fixed, sometimes by definite figures as at Fitchburg and Syracuse, but generally in terms of percent of the valuation of assessed property. In many states this is 5 per cent, an amount fixed by the state constitution. In the Indiana acts, the per cent is fixed at 0.5 of 1 per cent for Indianapolis, and 2 per cent in the general act (1913). In Illinois, the Sanitary District of Chicago has a 3 per cent limit, whereas under the other Illinois acts, a 5 per cent limit is set. The maximum rate of interest is also sometimes stated. The maximum rate of interest on bonds is often limited to 5 per cent as in Indiana, although in the case of Indianapolis a 4½ percent limit was fixed. The retirement of bonds is also provided for, 20 year annual installments being common, notably in Illinois and Indiana. In the Essex Border Utilities Act the limit was set at 30 years, whereas at Indianapolis 50 years was allowed.

In the older districts bonds may be issued without referendum for corporate purposes. In the districts formed more recently, many acts require a referendum on the bonds, as a whole. Where the act specifically limits the amount in dollars, as a rule the act is the result of public agitation demanding particular relief.

In the case of the Illinois and Indiana districts, special assessment has not been used to meet construction costs in Metropolitan organizations. In the Passaic Valley, however, the cost of construction was assessed or apportioned among the various constituent municipalities roughly in proportion to the service rendered. In the Vancouver sewage act 30% of the construction cost is to be assessed upon the municipalities in proportion to their land valuations, and the remaining 70 per cent in proportion to the valuation upon lands benefited. But in determining the division of operating costs, assessment is frequently made against the individual municipalities in the district, which in turn is distributed by taxes or service charges as in the Boston Metropolitan District, Passaic Valley and Miami Conservancy. In Illinois and Indiana, tax levies are made through the usual machinery, to raise the moneys to pay interest, operating and maintenance expense, and provide a sinking fund to retire bonds.

The maximum rate of taxation is usually fixed. There would, however, seem to be a legitimate need for a minimum rate to provide necessary funds for running expenses.

In Indiana, for Indianapolis, a levy of two cents on the \$100.00 was allowed, plus a levy for sinking fund and interest. The general Indiana Act provides for 0.25 of 1 per cent.

In Illinois, the Sanitary District has a taxing power of 2/3 of 1 per cent of the assessed valuation. Owing to the scaling of the amount by the county clerk, a recent amendment has placed a minimum rate of ½ mills on the dollar. The general Illinois acts provide in one case for a rate not to exceed 1/3 of 1 per cent, and in the other for half of 1 per cent, although this latter may be doubled by a referendum vote.

In the Miami Conservancy District a levy of 0.3 mills on the dollar is provided for preliminary expenses.

The size of the governing board varies widely from a minimum of three (Illinois general, 1917) to a maximum of 13 (New Orleans) in the U. S. and 17 (Essex Border) in Canada. Some acts provide for service without pay, others provide pay as high as \$7,500 per year.

The limits set on the powers of the board vary. Some acts are very explicit on the terms of advertising contracts, etc., others are not. Ten days is a common limit, but some prescribe thirty-one days. The limit of expenditure without advertising is occasionally fixed, \$500.00 being a common figure.

In general, the acts appear to have been effective in providing machinery for necessary work. Occasionally, where a referendum is required, the project has failed by

lack of votes to authorize bonds (Bloomington and Normal) or has been delayed by failure to seek authorization of bonds. The limits set by per cents of valuation in some cases have proved inadequate, and in future acts should be chosen with greater care, to provide necessary funds, both by taxation and by bond issue.

Greater Vancouver Sewerage District

The greater Vancouver Sewerage District was organized in 1913 for the construction and maintenance of the necessary intercepting sewer and sewage disposal plants for taking care of the Urban district around the city of Vancouver.

New Orleans Water and Sewerage Board

The New Orleans Water and Sewerage Board was organized under an Act of the Legislature in 1889. The Act was made operative by vote of the registered tax payers of the city of New Orleans. The Board is composed of thirteen members, including ex-officio the Mayor, commissioners of public finance, public utilities, public property, president and members of the Board of Liquidation, and seven members representing the seven municipal districts, the latter appointed by the mayor. These members hold office twelve years each without pay. There are standing committees known as the executive, finance, sewerage and water, and drainage. The organization is operated under a general superintendent, who is also a chief engineer, with six departments.

Syracuse Intercepting Sewer Board

The Syracuse Intercepting Sewer Board is organized under an Act providing for the appointment of three intercepting sewer commissioners by the mayor and hold office for five years. The Enabling Act authorizes and empowers the Board to construct certain intercepting and storm water sewers, and also regulate and improve particular water courses throughout the city. From time to time the Act has been amended to provide for sewage disposal works, additional storm water sewers and flood prevention. As amended, the Act provides that bonds may be issued up to the amount of \$3,200,000 to be sold by the city upon resolution passed by the Board requesting funds in definite amount.

Fitchburg Sewage Disposal Commission

Under Chapter 461 of the Acts of 1910, State of Massachusetts, the Fitchburg Sewage Disposal Commission was organized by the appointment of three commissioners by the mayor with power to construct a system of sewage disposal. Under Chapter 354 of the Acts of 1901 the amount of bonds issuable was limited to \$500,000, but this limit was extended by a subsequent Act providing for an additional \$500,000. Under this Commission the chief engineer was also the city engineer.

Metropolitan District Commission

Under Chapter 350 of the General Acts of 1919, Massachusetts, provision was made for the formation of the Metropolitan District Commission, whereby the Metropolitan Park Commission and the Metropolitan Water and Sewerage Board were consolidated. The Metropolitan District Commission is to consist of one commissioner and four associate commissioners appointed by the Governor with the advice and consent of the State Council. The commissioner is to be appointed for a term of five years, and the associate commissioners will eventually be appointed for the term of five years, although at first for one each for 1, 2 and 4 years. The commissioner is made the executive and administrative head. The Commission may be organized into divisions as heretofore, with the usual clerical, police and engineering force.

Washington Suburban District

Provision was made by Chapter 122, Acts of 1918, Maryland, for the organization of a Sanitary Commission in the Counties of Montgomery and Prince George for the construction of sewerage works. The administration pro-

vides for three members, one to be appointed by the Governor, and one by each Board of County Commissioners. Funds are to be derived by joint taxes for trunk lines and by special assessment for laterals.

Indianapolis Sewerage District

The Act under which the Sanitary District of Indianapolis was organized is Chap. 157 of the Acts of 1917, of the State of Indiana. This Act is written for cities of the first class, and creates, in addition to existing executive departments, the Department of Public Sanitation, under the control of a Board of three sanitary commissioners; two to be appointed by the mayor and the third to be the city engineer ex-officio. One of the two appointees should be an engineer, nominated by the State Board of Health of Indiana. The engineer and the nominee of the State Board of Health nominate the third man for approval of the mayor. The commissioners serve for four years. The powers given to the commission are broad and cover and control the construction of sewage disposal works, intercepting sewers, maintenance of operation, and also the handling of garbage, from the standpoint of disposal, but not collection. The Board has the power of condemnation within five miles of the city and can enter for surveying.

Sanitary Districts in Indiana

Chap. 307 of the General Laws of Indiana, 1913, is an Act providing for the incorporation of Sanitary Districts. The original Act provided that two or more incorporated municipalities in any one county might form a Sanitary District, upon petition of 500 legal voters, and upon the majority vote passed by each municipality in an election held for the purpose. Five trustees are to be appointed by the Governor of the State. The Act provides for the construction of works, including sewers, sewage treatment plants and pumping stations, and for the issuing of bonds in an amount not to exceed 2 per cent. of the valuation, together with the levying of taxes to pay the interest and principal. The bonds shall not run more than 20 years.

The District of Columbia

The District of Columbia, which is the seat of government of the United States, as defined by the Constitution, comprises a territory of seventy square miles, ceded by the State of Maryland to the United States and located at the head of tide water on the Potomac river. The population, July 1, 1921, was 460,000.

Under powers conferred by the Constitution, the Federal Congress exercises exclusive and almost unlimited powers over the population within this territory. After a varied experiment for three quarters of a century with local self government, in 1878, Congress took away all such rights and placed the District under a commission form of government, with a board of three commissioners appointed by the President of the United States each for a term of three years with no limit as to reappointment. The Commissioners of the District of Columbia, constitute a governing board that is purely administrative. Exclusive of their functions as a Public Utility Commission, they have no broad, governing powers, and what may appear to have considerable scope, are in reality so restricted by the acts or the action of Congress as to possess only the barren powers of recommendation. In this connection it is to be noted that both the Senate and the House of Representatives maintain a standing "Committee on the District of Columbia," and in addition the Appropriations Committee of the House has a permanent sub-Committee which in effect is authoritative in all fiscal matters.

Not all the amounts thus appropriated in great detail as to items, are expended under the direction of the Commissioners of the District of Columbia, but come under the exclusive control of the Department of the Federal Government, such as War, Justice, etc.

As Congress fixes just what streets are to be paved and what school houses built and the amount allowed for each individual item, the expenditure of the appropriations may be considered purely administrative. The Commis-

sioners have no bonding powers, and no taxing powers except as noted, and no referendum is permitted the population on any subject. The Water supply is under the War Department except only the municipal distribution mains and house meters.

New Jersey

"The Joint Meeting of the Inhabitants of the City of Plainfield, the Borough of North Plainfield and the Borough of Plainfield" is the corporate title of the joint municipality which handles the sewage and treats it at Green Brook Park.

The first step was the passage of a law by the State legislature in 1910 permitting two or more municipalities to join in a contract for the collection and disposal of sewage and authorizing such joint municipalities to acquire land outside of their own boundaries for sewage disposal sites and defining procedure in claims for damages. The second step was the execution of a contract among the three municipalities providing for proportioning costs of construction and operation. The division of the cost of construction was somewhat arbitrarily determined for the reason that the above-mentioned law states that any municipality having paid not less than 25 per cent of the initial cost shall have a veto power on all matters of expenditure. North Plainfield chose to pay this proportion in order to secure such veto power. The division of costs agreed upon in per cents was Plainfield 68, North Plainfield 25, Dunellen 7. All new construction work and enlargements are paid for in this proportion, but the provision is made that enlargements made necessary by the abnormal demands of any one municipality over its proportionate share shall be paid for accordingly by such municipality.

Money for construction costs was provided by bond issues of the individual municipalities, the money being provided from time to time in accordance with the Engineers' progress estimates. Construction bills were approved by the Engineer, passed upon by the "Joint Meeting" (the entire council of each municipality in joint session), then passed upon by each council independently the money appropriated by each council separately and paid into the hands of the Treasurer, who then paid the bills by checks signed by himself, the president and the secretary of the Joint Meeting.

Passaic Valley Sewerage District

Passaic Valley Sewerage Commissioners is a corporate body existing under the laws of the State of New Jersey for dual purposes; first, to act as the agent of two or more municipalities, lying in whole or in part within the Passaic Valley Sewerage District, in the construction and operation of system of metropolitan sewerage works for the relief of the polluted condition of the Passaic River; and second, to act, as an arm of the State, to prevent the pollution of the said river after a date fixed by the Legislature.

There are five commissioners, one being appointed each year, by the Governor, to serve a term of five years. The Passaic Valley Sewerage Commissioners have no taxing power. Monies for the construction of sewerage works are made available through definite appropriations authorized, from time to time, by the contracting municipalities, each municipality paying a proportionate share based on its net taxable valuations. The cost of operation and maintenance is to be apportioned, annually, among the contracting municipalities, in direct ratio with their respective sewage flows.

Miami Conservancy District

The Miami Conservancy District is organized under the Conservancy Law of Ohio, passed February 5, 1914. This law was prepared to provide the necessary machinery for works to prevent flood, to protect cities, villages, farms and highways from inundation and to authorize the organization of drainage and conservation districts. Briefly the conservancy district is established by petition of the property owners to the Court of Common Pleas in any country. The Court appoints a board

of three directors and also three appraisers. The Miami District includes part of ten counties. The appraisers appointed by the Court have no executive functions, their duty being to determine benefits and damages. The Board of Trustees is the governing body of the municipal corporation with discretion to organize the administrative offices as they deem best. The organization of the Miami District is as follows: The Secretary of the District makes the immediate routine and administrative contact with the Board of Directors and has general supervision of the offices. Under the Secretary are the three departments. The Department of Taxation is occupied with the clerical work of spreading the assessment on the tax books. The Farm Department is engaged in disposing of the surplus lands which were secured in our right of way condemnations. Otherwise the entire work of the District is in the hands of the Department of Engineering and Construction.

The Chief Engineer is in direct charge of engineering and construction for the District. He employs men, makes contracts, which in important cases are presented to the Board, and is in every respect responsible for engineering and construction. The Department of Engineering and Construction is separated into two divisions. The Engineering Division exercises the usual functions of the engineer, while the Construction Division exercises the usual functions of the contractor. These divisions are manned as though the job were let on contract and the responsibility is distributed on that basis. However, there is very close co-operation between the Engineering and Construction Departments since both are under the direction of the Chief Engineer.

Essex Border Utilities Commission

This act as amended is No. 15 of the year 1921, in the Province of Ontario. The Essex Border Utilities Commission is an interesting development, providing the necessary machinery for the handling, not only of sewers and sewage treatment, but also water works, board of health, hospitals, parks and town planning, for a number of communities. As at present constituted the Commission consists of the mayors of five towns, two reeves and ten members elected every three years. Money is raised by special taxes and by the sale of debentures, the term of which shall not exceed 30 years. The cost of construction, maintenance and operation is divided in proportion to the benefit, as determined by the engineer. Questions are submitted to qualified voters for referendum and must be approved by at least three of the municipalities.

The Sanitary District of Chicago

Operative under the Act of May 29, 1889. The original Act of May 29, 1889, has been amended in various years, both to extend the powers of the District and to cure various defects found, as well as to provide for annexation of additional areas. While originally drawn as a General Act, it has been adopted alone by the Sanitary District of Chicago. Powers are granted by the charter to build channels, drains and docks, dispose of water power, and by the most recent amendment specific power to construct intercepting sewers, pumping stations and sewage treatment works. The District at present comprises some 45 municipalities, including the city of Chicago. For the purpose of administration, a Board of nine members is provided, three of whom are elected every two years, and one of whom is chosen by the Board to act as presiding officer. The funds for the work are provided by the issuing of bonds, in amounts not to exceed 3% of the assessed valuation. For operating expenses, payment of interest and the like, provision is made for a taxing power not to exceed 2/3 of 1% of the assessed valuation. The most recent amendment provides for a minimum levy of 1.2 mills on the dollar. The area served at present is 395.51 square miles, and includes all of Chicago and 45 incorporated cities and villages.

Illinois Sanitary Districts

The difficulty of financing sewage disposal projects for the smaller cities of Illinois, ranging from 10,000 to 50,000 in population, lead to a desire for a Sanitary District Act,

which would suit their needs. The Act creating the Sanitary District of Chicago did not prove applicable. Two acts are in existence in the laws of the State, one being printed in the Laws of Illinois, creating sanitary districts, and providing for sewage disposal; the other given in Hurd's Revised Statutes, being an Act passed in 1911. The latter Act is drawn largely with reference to villages taking water from Lake Michigan. General powers are given to the Sanitary District to construct works, and further levy an annual tax for corporate expenses not to exceed 1/3 of 1% of the valuation. Before any bonds can be issued, a referendum has to be held. Under this Act, one Sanitary District has been incorporated, the North Shore Sanitary District.

Under the Act of 1917, several sanitary districts have been incorporated, including Decatur, Bloomington, Normal and Downers Grove. Broad powers are given to the Board for the purposes of constructing sewerage works and sewage treatment.

Wisconsin

The Milwaukee Sewerage Commission operates under an Act entitled "An Act relating to the Sewage Disposal Works in Cities of the First Class." This act provides that the common council of any city of the first class may vote for the establishment of a sewerage commission, and if carried by a majority, the Mayor appoints five members. The Commission covers construction of intercepting sewers and sewage treatment works. Provision was made in 1917 for approval of plans where other towns in the same county are doing similar work. This has been enlarged in 1921 to provide for a Metropolitan Sewerage Commission, consisting of 3 members appointed by the Governor, one of whom is to be a member of the city sewerage commission.

Greater Winnipeg Water District

The Greater Winnipeg Water District was originated under Province of Manitoba Acts of 1913 and provides for the organization of a municipal corporation including at first four municipalities. The Board is made up of the Mayor and Board of Control of Winnipeg; the Mayor and one member of the council of St. Boniface, and the Mayor or Reeve, as the case may be, of the minor municipalities. The Mayor of Winnipeg is chairman of the Board. The purpose of this Water District is to supply the inhabitants with pure water from a permanent source in bulk to each of the municipalities. The cost of service is to be arrived at on the basis of maintenance operation and management.

Board of Water Supply, New York City

This well-known board was authorized by Chapter 724 of the laws of 1905, New York State. For many years it has been the custom of the City of New York when it had a large public improvement to carry out, to create a special Commission for that purpose, having broader powers than possessed by any of the City departments. So the Act was passed, with the object of securing administrative authority with broad powers and not subject to the many annoyances and delays to secure successive approval of the public bodies, as in the case of the regular city departments, and also to secure reasonable permanence of office. The Act provides that a Commission to be known as the Board of Water Supply, with three members, be appointed by the Mayor, this board to determine what sources were most available, desirable and best for an additional supply of pure and wholesome water for the City of New York, and report to the governing Board of the City, the Board of Estimate and Apportionment. This Board was to approve the outlined plan of the project for a new water supply, which could be submitted in parts or as a whole and be modified later, if desirable, with the approval of the same body. It was the duty of the Board of Water Supply to prepare contracts and carry out the work without any further approval of the governing Board of the city.

At a meeting of the Ontario Association of Architects in Hamilton on Feb. 7, Major R. Lewis gave an address on "Waterproofing."

COMPARATIVE METHODS OF LIFTING SEWAGE

Relative Advantage of Three Methods of Pumping Sewage
—Efficiency of Different Types of Pumps—Maximum Heads for Lifting Sewage

By F. G. Lloyd, F.C.S.

MY excuse for dealing with this subject is that I have had some years' experience with pumping plants, and I recently obtained very interesting information when carrying out a series of tests on centrifugal pumps.

We may, I think, confine our attention to three methods:—Centrifugal and reciprocating pumps and ejectors. It should be distinctly understood that I have not arranged the headings with any idea of suggesting they are placed in order of merit. That, of course, is entirely a matter of opinion and a question to be determined by local conditions.

It may be pointed out that with centrifugal and reciprocating pumps screening is absolutely necessary, but with ejectors it can, under most circumstances, be dispensed with.

Centrifugal Pumps

This is a rotary pump, transforming the velocity of the liquid into pressure. Manufacturers' designs will vary in detail, the number of vanes may differ, and we have the open and shrouded impellers. When dealing with clear water, the shrouded type may be quite satisfactory, but sewage is a different matter altogether, and from experience of both, I unhesitatingly express my opinion in favor of the open type. There is less liability of choking and consequent friction, and on test it gives altogether better results.

I think I am correct in stating that by far the greater number of sewage works use centrifugal pumps for the reason that they are less liable to give trouble owing to the absence of valves. When placed above the sewage they require priming, but can be fixed in chambers below water level to obviate this, and if electrically driven can be started and stopped automatically by float gear.

I would like to submit for your consideration one or two points in construction that I consider important. With regard to accessibility, the inspection or hand holes should be sufficiently large to enable any foreign matter that collects in the eye of the pump to be removed without difficulty. They should be provided with a top cover in preference to one at the side to enable the wear on the impeller and side plates to be more readily gauged. The side plates should be of chilled steel and conveniently fixed for renewal and the impeller of manganese steel. In consequence of the grit contained in sewage, the ordinary cast-iron impeller very soon shows signs of wear.

I express the opinion that the speed should be kept as low as possible, and by so doing we have a larger pump and consequently greater clearance, and owing to the reduced velocity of the sewage the life of the pump is considerably longer. I am unable to say definitely, but I consider that by doubling the speed the wear is probably increased by four times. Apropos of this, I notice that the London County Council put in six new pumps about 1917, running at 260 r.p.m. We have 10-in. pumps working at 450, 620 and 720 r.p.m., and I much prefer the lower speed for general results.

In putting down a centrifugal pumping scheme, it is desirable to have units of different capacity to suit varying flows, but it is possible to throttle down when running electrically without greatly reducing the efficiency. Considered generally, these are very convenient pumps for sewage lifting.

Reciprocating Pumps

When dealing with greater heads, there is much to recommend this type of pump with special reference to the single-acting ram pattern; but here again we have to consider the large amount of foreign matter contained in sewage and frequent trouble with valves. The fullway flap valve is the only possible one to consider, and even with these a piece of wood under the hinge will prevent its closing, with consequent loss of duty, and very close observa-

tion will be necessary to detect the difference occasioned by a partly-opened valve, but it will naturally increase the cost of lifting. No priming arrangement is necessary as with centrifugal pumps, but with the gritty matter the cylinders get badly scored and the upkeep is often costly.

Ejectors

This method is well known, and is usually adopted under special circumstances where no fall is available to obviate the costly laying of deep sewers. One advantage of the system is that a district can be divided into several sections, each draining to an ejector station and lifting automatically by compressed air generated at a central station.

There are several reliable makers of this type of lift, but the principle of them is all the same. An ejector is a hollow vessel varying from 50 to 1,000 gallons' capacity, and is placed in a chamber below the invert of the sewer. They are usually designed to fill and discharge once a minute. A 100-gallon ejector would therefore discharge 144,000 gallons in twenty-four hours. This, however, could be accelerated by increasing the size of the connections and the air pressure, the latter under ordinary circumstances being approximately 0.5 lb. per sq. in. per ft. of lift. In some cases single ejectors are used, in others they work alternately in pairs.

Although, as I have stated, the usual arrangement is to discharge once a minute, this is not necessarily the case. Some twenty-five years ago a plant was installed with 500-gallon ejectors, to be capable of discharging 750 gallons per minute, so that the ejector had to fill and discharge in 40 seconds. This plant, I understand, worked successfully.

The first public authority to adopt this system was Eastbourne. A plant to lift $2\frac{1}{2}$ million gallons per day was put down in 1880. Since then several additions have been made, and the installation is one of the largest in the country.

For economical working, ejectors require careful adjustment. There are, however, few working parts. There is very little wear, and the expense for repairs and renewals is small; the mechanical action is very simple.

Relative Efficiency

When considering the question of efficiency with reference to the lifting of sewage, one has to proceed carefully.

There is (1) the mechanical efficiency of the pump or ejector; (2) the overall efficiency, including the power employed, be it electric motor, steam, gas or oil engine, plus, in the case of the ejector, the air compressor; (3) the commercial efficiency; and (4) last, but not least, the sanitary efficiency.

The first and second are the difference between the foot pounds raised per minute divided by 33,000 and the h.p. consumed, and the third is the annual cost of lifting plus maintenance and capital charges. Cost of maintenance may vary considerably and by inference; the cheapest initial outlay may not be the most economical. Four may be described as work done with the least nuisance.

With regard to the overall efficiencies of the three methods, I have found it impossible to obtain any figures strictly comparable, so have recourse to such as are available. In the case of centrifugal pumps, I have utilized the results obtained in the trials referred to, which are as follows:

Pump efficiency	80	per cent
Overall efficiency	65.3	per cent

These are calculated on total head, which is the accepted method. I have also just for curiosity worked them out on the 11-ft. static head, and get:

Pump efficiency	42.8	per cent
Overall efficiency	34.6	per cent

The efficiency of the motor has been taken as 81 per cent.

For the efficiency of reciprocating pumps and ejectors I have taken the liberty of quoting from "The Efficiency of Pumps and Ejectors," by E. C. Bowden-Smith, M.I.M.E., who gives the results of tests of the former as 90.88 per cent and 92.8 per cent on a total head of 144 ft. and 134 ft. respectively and an output of 3,235 gallons per minute.

These are probably on the high side, being taken under favorable plant conditions. The engine was a quadruple expansion type 155 to 195 indicated h.p. direct coupled to a three-throw single-acting ram pump 21½ in. by 3 ft. Personally I should prefer to base calculations on about 75 per cent for a unit of moderate size. The latter was 36.2 per cent as the result of ejector stations raising 227,291,000 gallons with heads of from 41 to 46 ft. This overall efficiency includes loss in air mains, compressors and ejectors.

Messrs. Hughes and Lancaster claim that the mechanical efficiency of the "Shone" ejector is 98 per cent, the only loss being 1 per cent past the flap valves and 1 per cent leakage throughout the automatic valve.

The commercial efficiency is more difficult to calculate, and, I am afraid, cannot be reduced to figures; but undoubtedly the initial cost of centrifugal pumps is lower than either of the others, and if the lift is moderate and the mechanical efficiency can be maintained, would probably take first place.

The sanitary efficiency would in all circumstances be determined by local conditions. As an illustration it may be pointed out that an ejector station might be more hygienic than an underground pumping plant.

Factors to be Considered in Selecting Method

Local conditions must necessarily govern to a large extent the choice of method, and we can here use the old argument of the sanitary engineer in regard to sewage—that every town must be treated on its merits, there being no universal panacea. But I should like briefly to summarize my opinion as follows:

Centrifugal pumps for heads not exceeding 50 ft.

Reciprocating pumps for over 50 ft., and in cases where there is a long rising main.

Ejectors where there is no natural fall, and in water-logged subsoil where the cost of laying deep sewers would be prohibitive.

In practice it is stated 55 to 65 ft. head is the maximum for economical working, but 45 ft. is to be preferred, the frictional head on the cast-iron main accounting for a large percentage of the pressure; but this can be arranged by having subsidiary stations and thus reducing the working pressure.

There is one thing in connection with the running of ejectors that has struck me. It is necessary to keep up the air pressure for the maximum lift, although during certain times of the day the capacity of the compressor is greater than the requirements, and a cut-out device is usually fitted on the compressor so that it runs light. This on some systems may amount to many hours per day, and although the power consumed is small, nevertheless it adds to the total cost. It is difficult to avoid, as one cannot see the contents of the sewers. I know, of course, that in some cases it is usual to shut down during the slack hours of the day, but, given a gravitation and pumping scheme, one can arrange the pump units to keep pace with the flow, which is under observation the whole time, and I should like to hear suggestions for the solution of this difficulty. Abstract of paper read at the Annual Meeting of the Association of Managers of Sewage Disposal Works.

Speaking at the banquet of the Canadian National Clay Products Association last Wednesday in Toronto, J. B. Carswell, president of the Building and Construction Industries Association, said that "this business depression is an empty cocoon. I feel sure that the depression in our line is over, and in that I express the conviction of three hundred men who met at that convention. The element of the rise in British exchange would be an important factor in stimulating building by providing money. As soon as the exchange rights itself and money can come here without loss there will be an improvement," he said. With a building boom the industry would still have its problems. In Toronto, for instance, he doubted whether there would be enough building mechanics and certain material to meet the demands.

CLAY PRODUCTS ASSOCIATION HOLD ANNUAL MEETING

THE 20th annual meeting of the Canadian National Clay Products Association was held in Toronto on Feb. 7. The convention brought together a representative gathering of men prominent in the various branches of the clay products industry in Canada. President Ryland H. New of Hamilton in the opening address said: "The time has come when we must look ahead and broaden out in all lines of our work. With building conditions improving, the need of, and demand for, all lines of clay products will become greater, and it is for our own good that we produce the best possible article and satisfy the dealers, architects and the public with the quality of the goods they are buying."

Prof. W. G. Worcester, of the University of Saskatchewan told of the extensive work started in that province. A survey which had been commenced already has shown Saskatchewan to be exceptionally rich in the natural resources necessary for clay and brick products. Tests so far made had shown the existence of fire clays, china clays, terra cotta clays and clays suitable for the manufacture of paving, brick and buff and red-faced brick, and for the uses of paint and paper manufacturers. Officers elected were: President, Ryland H. New, Hamilton (re-elected); 1st vice-president, T. H. Graham, Inglewood; 2nd vice-president, Andrew Dods, Mimico; 3rd vice-president, D. C. Merkeley, Ottawa; Secretary, Gordon Kelth, Toronto and Councillors W. J. Nicholson, Toronto; H. H. Hallatt, Tillbury; F. B. McFarran, Toronto; Ray Price, Humber Bay; N. T. Canon, Montreal; C. B. Lewis, Toronto; C. H. Wallace, Toronto, and Robert New, Hamilton.

The Koehring Company of Canada, Ltd., has just been organized with a Dominion charter with head office at 105 Front St. E., Toronto. It is the purpose of this company to handle the sale of Koehring construction type mixers, Koehring pavers, Koehring cranes and other construction and industrial plant equipment including Whitcomb gasoline and storage battery locomotives, C. H. & E. saw rigs, pumps, hoists, etc. The company will carry a complete stock of Koehring mixers and pavers together with a stock of spare parts for these same machines. By this means the purchasers of Koehring products and other products sold by the Koehring Company of Canada will be assured of prompt and satisfactory service by men who are fully experienced in this class of work and who are alive to the requirements of engineers and contractors who are interested in the use of machinery of this kind.

A bill has been introduced before Congress at Washington, by Representative Reed, of New York, to authorize the construction of a ship canal from Lake Erie to Hudson River. The canal as proposed will be 30 ft. deep and 300 ft. wide. It will have one terminal at Buffalo and the other on the Hudson River at Kenwood, near Albany.

BEFORE AFTER
Or, What the Good Roads Movement Means in Ontario

ANNUAL CONVENTION OF ASSOCIATION OF DOMINION LAND SURVEYORS

Report of Fifteenth Annual Convention Held in Ottawa—
Association in Flourishing Condition—Several Interest-
ing Papers Read at Sessions—Election of Officers

THE fifteenth annual convention of the Association of Dominion Land Surveyors was opened on Wednesday, morning, Feb. 1, in Victoria Museum, Ottawa, with about 90 delegates, representing the membership of the association in Ontario, Quebec, and the Western provinces in attendance. The president, G. H. Blanchet, Ottawa, in a few well chosen words welcomed the visiting members to the convention and expressed the hope that they would find the proceedings of the meetings both interesting and instructive.

President's Address

The President reviewed the work of the surveyors from the earlier periods contrasting the differences in the nature of the first surveys to those which are required to meet the developments of settlement in the Western provinces at the present time. He said the pressing need in the early settlement of the country was to mark the boundaries ahead of the squatters and homesteaders, but as the great plains of fertile lands were surveyed and settled a new field of service was opened up to the surveyor. It became necessary to explore the land and examine it with a view to determining its possibilities as an agricultural district and to define more or less definitely the limits of such areas.

This matter became acute when the Government undertook a soldier settlement scheme to provide homes for the men who had defended our country in the late war. Large areas were examined and reported upon and the Department was able to select lands where the settler had a reasonable chance of success.

Mr. Blanchet also pointed out that surveyors should learn to impart to the public in an interesting and forcible manner, the information they gather relative to the country covered by their work.

T. B. Spieght, Toronto, and Jacob L. Doupe, Winnipeg, expressed their appreciation of the work of the association.

The Secretary's report was submitted showing a membership in excess of 225 and a strong financial condition.

Speakers at Annual Luncheon

The annual luncheon on Wednesday in the Chateau Laurier was attended by 115 members and their guests, and in every way was one of the most successful ever held by the association. Among the guests were the Hon. Chas. Stewart, Minister of the Interior; Dr. E. Deville, Commissioner of Dominion Land Surveys; Dr. W. J. Roche, Chairman Civil Service Commission, and others prominent in professional and departmental work.

The Minister of the Interior in a short address spoke of the work of the surveyor, pointing out that in addition to his technical duties it was necessary, at times, for him to exercise great diplomacy in dealing with cases of disputed boundaries between settlers. He spoke also of the difficulties confronting this country in getting back to normal conditions after the great war but assured the audience that Canada was making good progress and that Western Canada offered great opportunities to the young man who was willing to work. Work, he said, and co-operation, would soon solve the financial difficulties of the country.

Dr. Deville spoke of the different branches of survey work, giving a brief outline of the extent of the precise levelling operations, topographical and revisional surveys along the Mackenzie where 4,000 miles were surveyed last season and other miscellaneous classes of work.

Dr. Roche in his usual happy manner mentioned the Imperial Conference and the Peace Conference pointing out that Canada was taking her place in the world councils. He also invited the co-operation of the association for the

purpose of improving the general efficiency of the Civil Service.

Papers Read at Afternoon Session

In the afternoon addresses were given by Capt. Forrester and Mr. Lloyd, of the Dominion Parks Branch, on "Our National Parks and Bird Sanctuaries." In the course of his remarks on "Bird Sanctuaries" Mr. Lloyd pointed out, that, to protect our birds, two things were necessary, viz., protection of the breeding grounds and closed seasons for shooting. Surveyors, he said, in view of their wide travels in the wilds should be able to render valuable assistance, by reporting to the Government, the location of breeding grounds of the birds. Continuing he pointed out that the "Trumpeter Swan" and the "Whooping Crane" (white turkey) were nearly extinct. Recently 19 of these swans were found in Alberta and these, he said, were the only ones known to exist.

L. J. Bowes gave a short paper on Hydrographical Surveying in James Bay. He explained in detail the methods adopted in carrying out soundings, and pointed out the great need of properly charted waterways. Canada should be proud of her waterways and the manner in which they were buoyed and lighted.

Paper on Photographic Surveying

Perhaps one of the best papers given at the Convention was that presented by M. P. Bridgland on Photographic Surveying. His paper, although necessarily of a technical nature, was clear and explained the work fully from the manner of selecting the camera stations to the completion of the map. Photographic methods, he said, were not applicable to every class of country but was particularly adapted in rugged country and where it is desired to cover large areas at a low cost. The instruments used in the field are the transit and the camera which are especially constructed for transport in climbing mountains. Wratten & Wainwright panchromatic plates $4\frac{1}{4}$ in. x $6\frac{1}{2}$ in. are used. These plates are very sensitive and excellent pictures are obtained. Special instruments for plotting have been devised and Mr. Bridgland, by a number of slides, gave a clear description of these models. He explained the manner of control by triangulation and how the position and elevation of points were determined from the photos. Storms and unfavorable weather conditions in the high altitudes were, he said, some of the greatest difficulties to overcome. A number of slides showing the mountains in all their wild grandeur were very much appreciated by the large audience. A full report of Mr. Bridgland's paper will appear in a later issue of "The Canadian Engineer."

Another interesting and instructive paper "A Trip Down the Mackenzie" was presented by F. V. Seibert. In illustrating his address Mr. Seibert used over 100 slides from which one could obtain a really good idea of the great river and the country of the promised "Oil Wells." The views covered a distance of 1400 miles from Fort McMurray to Carceyon river, 105 miles below Norman.

In addition to showing views of the country Mr. Seibert explained the manner of transport of the government survey parties down the river and by means of some excellent views was able to convey to the audience a clear understanding of the pleasures, hardships and adventures encountered on these trips. Mr. Seibert explained also the methods adopted in carrying on the survey down the river in which three parties in $2\frac{1}{2}$ months actually surveyed over 4,000 miles of shore line.

Work of Air Board in Canada

In the evening an illustrated lecture by J. A. Wilson on the "Work of the Air Board in Canada" was much appreciated by a large audience of surveyors and their friends. Mr. Wilson explained that Canada possessed a large number of trained flyers and while it was impossible to maintain a large military force of aeroplanes it was hoped that useful work could be found for a number of officers and men. Aviation comprised three classes, civil, defence and commercial. In Canada the absence of large centres

of population mitigated against commercial aviation, but he said that in the near future Montreal and the Pacific would be connected by aeroplane.

The Air Board had taken over Camp Borden and here provided instruction for those wishing to enter the school. About 30 officers and 200 men were actually employed, but Canada could provide in case of need 5,000 officers and men. 500 officers and 1,100 men had passed through the school during the last 15 months.

Mr. Wilson explained the work done by the air service in connection with forest patrol and told of instances where small outbreaks of fire were detected and put out before any damage could be done.

Another phase of the work was assisting in fisheries control for the prevention of poaching and also the mapping of the St. Lawrence for the International Waterways Commission.

Officers Elected for Ensuing Year

Officers elected for 1922 were as follows: President, G. H. Herriot, Winnipeg; vice-president, D. H. Nelles, Ottawa; sec.-treas., W. L. MacIquham, Ottawa; Councillors for Ottawa; J. W. Pierce, Ottawa; B. H. Segre, Ottawa; A. M. Perry, Ottawa; J. E. R. Ross, Ottawa; T. H. G. Clunn, Ottawa. Councillors for Quebec: E. F. Gorman, Buckingham, Que. Councillors for Ontario: E. P. Bowman, West Montrose, Ont., and T. W. Beattie, Pembroke, Ont. Councillors for Saskatchewan: W. M. Stewart, Saskatoon, Sask., and W. R. Reilly, Regina, Sask. Councillors for Alberta: H. E. Pearson, Edmonton, and J. B. Alexander, Calgary. Councillors for Manitoba: W. E. Hobbs, Winnipeg, and C. E. Joslyn, Winnipeg. Councillors for British Columbia: J. E. Umbach, Victoria, and E. C. Coursier, Revelstoke.

UNIVERSITY OF MICHIGAN HIGHWAY CONFERENCE

AN interesting program has been arranged for the eighth annual conference on Highway Engineering which will be held at the University of Michigan, Ann Arbor, Mich., on February 13 to 17, 1922. The conference will be held under the direction of the College of Engineers in co-operation with the Michigan State Highway Department. The program is as follows:

Monday, February 13, 8:00 a.m.

Registration, Room 407, Engineering Building.

Monday, February 13, 2:30 p.m.

Henry E. Riggs, Professor of Civil Engineering, University of Michigan, presiding.

"New State Standard Cross-Sections, Shallow Ditches and Sub-Drainage," Leslie H. Belknap, Deputy State Highway Commissioner of Michigan.

"State Investigations Covering Grade Reductions," V. R. Burton, District Engineer, Michigan State Highway Department, and Walter E. Lay, Assistant Professor of Mechanical Engineering, University of Michigan.

Monday, February 13, 8:00 p.m.

Moving Pictures of Road Machinery and Highway Construction Methods, Room 348, Engineering Building.

Tuesday, February 14, 9:30 a.m.

Frank F. Rogers, State Highway Commissioner of Michigan, presiding.

"Controlling the Quality of Materials in Highway Construction and Maintenance," John H. Bateman, Director, State Highway Laboratory, and Assistant Professor of Highway Engineering, University of Michigan.

"Efficient Methods of Providing for Traffic During Highway Construction," A. R. Hirst, State Highway Engineer of Wisconsin.

Tuesday, February 14, 2:00 p.m.

G. C. Dillman, Maintenance Engineer, Michigan State Highway Department, presiding.

"Plant Inspection, a Necessity to Insure Good Bituminous Pavements," Francis P. Smith, Consulting Paving Engineer, New York City.

"Developments of Constructing Brick Pavements," Arthur H. Blanchard, Professor of Highway Engineering and Highway Transport, University of Michigan.

Tuesday, February 14, 8:00 p.m.

Smoker: Michigan Union, Second Floor, Henry E. Riggs, Professor of Civil Engineering, University of Michigan, presiding.

"Michigan as a Summer Resort," Hon. H. S. Earle, former State Highway Commissioner of Michigan.

Violin Solo by M. L. Casman, Roy D. Chaplin, Fellow in Highway Transport.

Songs by Highway Engineering Students.

Musical Selections by Rogers' Orchestra.

Wednesday, February 15, 9:30 a.m.

Arthur H. Blanchard, Professor of Highway Engineering and Highway Transport, University of Michigan, presiding.

"Bituminous Surfaces on Gravel Roads," Paul D. Sargent, Chief Engineer, Maine State Highway Commission.

"State Investigations Covering Dust Prevention on and Preservation of Gravel Roads," G. C. Dillman, Maintenance Engineer, Michigan State Highway Department, and Herschel C. Smith, Assistant Professor of Highway Engineering, University of Michigan.

Wednesday, February 15, 2:00 p.m.

L. H. Nelson, Deputy State Highway Commissioner of Michigan, presiding.

"Comparison of Sub-Drainage by Deep Side Ditches and Tile Drains," Charles M. Upham, State Highway Engineer of North Carolina.

"Organization, Management and Methods of Snow Removal from Highways Outside of Municipalities," Charles J. Bennett, State Highway Commissioner of Connecticut.

Wednesday, February 15, 8:00 p.m.

Moving Pictures of Road Machinery and Highway Construction Methods, Room 348, Engineering Building.

ROAD COMMISSIONERS' MEETING

Thursday, February 16, 9:30 a.m.

Frank F. Rogers, State Highway Commissioner of Michigan, presiding.

Reports of representatives of the County Highway Departments of Michigan.

Thursday, February 16, 2:00 p.m.

Leslie H. Belknap, Deputy State Highway Commissioner of Michigan, presiding.

"Distribution of State Reward Funds," Frank F. Rogers, State Highway Commissioner of Michigan.

"Maintenance of State Trunk Line Roads in Calhoun County," G. W. Schneider, Chairman, Calhoun County Road Commission.

Thursday, February 16, 6:00 p.m.

Informal Dinner of Michigan Road Commissioners' and Engineers' Association: Banquet Hall, Michigan Union. President, G. W. Schneider, presiding.

Friday, February 17, 9:30 a.m.

Filbert Roth, Professor of Forestry, University of Michigan, presiding.

"Appearance of Highways," C. F. Boehler, Landscape Engineer, Michigan State Highway Department.

"Useful Roadside Planting," Hon. W. S. Linton, Saginaw, Michigan.

"Growth of Roadside Trees," A. K. Chittenden, Professor of Forestry, Michigan Agricultural College.

"Relation of Roadside Development to Telephone Companies," B. R. Marsh, Division Plant Superintendent, Michigan State Telephone Company.

Commissioner of Works Andrew F. Macallum, of Ottawa, has been instructed to find a street railway expert to co-operate with the City of Ottawa in drafting a new franchise agreement with the Ottawa Electric Railway.

ALTERATIONS TO OLD BOARD OF TRADE BUILDING, TORONTO

Interior Bearing Walls Removed and Columns and Girders Substituted. Old Structural Steel Found to Be in Perfect Condition

VERY extensive alterations to the interior of the old Board of Trade building, at the corner of Yonge and Front streets, Toronto, Ont., have been almost completed. Three storeys are to be added to the old eight-storey building and a ten-storey addition is to be built adjoining the present building. The extensive use of structural steel throughout the operations has made it possible to change this old out-of-date building into an office building of the highest class. Although thirty-five years have elapsed since the old structural steel was erected, it is in such good condition that many beams which were removed were put back into the new work; some of the old beams being found to be of a size and weight that are no longer manufactured.

The Board of Trade building was built about thirty-five years ago and is of the bearing wall type. The floors consist of a flat tile arch resting on steel-I-beams in turn rest on bearing walls. A few cast iron columns were used between the first floor and second floor to give a clear space on the ground floor. They were marble covered and set in a circle in the centre of the building. Above these columns the interior bearing walls ran up to the sixth floor.

Around the curved front of the building were a few built-up columns running from the basement up to, and carrying, the trusses that support the large dome. These columns were not in the outside walls but were offset about eighteen inches from them. In the basement storey several cast iron columns were found supporting the steel I-beams about 4 ft. from the walls. This is a very unusual piece of construction and there seems to be no reason why such a method should be employed unless it was to take some of the load off the walls on a separate footing and shorten the length of the span of the I-beams. If this were true it was a case of a very doubtful economy. This condition obtained also near of the interior bearing walls where columns were placed under some of the floor beams a short distance from the wall. The peculiar part of it is, however, that these columns ran only for a floor or two at one time and then when they were continued after missing a storey or two they were not directly above the lower columns. Why these columns were put in, no one seems to know but it shows how much the art of designing steel structures has progressed in the last few years.

The major portion of the alterations was the removal of all interior bearing walls, replacing them with steel columns and I-beams, the floors being left intact. It was a very complicated piece of reconstruction as there were no plans available and when the survey and preliminary plans were made the tenants had not moved out so that the position of the floor beams had to be determined from the ceiling of the basement, the upper floor beams being assumed to be in the same relative position. As the work progressed, however, it was found that this was not the case and each individual column and beam had to be treated independently and most of the connections were designed on the job.

In place of shoring all the floors at the same time from the bottom to the roof, as is very often done in a case of this kind a new idea was employed to take out the bearing walls without disturbing the floors. The columns and foundations were designed to carry the future floors and were spliced at every floor. The work of placing the columns was commenced in the basement. Here directly above the column foundation, needles were inserted through the wall and enough of the wall removed to allow the foundations to be placed. When the grillage had been placed, the hole in the wall was bricked up with the exception of a chase left in the wall in

which the column was placed from the basement to the first floor. The second floor was shored up around the column, a chase cut in the wall, and the second tier column placed. This operation was repeated for every floor to the roof, temporary steel supports being provided for any beams that were intercepted by the new column. In some cases the new column ran through one of the old steel beams and it was necessary to cut a piece out of the beam to allow the column to pass. The beam being temporarily supported on the new column.

After the columns had been erected the roof was shored up and the walls were torn down to the next floor. Steel girders were inserted to take the place of the wall and the roof beams were framed into girders. These new girders at the roof level was placed at the elevation of the new floor that is to be erected and consequently only temporary bolted connections were used for the present roof beams. Shores were placed under the floors, the walls torn down and girders erected to take their place till all the old bearing walls were removed.

The round circular portion where the vaults were located, was treated in a similar manner but it presented a more difficult problem in that it was necessary to remove the columns supporting the dome trusses and the beams framing into these columns had to be taken care of. On account of the peculiar shape of the building, very often as many as six or seven beams framed into the column from different directions and the majority of these had to be burned off and spliced, using often, a bevelled connection to transfer the load to the new column.

The whole operation was a tedious one as it was impossible to design the steel or connections till the floor and wall was torn up and most of the work was done in the field. The steel contractor kept a man constantly using the oxy-acetylene flame burning off beams and columns from the time the first piece of steel was erected.

The remarkable accuracy with which structural steel can be erected under most impossible conditions is demonstrated by the fact that the maximum amount any column was out of plumb in the eight storeys was one-half inch.

The present contract called for the tearing out of the interior bearing walls and replacing them with steel beams and columns while the remodelling of the dome, the addition of three new storeys and the erection of a ten-storey addition to the east of the present building is included in a new contract which is out for tender now.

The engineering as well as the architectural work is being handled by Messrs. Dowsell and Dolphin, architects. The Carswell Construction Co., are the general contractors, and the structural steel is being supplied and erected by The Dominion Bridge Co. Ltd., Toronto. Great credit is due the latter company for the efficient manner in which the work was handled under very trying conditions.

Speaking in Hamilton, Ont., recently the Hon. F. C. Biggs, Minister of Public Works for Ontario, said that by July 1 he hoped to have the Hamilton entrance of the Toronto-Hamilton Highway completed. Early in the year, it was expected, he added, to have the Hamilton-St. Catharines Highway finished, and the Hamilton-Brantford Road, which drives would connect Toronto, Owen Sound, Welland, Dundas Street, Guelph and other centres.

In the United States approximately \$400,000,000 was spent on road construction in 1919; in 1920 about \$600,000,000, and it is estimated that for 1921 approximately \$800,000,000 was spent. For this year nearly one and one-half billion dollars are available for road construction and it is expected that actual cash expenditures will pass the billion dollar mark. More money is now being spent on road construction than on all other public works combined.

CONFERENCE ON ROAD CONSTRUCTION

THE Eighth Annual Conference on Road Construction for county road superintendents and engineers will be held in the Parliament Buildings, Toronto, on Monday and Tuesday, February 27 and 28, 1922.

During the same week, viz., on March 1, 2 and 3, the Twentieth Annual Meeting of the Ontario Good Roads Association will be held in the York County Buildings, 57 Adelaide Street East, Toronto.

The accompanying programme gives an outline of the subjects which will be discussed at the Conference on Road Construction. Each subject will be introduced by a short address by the speakers whose names are shown on the programme, and the meeting will then be open for discussion.

The county and township road superintendents and engineers are strongly urged to arrange to be present at all of the sessions of the Conference, and also to attend the meeting of the Ontario Good Roads Association.

The Department of Highways requests that all those planning to attend the Conference will indicate their intention by letter as soon as possible, in order that a sufficiently large lecture room may be secured. All communications should be addressed to the conference chairman, W. A. McLean, Deputy Minister of Highways, Toronto.

MONDAY, FEBRUARY 27TH

Morning Session

10:00 a.m.—"Road Drainage," Geo. McCubbin, county engineer of Lambton.

Discussion introduced by U. W. Christie, Dufferin county engineer, and J. G. Cameron, county engineer of Stormont, Dundas and Glengarry.

11:00 a.m.—"The Beautifying of our Highways," H. J. Moore, Forester, Department of Public Highways.

Afternoon Session

2:00 p.m.—Address, Hon. F. C. Biggs, Minister of Public Works and Highways.

3:00 p.m.—"Concrete Bridges and Culverts," W. J. Moore, Renfrew County Engineer.

Discussion introduced by John Young, Wellington County Road Superintendent, and W. J. Kean, Ontario County Engineer.

TUESDAY, FEBRUARY 28TH

Morning Session

9:30 a.m.—"Concrete Road Surfaces," L. A. Pardo, Kent County Road Superintendent.

Discussion introduced by L. S. Lichty, Waterloo County Road Superintendent.

11:00 a.m.—"Gravel and Stone Road Maintenance," Frank Pineo, Elgin County Road Superintendent.

Discussion introduced by R. H. Fair, Frontenac County Road Superintendent, and S. Fox, Hastings County Road Superintendent.

Afternoon Session

2:00 p.m.—"Bituminous Road Surfaces," Alan K. Hay, Engineer to Ottawa Suburban Road Commission.

Discussion introduced by G. Marston, Norfolk County Engineer, and Wm. Waters, Lanark County Road Superintendent.

3:30 p.m.—"The Early Preparation of County Road Programmes," Frank N. Rutherford, Lincoln County Engineer.

Discussion introduced by E. L. Miles, Victoria County Engineer, and N. L. Powell, Peel County Engineer.

A two-day session, with interesting papers, discussions and an address from Hon. F. C. Biggs, Minister of Highways, has been arranged for the eighth annual conference on road construction, which meets in Toronto on Monday and Tuesday, February 27 and 28. During the same week, March 1, 2 and 3, the twentieth annual meeting of the Ontario Good Roads Association will be held in the York County Buildings.

NEW PUBLICATIONS

A Compilation of Town Planning Legislation by Horace L. Seymour. A re-print of an article bearing this title which appeared recently in "The Canadian Engineer," embodying a compilation of Ontario legislation dealing with Town Planning methods. The compilation represents the author's efforts to get together material in a comprehensive form so that Ontario town planning legislation can be reviewed and readily compared with that of other provinces and countries.

The Canadian Ingersoll-Rand Company has just issued bulletin No. 10102 which is devoted to the illustrating and describing of their Price-Rathbun type oil engine. These engines are the vertical, single-acting, direct injection type operating on a four stroke cycle. Very minute and interesting details of the method of construction of these engines are given in the pamphlet which contains twenty-eight pages. The oil engine is fast coming into its own as a prime mover and to those interested this bulletin will be found very valuable. It is very adequately illustrated and altogether an attractive piece of trade literature.

The Pelton Water Wheel Co., of San Francisco and New York, has issued Bulletin No. 17, "Pelton Water Wheels (Impulse Turbines) and Reaction Turbines." The bulletin describes the various types of hydraulic equipment manufactured by the company, and discusses their application both to the generation of hydro-electric power and to the direct operation of many different kinds of machinery. Some space is also devoted to governors and to pressure regulating devices. The bulletin comprises 48 pages and is illustrated by a number of drawings and photographs. Copies may be obtained upon application to either office of the company.

Multi-Type Condensers. Bulletin No. 9032, issued by the Canadian Ingersoll-Rand Co., Sherbrooke, Que., describes their low level multi-jet type condensers for steam plants. In this type of condenser the most efficient action is obtained with multiple jets giving a large exposed surface for condensation. The bulletin describes fully the construction and method of operation and deals at length with the high vacuum produced with this type of condenser; in this connection an efficiency and capacity chart is shown of a centrifugal pump working at different suction lifts. Copies of this bulletin, which is fully illustrated, may be obtained from the head office of the company or from any of the branches.

The Canadian Municipal Equipment Corporation, Ltd., Bank of Hamilton Bldg., Toronto, has just issued a most interesting booklet illustrating and describing the "Otterson Auto-Eductor," the new and sanitary method of cleaning catch basins. This machine has again and again demonstrated its usefulness and superiority over the old flush method of cleaning catch basins and will undoubtedly appeal to city engineers and others responsible for the maintenance of sewers. The utilitarian character of this piece of equipment, in addition to its usefulness in cleaning catch basins, will be evidenced when it is stated that for very little extra cost the machine can be made to function as a street flusher, sprinkler and in some instances it has been used as an emergency pumper, auxiliary to the fire department. The pamphlet contains 16 pages and is well illustrated, and all those who have to do with the problems of sewer maintenance would do well to write for a copy.

At a meeting of the Alberta Association of Architects Professor C. S. Burgess of Edmonton was elected president. Other officers chosen were: George Fordyce, Calgary, first vice-president; E. W. Morehouse, Edmonton, second vice-president; A. M. Calderon, Edmonton, representative to the senate of the University of Alberta; E. Underwood, Edmonton, secretary; W. G. Blakey, Edmonton, treasurer; F. Vigers and J. Martland, auditors.

BRIDGES VERSUS TUNNELS

PROMPTED by the agitation for the construction of a combined railway and highway bridge over the North river at New York at a time when the new vehicular tunnel is in process of construction, there has arisen a vigorous discussion of the respective merits of bridges and tunnels for crossing navigable waters. While some engineers who have had special experience in one or other of the two fields of construction involved are disposed to take a somewhat partisan attitude in favor of the type of construction with which they are most familiar, it should be recognized that there is no hard and fast rule applicable to all crossings and to all classes of traffic by which the economic relation of these two types of project can be forecasted in an offhand manner. There is too great a disposition to advocate the construction of a bridge or a tunnel because in some other locality such a work has been successfully carried out and put into operation. What is suitable for one situation may be entirely unsuitable for another. One which might have some points in common with the first. Even for the same general district both bridges and tunnels have been built and probably there was merit in each for the particular site. Thus, there are both bridges and tunnels across the East river at New York, across the Chicago river at Chicago and across the Thames at London and the Seine at Paris.

A basic point that should not be forgotten in economic comparisons of this kind is that the facilities offered by the competing bridge and tunnel should be exactly equal. It affords no true indication of the respective merits of these two types of works to pit a double track railway tunnel against a double track railway bridge

providing also facility for highway traffic. Not only should the same number of tracks and the same total widths of roadway be provided in the two schemes, but the arrangement should be such that equal movements of traffic could be accommodated, if the comparison is to be a fair one. Thus, it cannot be said that two single roadway tunnels would be equivalent in traffic facility to one bridge roadway proportioned for two lines of traffic. In the first instance a breakdown of a vehicle in one of the single roadway tunnels would completely block traffic in that direction, whereas on a bridge, traffic could be kept moving by making detours around the stalled vehicle.

Comparison of the economic characteristics of tunnel transport with that provided by a bridge usually results in pitting several small tunnels against one bridge. This arises from the fact that the cost per lineal foot of a tunnel varies nearly as the square of the diameter, and it is therefore advantageous to keep the diameter small. So far it has not been found advantageous to use an outside diameter of the shell greater than 30 ft., which was the diameter used for the Rotherhithe tunnel under the Thames in London.

The height of the shores in the vicinity of the crossing has an important bearing on the relative economy of bridges and tunnels. If the shores be low and if a considerable overhead clearance has to be provided for ships, the profile is favorable to the tunnel in that less deviation from grade in the vicinity is necessary and the approaches are much shorter. If, on the other hand, the shores are high and a large overhead clearance for ships must be provided, the situation is favorable to the bridge for a corresponding reason. For situations such as exist at the Canal St. crossing at New York where the shores are fairly low and the clearance for ships must be high, the amount of energy consumed in hauling loaded vehicles up from a dip of perhaps 90 ft. below water level is manifestly much less than in hauling them up a bridge approach to an elevation of perhaps 150 ft. above water level.

Some advantage accrues to the tunnel through the possibility of extending the service provided thereby by the simple expedient of constructing several more tunnels, whereas it is usually difficult to increase the capacity of a bridge once built. This, however, is not impossible if the bridge is originally constructed so as to provide for the addition of another traffic deck.

In general it may be said that the cost of approaches for a bridge carrying steam railway traffic is higher than for a tunnel carrying the same class of traffic. At the same time property damages are also more. The maintenance charges for a tunnel so far as keeping it in condition is concerned are much less for tunnels than for bridges, but, on the other hand, the operating costs, apart from the loss of energy in hauling traffic up heavier grades for a bridge, are greater for the tunnel. The matters of lighting and ventilation do not, of course, enter into the bridge project in any important degree.

While electrically operated tunnels may accommodate the traffic with no more risk than is involved in the operation of a bridge, considerable concern is expressed by many engineers with respect to the practicability of operating vehicular tunnels accommodating motor driven traffic. Everyone is familiar even in the open with the large amount of gas given off by motor vehicles, and fears are expressed lest the breakdown of a motor vehicle in a tunnel or the possible burning of one might not bring about a disaster of unparalleled magnitude. Investigation has shown that a considerable quantity of carbon monoxide is given off by motor vehicles, and apart from the combustible character of this gas, its cumulative poisonous effects are well established. It is evident, therefore, that a vehicular tunnel of any appreciable length cannot be operated safely without a most efficient and reliable system of forced ventilation. The disagreeable atmosphere in the Rotherhithe tunnel accommodating relatively few motor vehicles without forced ventilation is an indication of the necessity of such equipment.

It should be stated, however, in fairness to those charged with the construction of the vehicular tunnel under the Hudson river that the decision to construct a tunnel was not arrived at without conducting the most exhaustive investigations with respect to the possibility of keeping the atmosphere in the tunnel in a sufficiently pure state to make traffic safe. Investigations carried out through the co-operation of the University of Illinois and Yale University with the United States Bureau of Mines have shown that a carbon monoxide content of four parts in ten thousand, would not be injurious to persons using the tunnel. The engineers therefore have definite experimental evidence upon which to base their provisions for ventilation, but at the same time it must be admitted that a risk is being taken in this matter which does not need to be taken in the construction of a bridge.

Apart from the hazards, either real or imaginary, of vehicular tunnel construction and the relative opening difficulties the economic facts of the situation should control the adoption of the type of crossing. Experience gained through the construction of many such works has shown that while tunnels are likely to be cheaper for steam railway and electric railway traffic they are more expensive than bridges for highway traffic. The deeper the navigable water crossed and therefore the longer the main bridge span needs to be, the more is the tunnel favored, but even up to about a 3,000-ft. span the bridge is economically superior to the tunnel for highway traffic. Appreciation of this fact has led some engineers to propose that railway traffic both steam and electric for crossings of navigable waters be carried across through tunnels, and highway traffic be accommodated by bridges. The heavier grades necessitated on the bridge do not much concern the autoist either in the matter of fuel consumption or time lost, but they do vitally concern the railways. Wherever the possibility of the use of short spans for a bridge crossing exists, a bridge will be decidedly of advantage as compared with tunnels, and even though the span be very long, as has been already noted, the highway bridge is able to compete to advantage with the tunnel.

An important feature of the situation is the greater risk and cost uncertainty involved in the construction of tunnels. Commenting on the whole situation of bridge vs. tunnel, "Engineering News" observed some years ago while the Pennsylvania tunnels for the New York entrance were under construction, that there was reason to believe that if the Pennsylvania Railroad had known before earmarking on the venture all that it knew at the time of writing concerning the relative costs of ridges and tunnels, that it would have chosen bridge entrances to Manhattan.

PERSONALS

RYLAND H. NEW, of Hamilton, Ont., has been elected president of the Canadian National Clay Products Association.

G. H. DUNCAN, of Peterborough, Ont., has been elected president of the Peterborough Builders' and Supply Association.

WILLIAM P. DALE has been appointed township engineer and road superintendent for the Township of Stamford, Ont.

HON. HEWITT W. BOSTOCK, who recently retired from the Ministry of Public Works in the Dominion Government, has been appointed Speaker of the Senate. Senator Bostock will take over his new office at once.

DR. MILTON HERSEY and E. DAOUST have been appointed Harbor Commissioners to the Port of Montreal. Both the new commissioners are residents of Montreal and have taken an active part in the commercial life of that city. Dr. Hersey is president of Milton Hersey Co., Ltd., Montreal, industrial chemists and consulting engineers, and conducts one of the largest testing laboratories in Canada.

MAJOR ROBERT MCKNIGHT, of Owen Sound, Ont., has been appointed engineer for the County of Grey. Major

McKnight graduated from McGill University and the Royal Military College, Kingston. He was for some years employed on construction of the Grand Trunk Pacific and was later engaged upon engineering work in the West. Major McKnight went overseas with a Western unit in 1914 and returned to Owen Sound at the conclusion of hostilities.

PROF. H. R. CHRISTIE has been appointed professor in the faculty of forestry at Toronto University. Prof. Christie is at present Professor of Forestry in the University of British Columbia. He graduated from the University of Toronto in 1912, and was for a time connected with the Forestry Department of the British Columbia Government. During the war he was with the Canadian Engineers in France, where he was wounded, and later with the forces in Siberia.

W. A. ALEXANDER has been appointed district engineer in charge of the Helena, Montana, office of the Portland Cement Association. Mr. Alexander's experience in the engineering and contracting field extends over a number of years, and covers railroading, irrigation, drainage and hydro-electric engineering. About a year ago Mr. Alexander entered the employ of the Portland Cement Association, and has since been conducting educational and promotional work in Southern Idaho.

COL. R. W. LEONARD, M.E.I.C., of St. Catharines, Ont., has been presented with the Leonard medal. For two years past this medal has been awarded, but the first presentation of these medals was made in Montreal last week. The other one will be presented to E. F. Campbell, of British Columbia, the first winner of the award. The medal is in the shape of a gold nugget and was donated by Col. Leonard for the best annual paper presented before the Engineering Institute of Canada or the Canadian Institute of Mining and Metallurgy.

HON. WILLIAM C. KENNEDY, who was recently appointed Minister of Railways and Canals in the Dominion Government, was born at Ottawa, Ont., on August 27, 1868. He was educated at Separate School and De La Salle Institute, Toronto.

Mr. Kennedy began his business career in Toronto in 1887 with the London and Canadian Loan & Agency Co., but left in 1897 to engage in the gas & oil business at Windsor, Ont., ultimately becoming president of the Windsor Gas Co. In recognition of his work in the interests of the manufacturers in that district, Mr. Kennedy was appointed president of the Windsor Board of Trade in 1909 and a Trustee of the Windsor Board of Education for 1913-1918. Mr. Kennedy began his political career in 1917, when he was elected to the Federal House of Commons in the Liberal interests, representing North Essex. He was again returned for the same constituency in December, 1921, and shortly afterwards accepted the portfolio of Minister of Railways and Canals.

By the end of 1922 it is hoped that the highway from Pembroke, Ont., to Sault Ste. Marie, Ont., will be completed.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

Alberta, Province of.—The government has been asked to bring down a bill at the next session of the legislature, providing for a bond issue of \$2,250,000, ear-marked for the construction of roads in the province.

Barton, Tp., Ont.—The Township Council decided to macadamize the road on Inverness Ave. Clerk, A. G. E. Bryant, Hamilton.

Beamsville, Ont.—The Town Council decided to have a 4-in. water main in West Ave. and to extend the main in William St. to James St. Clerk, W. D. Fairbrother.

Birch Cliff, Ont.—An Appropriation of \$45,000 for road expenditures was decided upon by Scarboro Township Council. That amount will be used chiefly for gaveling work. Clerk, W. D. Annis, Scarboro.

Bridgeburg, Ont.—The Welland County Council has approved of the project to erect a bridge connecting Fort Erie with Buffalo, either at Ferry St. or a point south of that. The former would cost about \$2,500,000, while the latter would cost \$7,000,000.

Cobourg, Ont.—The Durham and Northumberland Council appropriated \$120,000 for expenditure on county roads this year. Road Superintendent, George Greer, Cobourg.

Galt, Ont.—An announcement was made here recently by N. Asmussen, M.L.A. for North Waterloo, that the Department of Highways intends proceeding with the paving of the Preston-Kitchener road early this spring.

Glencoe, Ont.—The Town Council intends to construct over a mile of concrete sidewalks. Clerk, Charles George.

Gloucester Tp., Ont.—Application for the erection of a new bridge over the C.P.R. tracks may be made to the Railway Commission.

Hamilton, Ont.—A movement is on foot for the construction of a driveway along the waterfront, from Catharine St. east to the intersection at Wentworth and Burlington Streets. The harbor commissioners favor the project.

Hamilton, Ont.—The City Council intends to construct a cement walk on Ottawa St. at a cost of \$1,008.12; cement walk and curb on London St., \$608.40; and cement walk and curb on Burlington St., \$2,416.93. City Clerk, S. H. Kent.

Montreal, Que.—The Board of Control appointed a committee which includes Paul Galibert and Sir Charles Gordon, to take up with the Provincial Legislature the construction of a highway from Bout de l'Isle to St. Anne de Bellevue.

Ontario, Province of.—The importance of the completion at the earliest possible date of the provincial highway between Hamilton and Niagara Falls was urged on Hon. F. C. Biggs, minister of public works and highways, when he recently met representatives of various chambers of commerce in the Niagara district.

Oshawa, Ont.—East Whitby Township Council has set \$6,600 as the amount to be expended on roads and bridges in 1922, which does not include the construction of new bridges and concrete walks. Clerk, P. G. Purves, Columbus, Ont.

Ottawa, Ont.—The City Council granted \$86,000 to the Suburban Roads Commission for this year, \$11,000 for maintenance and \$75,000 for construction work.

Ottawa, Ont.—It is understood that between \$500,000 and \$700,000 will be spent this year on permanent roads in an area within ten miles of the Ottawa city post office.

Ottawa, Ont.—The City Council will apply to the Legislative Assembly for authority to construct an asphalt or asphalt and wood block pavement on Wellington St., between Garland St. and Parkdale Ave.

Ottawa, Ont.—The Board of Control recommended to the City Council that the sum of \$69,000 be granted to the Suburban Roads Commission as the city's share for construction work this year. The city has also been asked to provide \$11,000 for maintenance.

Peterborough, Ont.—The City Council will make an effort to secure from the Dominion Government an additional \$41,666 toward the cost of constructing the Hunter street overhead bridge. On the original cost of \$300,000 for the bridge the Government agreed to contribute one-sixth, or \$50,000, which was subsequently paid. Up to the present time the cost of constructing the bridge has been \$550,000, and the Council will make an effort to obtain one-sixth of this amount from the Government, or a total of \$91,666.

Quebec, Que.—Urging the importance of building a bridge on the Chicoutimi River to connect the northern part of the county of Chicoutimi with the rest of that section, a delegation headed by Mr. Gaudreault, M.L.A., waited on Hon. Antonin Galipeault, Minister of Public Works, and discussed the matter. The cost of the bridge would reach \$600,000. No final decision was reached.

St. Thomas, Ont.—A movement is under way to have work started this year on the proposed Memorial Driveway that was projected three years ago. City Engineer, W. C. Miller.

Sarnia, Ont.—Lambton County Council introduced a by-law to raise \$80,000 for expenditures on the county road system. Road Superintendent, John McCallum, Alvinston.

Stratford, Ont.—The construction of sidewalks on the following streets has been authorized for 1922: Mowat, Albert, Hamilton, Louise, King, Whitelock, Nelson, Gore, Britannia, Mornington, McLagan Drive, Hibernia St., McNab, Downie, St. Vincent, St. David, Birmingham, Douglas, Church and Water St. Also pavements on the following streets: Brunswick, Romeo, Albert, Douro, Church, West Gore, Erie, Water, McNab, Falstaff, Britannia, Cobourg and Hamilton. City Engineer, A. B. Manson.

Toronto, Ont.—The City Council deferred for two weeks final action on the Dundas St. extension to enable an appeal to be heard by the Ontario Railway and Municipal Board.

Toronto, Ont.—The City Council authorized the necessary steps being taken to get approval from the Dominion Government and Ontario Railway and Municipal Board for the plans of the new Gerrard St. bridge over the Don.

Toronto, Ont.—The Board of Control awarded contract for two sand dryers and one asphalt mixer to be placed at the city's asphalt plant, foot of Princess St., to Hetherington & Berner, at \$15,236. Four other tenders were received.

Toronto, Ont.—The Works Committee recommended the adoption of the report of Works Commissioner Harris for the construction of a concrete walk on Glenforest Road, south side, from Boscaille Ave. to Ronan Ave., at a cost of \$4,675.

Toronto, Ont.—The Works Committee recommended the grading of Marigold Ave. at a cost of \$5,276; grading of Larchmount Ave., from Eastern Ave. to Queen St., \$9,893; Berkshire Ave., \$11,168; and Rushbrook Ave., \$9,345.

Toronto, Ont.—At a recent meeting of ratepayers of Roden district, it was suggested that a joint meeting of the City Council, Parks Commissioner and ratepayers be arranged to discuss the building of a subway under the G.T.R. tracks at Ashdale Ave.

Toronto, Ont.—To extend Gerrard St. easterly in straight line from Logan ave. to Pape ave. would cost approximately \$312,000, reports Works Commissioner Harris. To so reconstruct the subway as to straighten Carlaw ave. between a point south and north of Gerrard street would cost approximately \$90,000.

Toronto, Ont.—Application will be made by the city to the Provincial Legislature for authority to pass a by-law to raise \$1,012,579.30 for the construction or renewal of certain pavements in connection with the construction, repair and renewal of the Street Railway tracks of the Toronto Transportation Commission.

Toronto, Ont.—The Works Committee recommended the adoption of the report of Works Commissioner Harris for the construction of pavements on the following streets: Berresford Ave., \$10,179; Boston Ave., \$10,438; Durie St., \$22,277; Evans Ave., \$46,788; Evelyn Ave., \$13,815; Parkview Gardens, \$12,673; Thome Crescent, \$8,065; Woodbine Ave., \$14,610; Hayden St., \$17,283; Lawlor Ave., \$28,367; and lane 1st north of Grenadier Road, \$4,961. Also for the construction of concrete sidewalks on the following streets: Evelyn Ave., Glembeom Ave., Glembeom Blvd., Ladysmith Ave., Milverton Blvd., Strathmore Blvd., Wolverleigh Blvd., Woodington Ave., Woodmount Ave., Berkshire Ave., Eastern Ave. Crescent, Larchmont Ave., Marigold Ave., and Rushbrook Ave., at a total estimated cost of \$63,637.

Victoria, B.C.—Road and trail construction and improvement work has been authorized by the City Council on Hamilton Road, Chester St., Arbutus St., Haultaoin St., Vimy St., and Acton St.

Victoria, B. C.—In order to accommodate the British firm of William Arrol & Co., the Public Works Committee recommended that the time for receiving tenders for the construction of the street railway portion of the Johnson St. bridge be extended from February 13 to February 27.

Welland, Ont.—The Standard Steel Construction Co., of this city, has secured contracts for the construction of three swing bridges, one for the Trent canal, at Hamlet, Ont., and the other two for locks 1 and 2 on the Welland canal at Port Dalhousie, Ont.

WATER, SEWAGE AND REFUSE

Amherstburg, Ont.—Tenders have been received for the construction of a sewer on Alma St. Town Clerk, W. A. McCormick.

Barton Twp., Ont.—The Township Council appointed a committee headed by Reeve Bird to obtain estimates on the cost of installing a water and sewerage system for the mountain district.

Bridgeburg, Ont.—The Town Council passed a by-law for the construction of a sewer to the Amigari section, at a cost of \$40,000. Plans are being prepared by Engineer Ross.

Etobicoke Twp., Ont.—The Township Council intends to pass a by-law to construct a system of water works at a cost of \$4,595. Clerk, Stephen Barratt, Islington, Ont.

Glencoe, Ont.—The Town Council plans the installation of a water works system to provide better fire protection. Clerk, Charles George.

Hamilton, Ont.—The installation of a water meter system has been recommended for the city by City Engineer E. R. Gray, the work of installation to be done gradually. Mr. Gray recommended that \$25,000 be set aside for this purpose.

Hesper, Ont.—The Town Council passed a by-law providing for the borrowing of \$18,000 for water works extensions. Clerk, M. E. Jardine.

Kitchener, Ont.—The Canadian Incinerator & Furnace Co., Ltd., of Toronto, have been awarded a contract to install an additional unit to the city's incinerator. This company erected the incinerator in 1914 and it has been in almost continuous operation since its installation.

Winnipeg, Man.—The City Council intends to construct sewers on Guelph St. and Union Ave., at a total estimated cost of \$3,368. City Clerk, C. J. Brown.

New Toronto, Ont.—A description of the site and the plans of the waterworks intake pipe line proposed to be laid in Lake Ontario at New Toronto have been deposited with the Minister of Public Works at Ottawa.

Ottawa, Ont.—The City Council approved of the laying of a 15-in. and 18-in. tile pipe sewer on Emett St., from Lewis to Lisgar St. Commissioner of Works, A. F. Macallum.

Ottawa, Ont.—The City Council will apply to the Legislative Assembly for authority to borrow \$160,000 for laying an additional line of water pipes in connection with the water supply system.

Peterborough, Ont.—The City Council will build a sewer on Roger St. City Engineer, R. H. Parsons.

Port Credit, Ont.—Reeve R. M. Parkinson announced that the town of Port Credit will have nothing to do with the purchase of water from New Toronto, as suggested by the Ontario Board of Health. He declared that it would be the policy of the council to go ahead with the construction of a separate system.

Stratford, Ont.—City Council authorized the construction of water mains on the following streets this year: St. David, Simcoe, Downie, and Linton. City Engineer, A. B. Manson.

Stratford, Ont.—The City Council authorized the construction of sewers on the following streets this year: McLagan Drive, Simcoe, Nelson, Romeo, Frederick, Dover, Downie, Front, Borden, Norfolk, East Gore, Laurier, Perth, Ross, Whitney, Brant, Guelph and Nile. City Engineer, A. B. Manson.

LIGHT, HEAT AND POWER

Brandon, Man.—The City Council passed a resolution that the Provincial Government be asked to enunciate their policy in the matter of the development of the provincial hydro-electric scheme with a view to the construction of a provincial trunk line to the western part of the province.

Calgary, Alta.—President and Managing Director H. B. Pearson of the local gas company, stated that the company is prepared to expend \$750,000 in drilling new wells next summer for procuring a new supply of gas.

Courtright, Ont.—The ratepayers passed the by-law authorizing the raising of \$11,000 for installing Hydro power. The line will run from Sarnia.

Gloucester Twp., Ont.—The Township Council is considering a project to enter into an arrangement with the Hydro-Electric Power Commission of Ontario for the installation of an electrical system throughout the township.

Halifax, N.S.—It is understood that the Nova Scotia Tramways and Power Co. will purchase from the Nova Scotia Power Commission, at cost, the electrical energy and power up to eighteen million kilowatt hours per year, produced by the hydro development at St. Margaret's Bay, near here. A 30-year contract to this effect has been signed, it is announced. The development has been practically completed by the Power Commission, together with transmission lines to Halifax.

Oakville, Ont.—Residents of the town have formed a company to be known as Oakville Electric, Ltd., with a capital of \$5,000, for the purpose of getting hydro-electric power in the town. President, H. C. Christie.

St. Thomas, Ont.—The gas committee of the City Council has decided to reduce its estimate for the installation of a vertical retort system by \$55,000, making the total amount required \$120,000 instead of \$175,000, as first estimated. The reduction was brought about by a decision to only install one unit this year instead of two.

Toronto, Ont.—The Property Committee approved of a policy of installing 200-watt. nitrogen lamps on a number of business thoroughfares.

Winnipeg, Man.—Joseph Rocchetti, provincial power commissioner, in his annual report urges the extension of power lines to Brandon, Elm Creek, Glenboro, Maniton, Gladstone, Plum Coulee, Morris and Miam.

Winnipeg, Man.—The contract for two 310 k.v.a., 230-

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

A Review of Hydro-Electric Progress in Canada

Progress in Development Last Year Very Satisfactory — 300,000 h. p. Installed in Dominion — Ontario Leads With 177,000 h.p., Quebec Follows With 90,000 h. p. — Queenston-Chippawa Largest Single Development

DURING the year 1921, the re-adjustment of values following war-time inflation, made substantial progress according to a review on Hydro-Electric progress in Canada, prepared by the Dominion Water Power Branch of the Department of the Interior, Ottawa. This readjustment necessarily brought in its train many business and financial difficulties and the lack of confidence in trading circles generally led to a reluctance of capital to embark upon new enterprises. Employment fell off with a corresponding diminution in popular purchasing power and in consequence there has been a general tendency to mark time while re-adjustment advances the further step which will bring costs within the reach of the normal spending power of the community both individual and corporate. The belief seems to be growing, however, that the madir of depression has been passed and that business conditions are improving slowly but surely, and that though 1921 was a bad year for industry it also saw the turning point safely negotiated.

The hydro-electric industry though naturally affected by the general depression suffered no set-back and in fact the horse power installed during 1921, 300,000 h.p., stamps it

That Canada is not lagging in water power development may be shown by comparison with the country most comparable in general conditions, i.e., the United States, thus:

Water Power Development Per Capita

	H. P. installed per 1,000 of population		
	1902	1912	1920
Canada	47	198	280
United States	26	51	93

The total increase in horse power installed from 1900 to 1900 was 153%.

A brief review of development work in the individual provinces and of progress in investigation and plans will give a clearer view of the general situation.

British Columbia

The new construction work in British Columbia in 1921 included that of the British Columbia Electric Railway Co., which commenced the installation of a fourth unit

CITY OF WINNIPEG MUNICIPAL PLANT—POINT DU BOIS, WINNIPEG RIVER. EXTENSION TO POWER HOUSE COMPLETED 1921 (LEFT HAND END)

as one of the most progressive years in Canadian water power history.

The progress of development is somewhat difficult to follow from year to year because the year is too short an interval. From three to five years or even longer often elapses between the first consideration of development and the delivery of power. Again most projects commence with an initial installation much less than the ultimate projected capacity and new units of machinery are installed from time to time as the load develops. In other words, what we may call the scoring column often does not reflect new construction for some years after such construction has been actively underway, but continues to record new scores from old developments.

The 300,000 h.p. installation during 1921 is made up of both kinds of growth and in addition a considerable amount of new construction was initiated which ensures that as old power plants reach their ultimate capacity new ones will take their place in maintaining the continued growth and prosperity of Canadian hydro-electric enterprise.

of 13,200 h.p. at the Stave Falls plant and the Nanaimo Electric Light & Power Co., which placed in operation a 200-h.p. unit in its Coal Creek plant.

Surveys and investigatory work have been carried on for a development on Bridge River, 130 miles from Vancouver, where an ultimate development of 360,000 h.p. is available. The British Columbia and Alberta Power Co., Ltd., has completed plans for the construction of a 6,000 h.p. plant on Bull river in 1922.

Alberta

In Alberta a development of 8,090 to 10,000 h.p. at Lake Minnewanka has been studied and surveyed to supplement the plants of the Calgary Power Co., as further power is urgently required in the city and district.

Manitoba

In Manitoba the City of Winnipeg municipal plant at Point du Bois on the Winnipeg river was increased during 1921 by two units totalling 13,800 h.p. and another unit of 6,900 h.p. is now being installed. This will bring the

total installation up to eleven units aggregating 67,100 h.p. A new duplicate transmission line to the city was also completed.

The developments at Du Bonnet falls (Great Falls) on the Winnipeg river, commenced in 1919 but delayed by

ST. MARGARET'S BAY, N.S. DEVELOPMENT FOR THE SUPPLY OF THE CITY OF HALIFAX AND DISTRICT.

financial conditions, is now financed and under active construction. The undertaking is taken over from the Winnipeg River Power Co. by the Manitoba Power Co., Ltd. The initial installation will be two units totalling 56,000 h.p. and the ultimate, six units totalling 168,000 h.p., at a cost of about \$10,000,000; the initial installation is expected to be completed in 1924.

The City of Winnipeg and District will then be well supplied with power from the three developments i.e., the city's plant, 67,100 h.p., Winnipeg Electric Railway Co.'s plant at Pinawa, 35,600 h.p. and the Du Bonnet plant 56,000 h.p., a total of 160,700 h.p.; in addition to which the developments at Point du Bois and Du Bonnet provide for the installation of further units totalling some 146,500 h.p. First class undeveloped sites on the Winnipeg river will provide for approximately a further 300,000 installed h.p., so that the total power available from this source is some 600,000 h.p.

The Manitoba Power Commission, a provincial organization on similar lines to the Hydro-Electric Power Commission of Ontario, has been active during the past year in extending its transmission system and has now a considerable network. The original line to Portage-la-Prairie, conveying energy purchased in bulk from the city of Winnipeg, has been duplicated and additional lines have been built to Morden, Carmen, Roland, Jordan, etc. Extensions of 150 miles are contemplated during 1922.

Ontario

Construction in the Province of Ontario during the past year has been very considerable. In the same period field investigations and activities leading to future construction have been extensive and there is good prospect of continue construction in the present year.

The Ontario Hydro-Electric Power Commission has continued its activities. Pre-eminent in its construction work of 1921 has been the Queenston-Chippawa project involving an initial installation of five 60,000-h.p. units and an ultimate installation of 600,000 h.p. As is well known this development when completed will be the largest single hydro-electric plant in the world, containing the highest powered units (60,000 h.p.) yet built and setting in several respects new high standards in hydraulic practice. During the month of December water was turned on in the power canal and the first unit placed in operation. The

second unit is ready for practically immediate operation. At the Cameron Falls development on the Nipigon river for the supply of power to Fort William and Port Arthur, this being the second largest generating plant of the Commission, construction of the control dam was completed, thereby permitting the initial installation of 25,000 h.p. operating under the full projected head. Provision has been made at the Cameron Falls plant for a total installation of 75,000 h.p. Work on the 10,000 h.p. development at Ranney's Falls on the Trent river near Campbellford was continued throughout the year.

Private interests have also been active in hydro power construction. The Twin Falls plant, of the Abitibi Power and Paper Co. with a capacity of 24,000 h.p. has been completed, while other new plants completed include the 5,200 h.p. development of the Spanish River Pulp and Paper Co. at Smoky Falls on the Sturgeon river and the 4,500 h.p. development of Canada Cottons, Ltd., at Cornwall. Extensions to existing plants completed during the year include 7,200 h.p. at the plant of the Great Lakes Power Co. at Sault Ste. Marie and 250 h.p. at the Lincoln Paper Mills plant at Merriton and an addition of 4,800 h.p. to the Kenora municipal plant is under construction.

The total turbine capacity installed in Ontario during 1921 amounted to 174,000 h.p. with provision made for extensive additions during the forthcoming year as market conditions demand.

Numerous water power projects are receiving consideration. These have in view additional power supply for the Porcupine mining district; the electrification of the T. & N. O. Railway, and various pulp and paper undertakings.

The proposals for the improvement of navigation and development of power on the St. Lawrence river have been far advanced during the past year. The Board of Engineers appointed by the International Joint Commission to examine the feasibility of the undertaking presented their report last July and this is understood to have been favorable from both the financial and engineering standpoints. In brief, this report suggested four schemes and recommended a combination plan by which the waterway improvement and initial power development of 1,464,000 h.p., in the international section would cost \$252,000,000 and estimated that the power development would pay for the entire project in a comparatively few years. The full potential power development is estimated at 4,100,000 h.p. which could be reached as the market for power developed. Alternative proposals have been submitted by the Hydro-Electric Power Commission of Ontario, by Hugh L. Cooper & Co., of New York, and by the New York and Ontario Power Co. The Commission in a final report dated December 19, 1921, approved of the feasibility and desirability of the general navigation and power scheme but recommended that the engineering details be first passed upon by a Joint Board of Engineers of the two Governments.

Quebec

The activities of the Hydraulic Service of the Department of Lands and Forests and of the Quebec Streams Commission acting for the provincial government, have proved a very real incentive to the increased utilization of the water power resources of the province. Most beneficial work has been done by the Streams Commission in the actual creation of storage reservoirs in several of the principal watersheds. This work has not only proved of great value to the companies developing power on the various rivers so regulated but has also added considerably to the provincial revenues in that the cost is ultimately met by the companies benefited.

Recent operations of the Commission have included the letting of the contract for a storage dam on the Savana river, a tributary of the Ste. Anne de Beaupre. This will provide additional water for the operation of the Laurentian Power Co.'s development at St. Fereol.

Considerable activity took place in water power installation during the year 1921 throughout Quebec province. At Cedars, the Cedars Rapids Manufacturing and

Power Co. had under way the addition of two new units of 10,800 h.p. each, bringing their total installation to 151,200 h.p. This company is also constructing a new transmission line of steel-cored aluminum cable, strung on steel poles, to Montreal, a distance of about 30 miles. At Shawinigan Falls, the Shawinigan Water and Power Co. were preparing to install a new unit in their number two power station of 42,000 h.p. At Grand Mere additional turbine equipment was installed by the Laurentide Power Co. to the extent of 42,000 h.p. The City of Sherbrooke has reconstructed its hydro-electric plant at Weedon on the St. Francis river by increasing the head four feet and adding a new 1,700 h.p. unit, bringing the total installation to 4,650 h.p. At Nicolet Falls on the Nicolet river the Lothbiniere Lumber Co. placed in operation a new installation of 1,680 h.p. The Dominion Textile Co. replaced their old turbines at Magog by a new installation of 3,000 h.p. At St. Raphael on the Riviere du Sud, La Corporation d'Energie De Montmagny placed in operation a new hydro-electric installation of 3,600 h.p. Price Bros. & Co., Ltd., completed their hydro-electric development at Chute aux Galets on the Shesaw river of 17,600 h.p., the power to be transmitted for use in their pulp and paper mills at Kenogami and Jonquiere.

The development work completed in the province of Quebec during 1921 totalled 90,000 installed h.p., with 42,000 h.p. in process of installation. A number of new water power developments were projected during the year

New Brunswick

In New Brunswick an active development policy is being carried on by the province through the New Brunswick Electric Power Commission. Construction has proceeded on the development on the Musquash river, with an installation of 11,000 h.p., for the supply of the cities of St. John and Moncton, and it is expected that power will be available for delivery in the spring of 1922. Contracts are now being negotiated for the annual supply of 15,000,000 k.w.h. to St. John and 5,000,000 k.w.h. to Moncton.

The Bathurst Lumber Co. has had under construction at Grand Falls on the Nepisiguit river a plant of 13,500 h.p. for the operation of their pulp and saw mills and the supply of all commercial needs of the district and the installation of 9,000 h.p. was completed during 1921. The New Brunswick Electric Power Commission have arranged for the purchase of a block of power from the plant and have completed a 33,000 volt transmission line 40 miles long connecting this development with Newcastle and other communities in that district.

The Commission have in view a further development on the Lepreau river to supplement the supply to the cities of St. John, Moncton and districts, and a development on the Tetagouche river for the supply of the North Shore district.

Nova Scotia

The Nova Scotia Power Commission, formed in 1919 under the "Power Commission Act" for the purpose of creating a complete electric power system for the province, has since pursued an enterprising development policy.

The first provincial development, that at St. Margaret's Bay, near Halifax, with an ultimate capacity of 15,000 h.p., is now ready to deliver some 6,600 h.p. (shortly to be increased to 18,000) to Halifax as soon as the contract under negotiation with the city is completed. The re-construction and enlargement of the 800 h.p. plant on Mushamush river for the supply of Mahone, Lunenburg, Riverport, etc., has been completed.

In addition to the above work of the Commission several industrial installations have been made by private concerns. The Yarmouth Light and Power Co. have practically completed the rebuilding of their plant destroyed by fire and an additional 150 h.p. unit is being installed at Messrs. Wright & Jodfrey's plant on the Caspereaue river.

Detailed investigations have been continued for a development with an ultimate capacity of 30,000 h.p. at Sheet Harbor to supply New Glasgow, Stellarton, Trenton, etc., and for two developments of 7,500 h.p. and 1,200 h.p. at

Bear River, to supply Digby and other towns and projected industries.

New Dominion Water Power Regulations

As the fruition of several years of study by the Dominion Water Power Branch of the water power laws and

MUSQUASH RIVER, N.B. DEVELOPMENT FOR SUPPLY OF CITIES OF ST. JOHN AND MONCTON.

regulations of all the principal water power countries of the world, a new set of Regulations for water powers of Western Canada under the jurisdiction of the Dominion Government was completed during the year, under clause 12 of the Dominion Water Power Act. These Regulations were approved by Order-in-Council and were published as a supplement to the Canadian Gazette of Nov. 12, 1921.

Investigation (St. Lawrence River)

Prominent in the investigatory work of the year there must be mentioned that with respect to the St. Lawrence river. That carried out by Messrs. Wooten & Bowden for the International Joint Commission has been mentioned but reference must also be made to the exhaustive work on this matter by the Hydro-Electric Power Commission of Ontario, which started in 1913 and reached its fruition in 1921 by the presentation to the International Joint Commission of three complete alternative schemes for utilizing the full power of the St. Lawrence river.

Co-operative Investigation

The basic investigatory work regarding water power resources carried on by the Dominion Water Power Branch under co-operative agreements with the provinces of Nova Scotia, New Brunswick, Prince Edward Island, Ontario and British Columbia has proceeded with most satisfactory results, and close co-operation and interchange of information has been maintained with the province of Quebec. This co-operation results in better organization and increased uniformity in methods of investigation and especially in the steady growth of the completeness and effectiveness of the Inventory of water power and allied resources throughout the Dominion that is maintained by the Dominion Water Power Branch at Ottawa for the benefit of all interested in water power development.

Stream Measurement

In addition to special investigations of water power resources it is of interest to note that there are now some 750 stream measurement stations regularly maintained on the principal streams from coast to coast, either by the Dominion Water Power Branch or by co-operation between that Branch and the respective provinces. These figures do not include those separately maintained by the province of Quebec.

In Quebec, the Quebec Streams Commission, which

gives its special attention to matters of storage and flood prevention, has continued its highly successful work in the creation of the St. Maurice, St. Francois and Ste. Anne de Beupre reservoirs by studies of the water power possibilities of the St. Maurice, Chamouchaune and Peribonka rivers and the following north shore tributaries of the St. Lawrence, Les Escoumains, Bersimis and Franquelin.

Mackenzie District

Some special investigations were also carried out in 1921 by the Dominion Water Power Branch on the Slave and Hay rivers, which are of interest as being in the neighborhood of the route to the new oil fields at Fort Norman. On the power reach of the Slave river, some 20 miles long between Fitzgerald and Fort Smith, the power capacity is estimated at some 300,000 h.p. and on the Hay river there are two attractive sites estimated at a total of 30,000 h.p., in both cases under ordinary minimum flow conditions.

Relation of Water Power to Coal Consumption

Evidence on the relation of water power to coal consumption was submitted by the Dominion Water Power Branch to the Special Committee of the House of Commons on the Future Fuel Supply of Canada, which sat during the Session of 1921.

It was shown that in Canada there is 194% more water power developed per capita than in the United States and that, in spite of our much colder average climate, the consumption of coal per capita in the United States is greater

In Manitoba the Manitoba Power Commission has extended its activities and the Manitoba Power Co. has under active construction an important development at Great Falls on the Winnipeg river with an ultimate capacity of 163,000 h.p.

The latest figures on the water power resources of the Dominion showing the available water power, the additional installations during the past year and the present total developed power are presented in the appended table.

It will be noted from the table that the developed water power in Canada now totals to 2,756,000 h.p. with considerable activity in the way of new extensions, new construction and projects.

The figures for available power are based upon rapids, falls and power sites of which definite or well established information is to hand. Many feasible power sites are scattered from coast to coast which have not yet been investigated and placed on record. The above figures may therefore be said to represent the minimum power possibilities of the Dominion. As illustrative of the conservative nature of these figures, attention might be called to the provinces of New Brunswick and Nova Scotia where detailed analyses have disclosed most advantageous reservoir facilities for regulating stream flow and where it is estimated that, after providing for the diversity factor between installed power and consumers demands, these two provinces possess within their respective borders, 200,000 and 300,000 commercial horse power.

Province	Turbine Installation in H.P.		Available 24 hr. power at 80% efficiency.		
	On Jan. 1, 1921	Installed during 1921	On Jan. 1, 1922	At Ordinary Minimum Flow	Dependable for six months H.P.

x Includes two units in the Queenston Plant.

DEVELOPED AND AVAILABLE WATER POWER IN CANADA

than in Canada by 159% in industries, 150% in electric power plants and by 50% in the general average for all uses. At the then price of coal this 50% lower consumption per capita in Canada represents an annual sum of \$146,500,000 that, but for this water power development, would have to be spent on importing coal. The water power now developed is 2,756,000 h.p. and the capital invested therein is about \$534,000,000 so that, from the national point of view, this annual saving represents a return of 27.5% on the investment that has secured it.

General Summary

The more important items of this review of hydro-electric progress in Canada in 1921 may be summarized.

There has been added to the installed capacity of water power plants practically 300,000 h.p. The new installation in the individual provinces has been approximately: Nova Scotia 13,000 h.p., New Brunswick 9,000 h.p., Quebec 90,000 h.p., Ontario 174,000 h.p. and Manitoba 14,000 h.p.

The Power Commissions of Nova Scotia and New Brunswick have successfully carried out the first provincial developments and are practically ready to deliver electrical energy to the principal cities.

In Ontario the Queenston-Chippawa plant of the Hydro-Electric Power Commission of Ontario has been placed in operation with two 60,000 h.p. units installed.

SUGGESTS TWO GROUPS OF RAILWAYS IN CANADA

A RADICAL suggestion for the solution of the Canadian railways problem is offered by William P. Kellett, president of Dominion Steel Products Co., Ltd., Brantford, Ont., and formerly consulting engineer for the Drayton-Ackworth Commission in fixing the value of the Canadian Northern System.

"In view of the critical nature of the railway situation in Canada," said Mr. Kellett, "I suggest that two large organizations be formed to take over present lines in Canada." One system would include the Canadian Pacific, the Intercolonial, and the various lines of the C.P.R. steamships. This system would also include that portion of the Transcontinental line from Winnipeg East. The other system would include the Canadian Northern, Grand Trunk, and the Grand Trunk Pacific from Winnipeg to Prince Rupert, also the Hudson's Bay Railway from Hudson's Bay Junction to Port Nelson.

This plan would divide the railways of Canada into two large competing systems, each of which would have practically equal opportunities in the development of the country, and each of which would share equally the burden of operation of those portions of the railways which have been built, and which are now not sufficiently productive to meet fixed charges and operating expenses.

SCOPE OF THE ENGINEER IN FOREST INDUSTRIES

Large Number of Engineers Employed in Pulp and Paper Industry — Scientific Methods Necessary to Ensure Success in Forest Industries

By S. L. de Carteret

Manager of Lands Department — Brown Corporation

IN choosing the above subject I had in mind the pulp and paper industry in particular, but my remarks will apply equally to that other great user of forest products, namely, the lumber industry. On the basis of value, the exports from Canada in 1921 for pulp, paper, lumber and other wood products stood second on the list, and, if I am not mistaken, the money value of these commodities exceeded \$200,000,000, and constituted approximately 25% of the total export trade.

Referring especially to pulp and paper, Canada has over 100 pulp and paper mills, having a total capacity of about 2,300,000 tons annually. These mills represent a capital investment of more than \$350,000,000 and they employ more than 32,000 persons, in addition to many more thousands engaged in operations in the woods. The province of Quebec has over 45 pulp and paper mills, representing a capital investment of more than \$175,000,000, and whose combined capacity is in the neighborhood of 4,000 tons per day, or over 1,200,000 tons per year, which is about 50% of Canada's entire pulp and paper production.

This, then, is the field. What is the engineer's relation to it? I have an encyclopedia which divides engineering into fourteen branches. Very probably you would not agree with this classification, but the fact remains that at one time or another the pulp and paper industry uses thirteen out of fourteen of the engineers on that list. This is equivalent to saying that the engineer occupies a very important place in the manufacture of pulp and paper; in fact there is probably no industry whose success is more dependent on the engineering profession. As far as the various processes are concerned, while a high state of efficiency has been attained in many directions, other processes must be found or improved for the economic utilization of certain kinds of wood at present considered unsuitable for pulp and paper, and therein is a wide field for the chemical expert.

Must Improve Transportation Methods

Probably the widest field for the engineer today is in improving methods of transporting the raw material from the forest to the mills as it is only in recent years that woodland operations have received due consideration and attention in this country. Formerly it was the general custom to tell the wood boss to cut so many logs in a certain region, and if he got the requisite number at a seemingly reasonable price, the logging operation was considered a success. No attention was paid to the fact that only the best of that timber adjacent to the streams was being cut; that more mature timber was left standing than the amount cut, most of which would eventually be blown down; that waste in high stumps and large tops was equivalent to a large percentage of the timber actually taken; and that the cost of cutting the timber left standing would be all out of proportion with the prices paid for other near timber.

Today the wood using industries realize that their forest capital merits as much care and attention as their other invested capital. Today engineers are employed to survey and map the timber lands in advance of the logging operations. Topographical plans are made which show definitely how best to log and bring out the timber.

Cutting operations are restricted to certain areas and controlled, so that all the merchantable timber which should be removed is taken, and frequent inspections are made to prevent waste from various causes. Storehouses are located where they will serve the greatest territory economically for the longest time, and are built along lines giving promise of minimum upkeep expense, and arranged to expedite taking in and sending out supplies with the least amount of handling. Surveys and plans are made for road

locations previous to construction so that the best possible grades can be obtained and minimum maintenance result.

Better Dams Built Now

Until a few years ago, dams for driving purposes were located and built in a haphazard manner. Such structures located on poor bottom were often washed out by the spring freshets. Frequently dams were built of such dimensions that it was impossible to fill them, while in other cases it was often impossible to discharge the water impounded at a sufficient rate to fulfill the requirements for which they were built, and in some instances dams were carried away because the gates were of insufficient size to carry off the flood waters.

The use of engineering principles now does away with these troubles. The engineer selects a firm foundation where possible, or takes adequate measures to prevent undermining and washouts. He obtains data on precipitation and run-off, measures and calculates the volume of the storage, and then locates and builds a dam of the necessary dimensions to impound the available water, or such portion as is required. He also provides gates of sufficient number and dimensions to discharge the requisite amount of water.

In driving logs and pulpwood the usefulness of the engineer does not end with the construction of driving dams. Other river improvements such as side piers, holding booms, jam piers, &c., claim his attention. There are instances where the supervision of driving by engineers has resulted in the work being accomplished with greater dispatch and at less cost than where ordinary methods of control have been followed. This is particularly true where positive stream regulation is possible, and where, in driving through falls and rapids, the amount of water necessary for an economic driving pitch has been previously ascertained and can be obtained by regulating the flow.

Regulation of Streams

Referring to stream regulation, which is so important in developing the large amount of power required by wood using industries, very few of the rivers in this province are under adequate control. Hence there is an enormous amount of work for the engineer in establishing and operating gauging stations, and in ascertaining the possible storage and regulation of rivers, which, if not at present, will in the future supply the power needed by other pulp and paper mills, and will necessitate the design and construction of permanent dams and regulating works of considerable magnitude.

Water is probably the most useful servant of the wood using industries, as it is the cheapest and most used means of transporting the raw material. However the water-courses designed by nature do not always suit our requirements. They may not run in the direction we desire or they may be too small or too rough to carry the necessary quantities of raw material.

Under such circumstances the engineer must ascertain the possibility of building flumes or sluices to deliver the product at the desired point, and therein he finds ample scope for his ingenuity in locating the best routes and in designing and erecting the most suitable structures to conform to the controlling conditions of the particular problem. The use of flumes often makes it possible to obtain timber which would otherwise be inaccessible. Frequently the use of a flume will increase the annual output of a region several times over that actually possible if the adjacent stream were used, the expense of such transportation, including the original cost of the flume being only a small fraction of the stream driving cost.

In other places a flume may be used to deliver the wood output of several streams to one central point, thereby eliminating separate wood preparing plants on each individual stream. Again flumes may be used to advantage in diverting wood from one watershed to another. This may necessitate pumping the water required, but since a comparatively small quantity of water will carry a large amount of wood in a properly designed flume, the idea is entirely practical. The use of water sluices to load wood

into boats and cars is also a common practice and as this precludes the use of machinery and power with the attendant wear and tear, considerable saving results in operating costs.

These then, are some of the problems which confront the engineer in forest industries. Some of them may not seem of great importance but solving them contributes materially to the success of the various enterprises.

Definition of Engineer

Referring again to my encyclopedia, one definition of an engineer is:

"One versed in or practising any branch of engineering."

Another definition is: "A person who manages skillfully or carries through, any enterprise, by contrivance and effort."

While the first definition is exact, from the professional viewpoint, is not the second worthy of a moment's consideration? Does it not indicate the desire of every engineer, to "manage skillfully" and to "carry through by contrivance and effort."

The successful engineer must, of necessity, be a pioneer, and as such must be determined and resourceful, adapting himself to every inconvenience, and able to find a ready solution to the varied difficulties which crop up in his work. In addition, he must have vision and large ideas, based on sound judgment.

As we look back on the inception and building of the Transcontinental Railway, I am sure that the ten years which many of the engineers spent on reconnaissance and later on construction, in carrying that forerunner of civilization through the wilderness, must be an immense source of satisfaction to them today, especially when they see with their own eyes the villages and industries which have sprung up along the road, and which were made possible by their determination and effort.

And no less must be the gratification of those who went fifty miles further into the wilderness and built the Conlin Dam, creating the second largest artificial reservoir in the world, which, through the additional power obtained, makes itself felt, not only in the plants along the banks of the St. Maurice River, but in the cities of Montreal, Quebec and Sherbrooke.

Similarly in the future, the expansion of forest industries will demand the same pioneering effort on the part of the engineer. Vast areas of forest land, at present inaccessible will have to be brought into close communication with business centers. Railways will have to be built, towns laid out, harbor works constructed, channels dredged, and vessels more suitable for carrying certain forest products, designed and fabricated.

In places where, today, the forest stands untouched, tomorrow the engineer must exercise his skill in planning for the economic utilization of nature's wealth. In doing this he may have to clear a place large enough to pitch his tent; he may be isolated from his kind for many months; but if he "manages skillfully" and "carries through," he will eventually see a silent forest transformed into a scene of keen activity.

His camping place will become a memory only, giving place to monuments of industry where hundreds of souls will make their homes and take their place in the world's work. He will see the rivers performing useful service in transporting raw materials, and in supplying power, light and heat. In short he will see the goods in nature's storehouse co-ordinated and transformed to meet the needs of humanity.

Is this not scope enough for the engineer? Does it not give him ample opportunity to make a permanent record of his labors, and should he not derive great satisfaction in so doing? — Paper read before the Quebec Branch of the Engineering Institute of Canada, Feb. 13, 1922.

The Hamilton Town Planning Board has elected the following officers: Chairman, J. J. Mackay; vice-chairman, John Connon; secretary, Thos. S. Morris.

CAPITAL COST OF EQUIPMENT SHOULD REPRESENT ACTUAL COST

SPEAKING recently before the Electrical Engineering Technical Club in London, Ont., J. E. Pile, of the hydro-electric staff, said. It frequently happens that the equipment originally installed in a station or transmission line has to be removed, either on account of obsolescence or of insufficient capacity. In such case the original amount paid for the equipment, plus cost of engineering, labor and other expenses incidental to the first installation is removed from the capital cost. For instance, if a transformer is removed from a station, all capital invested in that station in respect to the transformer is taken out, thus for the time being, the amount remaining in our records represents the cost of the building and any other equipment that it was not necessary to remove. The value of the replacing equipment can then go back into the station's cost, and our books will reveal the actual amount paid for the building and apparatus as it stands after the change has been made."

The same method is adopted in respect to transmission lines. Expenses of this nature are considered a contingency and are charged against our contingency account. Thus in the balance sheet for 1920 the assets of all the municipalities associated with the hydro-electric system contain the item Total plant, \$27,009,316.65. That sum is actual outlay and has no relation to replacement values of either the buildings or the equipment. The principle adopted by the Hydro-Electric Power Commission of Ontario is that the capital cost as shown in the commission's books must at all times represent the actual cost of the equipment in operation.

LECTURES ON WATER POWER DEVELOPMENT AT UNIVERSITY

A SYMPOSIUM on Water Power Development will be held at the University of Toronto on February 27 to March 6. The course has been arranged by the hydraulic section of the Department of Mechanical Engineering, Toronto University. Lectures will be delivered by Lewis F. Moody of the I. P. Morris Co., T. H. Hogg, and Max V. Sauer of the Hydro-Electric Power Commission of Ontario, Norman R. Gibson of Niagara Falls and Wm. White of the Allis-Chalmers Co. All enquiries regarding the course of lectures should be addressed to Prof. R. W. Angus, University of Toronto.

Pipe-line companies deduct 3 per cent. from the oil gaged to allow for impurities and loss. The fairness of this figure has been questioned, and in order to arrive at a fair basis of deduction upon which to compute the royalties due the Government from operators on public lands, samples of oil from points scattered throughout the Salt Creek field in Wyoming, have been collected by United States Bureau of Mines engineers, and submitted for analysis. Although the results indicated that the deduction of 3 per cent. was large, it has been decided that in fairness to all concerned similar tests of samples should be collected at other seasons of the year and final conclusions be drawn from all the data. The results of this work will be published later.

A record attendance featured the luncheon in the Palm Room of the Chateau Laurier held under the auspices of the Ottawa Branch of the Engineering Institute of Canada, at which the chief speaker was Paymaster Commander W. H. Eves, R.N., who dealt in a graphic manner with the famous battle of Jutland. Commander Eves went through the battle in H.M.S. Royal Oak, and in his capacity as officer in charge of her coding office, he was in intimate touch with the development and progress of the battle. His address was listened to with close attention by the large company present, and was admirably illustrated by large charts showing the various dispositions of the rival fleets. The speaker was accorded an ovation at the close.

BITUMINOUS FOUNDATIONS FOR STREET AND ROAD PAVEMENTS

Rigid and Flexible Types of Pavement Discussed at Length — Cites Cases Where "Black Base" Has Been Used — Advantages of Bituminous Concrete

By Hugh W. Skidmore C.E.

Of the Chicago Paving Laboratory, Inc., Chicago, Ill.

THE TWO most important elements affecting the design of pavements for both city streets and county roads are the character and the intensity of the traffic to be carried. These two factors combine to determine the probable destructiveness of the most potent of all traffic forces, viz: impact. There are other important considerations, such as bearing power of soil, temperature variations, drainage, quality and quantity of local materials, etc., but all of these are of secondary consideration when compared with traffic. The remarkable changes in kind, weight and speed of vehicles which have occurred in the last few years, have necessitated departures not only from some of the accepted practice formulae pertaining to various pavement types, but also from some of the previously conceded standard types of foundation and wearing surface construction.

No One Type Adequately Meets all Conditions

It is ridiculous to assume that any one type of foundation or wearing surface will prove the best under all conditions. In fact, it is very often the case that more than one basic design should be used within a given length of pavement and until this fact is more generally recognized, failures will continue to be more prevalent than they should by reason of the known limitations attending any given basic design.

Two schools of thought, as applied to pavement foundations, have been evolved. These are essentially different in their fundamental principles. One of them seeks to overcome the destructive effect of the traffic loading, which at any instant may be converted into impact of variable intensity and often equivalent to several times the dead load by means of a rigid slab possessing strength superior to the possible force of impact; the other dissipating the blow by absorbing a very considerable portion thereof through a flexible structure, which is always in actual contact with the subgrade, thereby insuring greater uniformity of load distribution and functioning as a distributing medium or foundation and not as a deflector.

Rigid Types of Pavement Discussed

Rigid types, since they must possess strength superior to the traffic forces, have undergone in rapid succession modifications which, with few exceptions, have been of such nature as to increase the original cost of the pavement very substantially. Perhaps the most important reason underlying the necessity of these modifications is the fact that the rigid slab is not at all times in actual contact with the subgrade and, therefore, does not always function as a distributing medium, but must sustain the entire force of the loading within itself. The fact that concrete pavements warp due to temperature stresses, which has been demonstrated by certain investigations of the Illinois State Highway Department, indicates that at almost any time the rigid slab can be expected to be functioning either as an arch with bearing at the outside edges of the slab and free from the subgrade in the central portion, or functioning as a simple cantilever beam, with the fulcrum at or near the crown and with the outside edges not in contact with the subgrade; therefore, the maximum strength of the rigid pavement slab will be demanded when it is acting as a cantilever beam. In view of the data thus far obtained, it is only logical that this idea has been introduced into the design of rigid pavements. It is well known that the internal stresses in pavements, created by changes in temperature, often become very powerful forces and to date the rigid type of construction has failed to offer uniformly satisfactory resistance, as evidenced by cracking.

While it is true that the seriousness of such failures is often reduced by more careful attention to drainage, preparation of subgrade, etc., they are, nevertheless, admittedly inherent weaknesses in this particular type. Soil conditions in certain sections of the country may be such that during a portion of the year the bearing power of the soil will be so low that it cannot be relied upon as offering any very substantial support to the pavement structure. The unstable soil condition may be of limited extent and the soil may be of such character as to admit of ready drainage so that proper attention to this feature will remove the difficulty. Again, unstable soil during a considerable portion of the year may prevail more or less generally throughout certain localities, or the soil may be of such nature that it is practically impossible to adequately drain it even with very elaborate structures. In such cases the construction of sub-foundations may prove a practical solution, while at other times it will be found that a rigid pavement structure will be the most economical. Likewise a combination of subgrade drainage and the construction of artificial subgrade or sub-foundation overlaid by either a rigid or a flexible type of structure will often prove to be the most adequate solution.

It is quite natural that Portland cement concrete and monolithic brick and block pavements, which exemplify rigid construction types, should be passing through the experimental stage in order that they can be studied with respect to their probable ultimate efficiency. Ultimate efficiency, or economy, is of supreme importance and must include not only the original cost, but to this must be added the cost of maintenance and the total spread over a term of years representing the average natural life of the pavement.

Only quite recently have we come into possession of any very definite understanding of some of the forces to which pavements are subjected and as to what limitations appertain to various types with respect to their resistance to such forces. There remains a vast amount of information still to be acquired and investigations which are now in progress will undoubtedly indicate new channels for further study. Some of these investigations now under way deal exclusively with either the rigid or flexible type, while others include both. It has recently been my privilege to observe the work of this nature which is being conducted by the Illinois State Highway Department and to note the very commendable thoroughness with which they are attacking many of the problems surrounding several designs of modern highway construction. There is no doubt but that a fund of very valuable data will result from such impartial, scientific investigations, some of which will apply to all types of pavement construction while some will apply only to such types as are actually under investigation. It is hoped that as results are published from time to time, and the possibilities of further investigation concerning either flexible or rigid types are indicated, that such studies will be immediately undertaken and that this practice will continue until all of the fundamentals underlying both the rigid and flexible types shall have been determined, and it will then be possible to design pavements with a thorough understanding of the limitations and the adaptability attending the use of both.

Flexible Types of Pavements Discussed

Flexible and semi-flexible pavement structures are the oldest types known, and we have only to picture the old Roman roads to realize that the soundness of such construction was thoroughly demonstrated long ago. Although modern traffic requires a wearing surface of superior quality, it is debatable whether highways as they are so often built in this country today, will ever prove as truly economical as they would if we employed more generally the old idea of built-up roadbed, and then laid upon it our modern traffic floor.

Flexible foundations include gravel, broken stone, waterbound macadam, bituminous macadam, and hot-mix bituminous concrete. They are usually classified as to value

in a pavement structure in reverse of the order named, with bituminous concrete as the highest type. It is estimated that there are 15,000,000 square yards of "Black Base" giving satisfactory service in this country.

The bituminous foundation structure although possessing considerable beam strength, functions primarily as a shock reducer, that is, it gives slightly under the blow of impact in transmitting the load to the subgrade. Therefore, the design of this type places considerable reliance in the load supporting power of the subgrade. Its use, then, is dependent upon a knowledge of the ability of the subgrade to support loads equal to the probable force of impact reduced by the slab strength residing in the bituminous structure, whereas the rigid type, regardless of the bearing power of the soil, must be built to sustain the entire force of impact. For this reason a much thicker rigid foundation is required under given traffic and subgrade conditions, as has been demonstrated by impact tests.

It will be readily seen that even where soils are of questionable value as a subgrade, bituminous foundations may still be employed economically if an artificial subgrade of broken stone, gravel, boulders, or even cheaper materials, is first constructed. Where old macadam or gravel roads already exist, an excellent artificial subgrade is offered at almost negligible cost. If widening is necessary, this can usually be accomplished as in the case of the Kingston Pike at Knoxville, Tenn., where "black base" was laid about four inches thick over the old macadam and seven inches thick at the edges of the widened pavement. If time permitted, almost innumerable examples might be cited where "black base" has proven highly economical.

In the West, where the most extensive yardage of bituminous foundation has been laid, the general practice seems to be in taking alternate bids to specify five inches total depth for "black base" pavement and seven inches for Portland cement concrete pavement of 1-2-3 mix. And the general opinion appears to be that the "black base" pavements are giving superior service. Almost universally bids for "black base" pavements have been less than for either Portland cement concrete pavement or asphalt wearing surface on Portland cement concrete base. The saving has varied from 20 to 60 cents per square yard.

Contractors' Views

The opinions of contractors are always necessary and valuable since the very nature of their business requires that they give very careful thought to cost and practical construction features. With this idea in mind I have taken advantage of every opportunity to discuss with them construction problems and costs. In order to obtain an even more representative idea of their experience and views regarding bituminous base, questionnaires were sent to well known concerns throughout the country. Both the number of replies and valuable data contained in them greatly exceeded expectations. The combined activities of the contractors who replied cover every state in the Union as well as parts of Canada and, therefore, can be safely considered as representing the general attitude.

Briefly, the experience of contractors is such that they are willing to guarantee "black base" as readily as Portland cement concrete, and with few exceptions, stated that less risk was attached to "black base." The experience of contractors generally has been decidedly lower maintenance expense and lower first cost except in a very few instances where freight rates proved to be an extraordinary item. Assuming equal depth of foundation, the use of same aggregate materials in both types, and Portland cement concrete not to exceed 1-2-5 in richness of mixture, 90% estimated a difference in initial cost of from nothing to 50 cents per square yard less for "black base," and 75% estimated "black base" at from 25 to 50 cents per square yard less than Portland cement concrete. Since it is true that under similar traffic and subgrade conditions, less depth of "black base" is required, it will be readily seen that rigid foundations will usually cost substantially more than the highest type of flexible base.

One contractor said that during the past 14 years, 85% of the pavements he has laid have been upon flexible foundations, including broken stone, macadam and a goodly yardage of "black base." Certainly this contractor's experience with this type of foundation has proven highly satisfactory.

The only objection raised to "black base" construction by any of the contractors was the possibility of idle equipment in the event a protracted rainy season was encountered on work where the subgrade did not drain readily. Undoubtedly such a combination of circumstances would delay almost any kind of paving construction. However, it is quite probable that it would prove more serious with bituminous work than in the case of rigid base. If it is known that such local conditions as these are at all probable, it would seem that the engineer should provide for such a contingency by specifying an alternative.

The closing paragraph of the Southern contractor's reply seems to typify the attitude indicated by all of them. "Our opinion is that engineers will be performing a useful service in securing the adoption of specifications for black base as an alternate to the use of concrete base."

Conclusion

In summing up the advantages of bituminous concrete foundation it is thought that some of those referred to in previous discussions will bear repetition:

1. Because of greater resistance to impact, permits the use of a thinner base course than is required of the rigid types.
2. Provides uniform contact with the subgrade, thus insuring greater uniformity of load distribution, and precluding the necessity of relying upon the pavement structure to sustain the entire force of the traffic loading.
3. Provides homogeneity of mass and positive bond between wearing course and foundation when bituminous top course is employed.
4. Provides freedom from cracks, upheavals and ruptures which are common to rigid types.
5. Insures against the presence of moisture in the foundation structure, thus prolonging the life of the pavement.
6. Does away with the long period of time required for the curing of Portland cement concrete, thus permitting the opening of completed work to traffic immediately and providing a greater rapidity of turnover to the contractor.
7. Permits the use of the same aggregate materials as are ordinarily employed in Portland cement concrete foundations and provides decided construction economies.
8. Under given conditions, costs substantially less than rigid construction.
9. Maintenance expense is less than for rigid pavements.
10. May be easily repaired at minimum cost, the surface patch method being applicable except in the case of very serious defects.—Paper read before Good Roads Congress of the American Road Builders' Association, at Chicago, January 17, 1922.

As an indication of the contemplated activity in electric light and power plant construction, Dwight P. Robinson & Co., engineers and contractors, of New York and Montreal, have secured important contracts from the Duquesne Light Co. of Pittsburgh and the New Orleans Railway and Light Co. The work for the Duquesne Light Co. includes the installation of the second unit of 60,000 k.w. at the Colfax Power Station, together with three additional substations along the company's lines in the Pittsburgh district. The New Orleans Railway and Light Co. is proceeding with extensive additions to its power plant and distributing systems, including the installation of a 20,000 k.w. turbine and auxiliaries. Dwight P. Robinson & Co. is engaged in preliminary engineering work on several large developments, and reports impending construction activity among public utilities generally.

RAILWAY DEVELOPMENT DURING THE PAST YEAR

Grand Trunk Arbitration and Report of Operation of Canadian National Railways Were Outstanding Events — Lord Shaugnessy's Plan for Operating Systems

PERHAPS the most significant element in the railway situation during the year 1921, according to W. T. Jackman, in "The Monetary Times Annual" for 1922, was the work of the Board of Arbitration to which was entrusted the duty of ascertaining the value of the three preference stocks and the common stock of the Grand Trunk Ry. Co., preparatory to the complete absorption of that railway property in the government system. The appointment of the board was in pursuance of an agreement, dated March 8, 1920, between the Dominion Government and the Grand Trunk Railway Company for the taking over by the Government of the Grand Trunk Railway System through stock ownership.

This agreement provided for the acquisition of the "entire capital stock of the Grand Trunk, except the four per cent. guaranteed stock" amounting to \$12,500,000. In consideration for obtaining control of the Grand Trunk Railway Company of Canada and all its subsidiaries, included in what is called the Grand Trunk Railway System, the Government agreed to guarantee the interest on the existing debenture stocks in accordance with their terms, as follows:

5% Grand Trunk debenture stock	£ 4,270,375
5% Great Western debenture stock	2,723,080
4% Grand Trunk debenture stock	24,624,455
4% Northern debenture stock	308,215
Total	£31,926,125

In addition, the Government agreed to issue new stock of the Grand Trunk Railway Company of the par value of \$12,500,000, with a guarantee by the Government at four per cent. annual dividend thereon, in exchange for the then outstanding issue of four per cent. stock of the same par value, guaranteed by the Grand Trunk Railway Company, which was non-cumulative but prior in its claim on earnings to the preferred and common stock. The voting powers possessed by the debenture and guaranteed stocks were to cease, and all voting powers were to vest in the preference and common stocks.

The agreement provided also that the first preference (5%) stock amounting in par value to £3,420,000, the second preference (5%) stock amounting to £2,530,000, the third preference (4%) stock amounting in par value to £23,955,437, should be taken over by the Government at a £7,168,055, and the common stock amounting in par value to valuation to be determined by a board of arbitration, and in exchange for these stocks the Government should issue "new guaranteed stock," bearing four per cent interest, equal in amount to the arbitration value of the preference and common stocks.

Grand Trunk Arbitration

For determining the value of these stocks, therefore, there was constituted the board of arbitration, with Sir Thomas White representing the Government, Chief Justice Taft of the United States Supreme Court representing the railway company, and Sir Walter Cassels, Judge of the Exchequer Court of Canada, as the chairman. In the autumn of 1920 the arbitrators were taken over the main lines of the Grand Trunk and Grand Trunk Pacific and on February 1, 1921, they began the taking of evidence. The board was to fix the value of these stocks as of May, 1920, and its report was expected to be ready by April 9, 1921, nine months after its appointment. The proceedings before the board dragged on slowly, in spite of the intimation to the company that the time for the arbitration would not be extended except upon terms of immediate possession and control of the railway system of the Government.

It was considered by the Government that certain shareholders and others in England were showing their resentment at the taking of the property from them and

were endeavoring to give the impression that the Government was dealing harshly with the company. The Grand Trunk directors denied any attempt to block or impede the Government's work. The Government, on the contrary, declared that since public funds were being used to finance the railway operation it was unreasonable for the company to retain possession of the property. However, a Bill was later introduced into Parliament providing that, upon condition that the company should agree by May 16, 1921, to hand over complete control of the property to the Government, the arbitration would be revived. This was made effective; the arbitration was continued, and on September 7, 1921, the reports of the arbitrators were submitted to the Government.

The Board's Award

The chairman of the board and the Government representative on the board agreed in the award that "there is no value in any of the four classes of stocks." The important facts leading to this decision may be briefly outlined:

1. The manipulation of the accounts of the company, which rendered the books unreliable. This was done at the instigation of the chairman of the directorate in London, who preferred to pay dividends, even though they were not earned, rather than face an awkward situation by telling the stockholders the truth.

2. The draining of the company's earnings to pay dividends rather than using these earnings to provide for the maintenance of the property and facilities in the most efficient operating condition.

3. The admission of the President of the railway company to the Railway Inquiry Commission of 1916, that, if left to itself, the Grand Trunk must suffer a crash, and both it and the Grand Trunk Pacific would have to go into insolvency if the present Grand Trunk had to carry out its obligation in regard to the Grand Trunk Pacific.

4. The enormous amount owing to the Government by the Grand Trunk on behalf of the Grand Trunk Pacific for capital for construction, for the payment of fixed charges and operating expenses, and for the expenses of the receivership.

5. That the value of the stock should be determined on the basis of the net earnings, actual or potential, of the company; and since the Grand Trunk System, as a system or group of interrelated and interdependent companies, has no net earnings (but rather a deficit) and is not likely to have a surplus of earnings for many years, the stock cannot have any investment value.

Minority Dissented

The company's representative on the arbitration board, Chief Justice Taft, dissented from the majority for the following reasons:

1. From the evidence of eminent railway engineers and managers, there seems no reason to doubt that the roadway and the equipment is in good condition for operation and this is proved by its success in handling a heavy volume of traffic, and in carrying the immense business thrust upon it during the war without a break. (He regarded the testimony of the men whom the Department of Railways and Canals had sent out to report upon the road and its deficiencies as an "enthusiasm of condemnation" that injured the weight of their evidence.)

2. The other two arbitrators refused to allow the admission of any evidence regarding the reproduction cost of the railway or the value of the physical assets. But Chief Justice Taft considered it perfectly relevant to the problem in hand to receive evidence both as to the reproduction value of the railway system and as to the physical value of the property as distinguished from the reproduction value. Such evidence is held in the United States as appropriate in judging what a railway company should earn and thereon in fixing rates. With conditions so much the same in two countries, and especially since the Grand Trunk railways are affected directly by the rates in the United States, it would seem proper to adopt the same rule of evidence.

3. In the arbitration of the value of the Canadian

Northern stock, in a similar proceeding in 1917, presided over by the Chief Justice of Ontario, evidence was received as to the reproduction value and this was used in making the award. If that evidence was relevant in the Canadian Northern case is it not also relevant in the Grand Trunk case? If such evidence had been admitted in this instance, it might have affected very materially the opinion of the board regarding the earning capacity of the road and its future possibilities, especially in view of the fact that in the United States the tendency is to make the reproduction value of railroad property used economically for transportation a proper basis for fixing rates.

4. Because the earning capacity of the company in May, 1920, was low — when the nadir of railroad prosperity in the world had been reached — or because the company was almost in a state of bankruptcy, is no reason for saying that the interests of its shareholders was worth nothing. Who can say what would have happened to the Grand Trunk if the Government had not taken it over? Perhaps the bondholders, who come to its rescue in 1860, might have come to its aid again and tided it over till the return of normal conditions.

5. On the basis of the past earnings and probable future earnings (concerning which statistics are given), there is every reason to believe that within five years the conditions of the company would be so much improved that it would have some leeway for making capital expenditure to improve the property without excluding the shareholders from participating in the benefit of better times.

Appeal to Privy Council

So far as the award is concerned the majority ruling is accepted, but it is of little consequence. The Grand Trunk has appealed its case to the Privy Council in England, and that tribunal has always been much more favorably disposed to guard the interests of property. If it should admit evidence concerning the replacement value of the Grand Trunk System — and from its past decisions there seems to be good reason for anticipating that it will — it is almost indubitable that the railway shareholders' claims will be adjudged fairly large, probably larger than the maximum amount which the Senate fixed as compensation for these four stocks, namely, \$64,166,666.66.

To one who looks with impartiality upon the results of the arbitration in the cases of the Canadian Northern and the Grand Trunk stocks there is something avowedly antagonistic to any sense of justice. In the former, the stockholders of the \$60,000,000 of common stock had never put a dollar into the property and yet this stock, which had been shown by the Railway Inquiry Commission of 1916-17 to represent "no cash investment," and to have "no present value," either on the basis of reproduction cost or earning power, was awarded a value of \$10,800,000 by the board of arbitrators; whereas the stocks of the Grand Trunk which are the subject of this arbitration, amounting to over \$37,000,000, or roughly \$180,000,000, all of which was "fully paid up in cash," were declared by the majority of this board of arbitration to be valueless.

Is the Award Unfair,

It is possible that in the case of the Canadian Northern there were interests which the Government did not want to see exposed to loss on account of unsatisfactory financing, while in the case of the Grand Trunk there were no friends at court to safeguard the interests of those who had invested their money in the enterprise? I merely suggest this question, and there are those who know well the answer. Moreover, is there any justice in admitting as evidence in the case of the Canadian Northern the reproduction value of the property, and using this in arriving at a decision concerning the value of the stock, whereas in the similar case of the Grand Trunk stock such evidence is refused by another board of arbitrators? Again we ask, Was there a method in this madness. If the boasted advantages of arbitration as a means of settling justly such a very important problem as the value of a great railway system can be upheld by such discriminatory application of the principle

as that manifested in these two cases, it is not a principle which can command the confidence of judicious and fair-minded people.

The National Railways

The second important feature in the railway interests of Canada during the year just closed was the annual report made by the Minister of Railways and Canals to Parliament in March, 1921. The deficit of the government railways, which in 1919 amounted to almost \$50,000,000, was shown to have increased in 1920 to about \$70,000,000. These figures do not include interest on the capital of the National Transcontinental and the Intercolonial railways; but as the capital for these lines was furnished by the government of the country, and interest on this capital, under a strict accounting, would be paid by one branch of the government to another, we may neglect this portion of the deficit.

An increase in the railway deficit of almost 50% within one year calls for explanation and is the occasion for a serious consideration of railway affairs. The announcement of such a result by the Minister of Railways and Canals created a sensation in Parliament and throughout the country, which has brought the railway problem into the forefront of national issues. The demand on the part of the Parliament and the public for a thorough investigation of the affairs of the government railways so as to make public the essential information by which to judge as to the administration of these railways, was met by the appointment of a committee of inquiry of the House of Commons on Canadian National Railways and Shipping.

Committee of Parliament

This committee, composed of members of the three parties in the House, were strictly limited in its functions. Its first and most important duty being to determine what information concerning these governmental agencies could be given with propriety to the public. Information was obtained by the committee as to the increased cost of operation, attendant upon the very high wages and high cost of materials, the method of letting contracts, the system of auditing, etc. The committee recommended that it should be reappointed early in the next session of Parliament to complete its inquiry, but until it should be able to give more careful consideration to the railway issues and to obtain further knowledge it did "not feel disposed" — to make definite reply" to the questions referred to it. Neither this committee nor the Government had any definite plan for dealing with the railway problem; the Government simply allowed the matter to drift on and passed an appropriation of \$165,000,000 for the year 1921.

But there are others who have been thinking about the remedies for the serious condition of the publicly-owned railways and two of these are men who stand high in the railway and industrial world. Because of the wide attention which has been attracted by their public statements, it is important that the letter should be considered here.

Lord Shaughnessy's Advice

Lord Shaughnessy, chairman of the Canadian Pacific directorate, sent to Premier Meighen a letter, dated April 6, but not made public until April 24, in which he reviewed the history and present conditions of the railways, and set forth his plan for relieving the people "from some part of the distressing and dangerous financial results now in evidence and which threaten the future." Briefly, his policy was to leave the Grand Trunk System under private ownership and operation and to bring promptly and effectively to the aid of the National Railway System additional financial strength and sustenance by having the national railways merged with the Canadian Pacific for operation and management.

He would have all the extraneous assets of the Canadian Pacific (including its ownership of railways in the United States, its ocean steamships, its land still owned, etc.) segregated from the company's Canadian system of railways, vessels, and other accessories and this latter would be joined with the national railways under the comprehensive organization of the Canadian Pacific for administra-

tion and operation. In consideration for the Canadian Pacific shareholders giving up their interest in the return from the extraneous assets, which would then be under separate management, the Government would enter into a contract approaching perpetuity with the Canadian Pacific by which the company would operate the whole property for account of the Canadian people. The Government would agree to pay the shareholders in perpetuity a fixed annual dividend on the share capital, to be supplemented by a further payment when the whole property was yielding a specified return.

By having these properties all operated by the one management, there would be so many economies effected that the operating ratio would be reduced from about 101% to a maximum of 80%, which would reduce the total annual deficit to eleven or twelve million dollars. Gradually even this would be overcome through settlement of the country and increase in traffic; and in the meantime the saving to the country would be very large. There is no question whatever that the plan outlined by this great railway statesman would be of inestimable benefit, in overcoming the financial handicap of the national railways and providing the country with transportation facilities in the management of which there would be shown enterprise, initiative and a constructive national outlook. If this plan were accepted the details would have to be worked out carefully; but thus far the Government has shown no inclination to depart from its present policy of drifting and piling up of deficits. The report of the Railway Inquiry Commission had shown some of the advantages from consolidation of railways, and this plan developed by the former President of the Canadian Pacific was simply carrying out the principle of consolidation to its logical conclusion, under the most hopeful conditions for imminent success.

It is worth noting here that the scheme devised and put into operation in England for readjusting the railway relations since the period of government control has been abandoned involves the creation of four large systems, each with a complete monopoly in its own territory. Evidently, then, monopoly does not have the same terror for the English people as it has for some craven-hearted parliamentarians and newspaper editors in this country, who are vociferous in their denunciations of a railway monopoly and equally clamorous in proclaiming the supposed virtues of public ownership.

Sir Joseph Flavelle's Recommendations

The other public man whose contribution upon the railway problem has been sent to the Government is Sir Joseph Flavelle, who during recent months has been the temporary chairman of the Committee of Management of the National Railways. After reviewing some aspects of the railway history he showed the financial necessities of the National System, involving capital expenditures in the immediate future amounting from \$125,000,000 to \$175,000,000, which will constitute a new fixed charge of \$10,000,000 per annum in addition to the present fixed charges. (This is in great contrast to the entire fixed charges of the Canadian Pacific Railway which stand at \$15,910,516.) Moreover, the operating loss for the year 1921, estimated by that of the first six months of the year, will exceed the governmental estimate. He emphasized the urgency of keeping politics out of the management, the necessity of the people using their own road, the importance of a well developed settlement policy for the unoccupied lands of the West, as well as for those lands contiguous to the railways; and while acknowledging that economies would result from the complete integration of all the components of the National System, he was careful to warn against the belief that these economies would be immediately reflected in reduced operating charges.

His calculations showed that the Government System, when fully completed by the inclusion of the Grand Trunk lines, would have net fixed charges aggregating \$66,000,000 per year. His plan for meeting the situation so as to relieve the railway company — "the Dominion Treasury cannot be

relieved except through increased earnings" — is as follows:

That the new National Railway Company should have a nominal authorized capital stock of \$750,000,000, consisting of \$500,000,000 of common stock and \$250,000,000 of preference (6%) stock; and that the Government take common shares at par in payment of its existing advances to the various systems. These advances on December 31, 1920, amounted to \$320,000,000 of loans and \$33,000,000 of Grand Trunk Pacific debentures. The cost of the Intercolonial and National Transcontinental railways should be written off at once. For the future, any expenditure that should properly be charged to capital should be provided by the Government and for these advances from year to year the Government should receive preference stock at par. All deficits which the Government had to meet should be settled by giving to the Government common stock at par. The company would then issue preference stock only against capital expenditure advanced by the Government, and the common stock would be issued to the Government in payment of its advances to meet operating deficits, including fixed charges. In this way the common stock would represent the cost of acquiring the system plus the amount of the operating deficits from year to year, and the preference stock would represent the amount of capital expenditure made by the Government upon the railway system after its unification. Of course, the obligations of the railway company to the outside public would be represented by the bonds, debentures and guaranteed stock outstanding.

Of the many criticisms of this plan which suggest themselves to the thinking mind, I shall mention but one, namely, if, as Sir Joseph states, "the annual deficits in operation and fixed charges are an actual and irrecoverable loss, and should not be carried as an active debit against the railway," why not honestly though sorrowfully charge them off as losses instead of using them to swell the capital stock account of the Government? If they are losses that are irrecoverable, they can never be transformed by any accounting device into capital in the hope that some dim and distant day in the future the company will be able to pay dividends upon them.

In this contribution to the railway problem by one who has been a very successful business man and who has rendered distinguished service to his country, we find too many "ifs" and other conditional statements to give any comfort to the supporters of the policy of public ownership. Indeed, that does not seem to have been the primary purpose in its writing, but rather to tell the truth about the railways, no matter how harsh the truth may be.

BILL INTRODUCED IN FAVOR OF ST. LAWRENCE PROJECT

ACCEPTANCE by Congress of the report of the International Joint Commission on the Great Lakes-St. Lawrence Waterway is proposed in a bill introduced by Representative Mapes, who proposes that the commission's recommendation be adopted by Congress, subject to such further diplomatic negotiations between the United States and Canada, and such action by the appropriate legislative bodies of the two Governments, as may be necessary.

The measure also would authorize and require the President to enter into negotiations with Canada for the purpose of establishing an International Board of Engineers to work out and report within the year detailed plans and specifications for the construction, operation and control of the waterways. The United States and Canada would have equal representation on the board and would share expenses equally.

Canalization of the St. Lawrence River will not only be a great international asset commercially, but will also promote already friendly relations between United States and Canada, declared John A. Russell, president of Detroit Board of Commerce, speaking to the Windsor, Ont., Chamber of Commerce.

COMMODITY PRICES APPROACHING NORMAL LEVEL

COMMODITY prices on the average are apparently approaching a normal level after war-time inflation and the consequent deflation of 1921. This is shown by the accompanying chart supplied to "The Canadian Engineer" through the courtesy of Dwight P. Robinson & Co., engineers and contractors of New York and Montreal. The price chart which covers the period 1860-1922 and all commodities, has been plotted from official figures from the United States Bureau of Labor. The dotted line drawn from 1896 through 1914 charts, shows the gradual rise in prices following the panic of 1893 and indicates gradually improved standards of living and wage conditions.

This price movement, which was entirely normal, would doubtless have continued if the war had not intervened. Therefore, in seeking to determine a normal price level, it is more logical to base considerations on the prolongation of this 1896-1914 line rather than on the average for 1914, which is shown on the chart to be 100. The dotted line reached 115 in 1922; therefore the price index of 149 for January 1 for all commodities is only 34 points above the level which might have been normal but for the war. Considering economic conditions throughout the world, this increase is not considered so unreasonable.

Substantial price decreases from the peak of 1920 took place in 1921 in almost indirect ratio to the percentage in which the ratio of the gold reserve has been increased by

The index figures for lumber and building materials in December 1920 was 266, and for the period from April to December, 1921, was as follows: 203, 202, 202, 200, 198, 193, 192, 197, 203. This seems to indicate a fairly stabilized condition. If demand during 1922 continues to be strong, it is doubtful if appreciably greater reductions will take place.

Referring to the chart it will be noticed that during the period May 1920 to July 1921, deflation was consistent and rapid, and a drop of 124 points from the peak was registered. The turning point came in August and from then on the detail of the curve was as follows: August 1, 148; September 1, 151; October 1, 152; November 1, 150; December 1, 149; January 1, 149.

MAY EXTEND TORONTO SUBURBAN AREA

A PROPOSAL to extend the suburban area of Toronto will shortly come before the Ontario Railway and Municipal Board, if the plan as now designed receives the approval of the city council. The city assessment department, under T. D. LeMay, has been working under the suburban area legislation received by the city since 1912, and the time has arrived when it is considered that an amendment to the area plan must be made in order to attain the desired results. The area in which the city has been working comprises the territory within a five-mile radius of the

CHART SHOWING RELATIVE PRICES OF COMMODITIES FROM 1860 to 1922

the recall of federal reserve notes. According to a recent Federal Reserve System statement this gold ratio increased from 54.8 per cent. to 105.5 per cent. in 1921, probably indicating complete deflation in the currency. Prices of several classes of commodities which fell rapidly during 1921 have now apparently become somewhat stabilized. For instance, the price index for lumber and building materials on January 1 showed an increase of 6 points over the figures for December 1, thereby registering the second increase in 14 months. This rise in the index is undoubtedly the result of the steady demand for building materials indicated by the latest construction reports available for 1921, which show a total volume only slightly below 1919.

The similarity between the price curves for the two war periods is strikingly shown by the chart, the upward trends in each case being almost exactly alike. Price conditions during and following the Civil War were entirely the result of the business and financial situation in North America, while the recent inflation and subsequent deflation resulting from the Great War were general with few exceptions throughout the world.

The index figure for metals and metal products in December, 1920, was 157, and for the last three months of 1921, October, November and December, was 121, 119, 119.

city limits. The proposed plan would be square, instead of circular; its outlines being farther removed from the city limits in order to embrace territory not at present included either in the city zone or that of any of the urban municipalities, which, under the act, may control the area within three miles of their borders, where it is not part of the larger zone connected with the city.

Power has been turned on at the Grand du Bonnet power plant which will enable the work of construction to make better progress.

Premier Drury has promised the Ontario Housing and Town Planning Association that a committee of the Legislature will be appointed to codify laws relating to city planning in Ontario, and to suggest such amendments as may be necessary to give municipal town planning boards sufficient powers under the direction of municipal councils. The premier is also considering a request that \$2,000,000 of federal funds for housing loans be applied for at an early date. It is understood, however, that the premier is not favorable to further provincial participation in civic housing.

RECONSTRUCTION AND RESURFACING OF OLD PAVEMENTS

Brooklyn Adopted Recut Block Method of Granite Pavement Construction and Heater Method of Asphalt Resurfacing — Extracts from Specification

By J. Schmitt

Bureau of Highways, Brooklyn, N.Y.

NOT many years ago the determination of the necessity for repaving a street was a simple matter. A pavement was either serviceable or it was worn out and required replacing. An asphalt pavement whose surface had become uneven, or whose maintenance costs were prohibitive, was removed and replaced with new. A granite pavement which had become unduly rough through wear, was removed and a new pavement substituted. Modern traffic, however, has introduced a condition under which a pavement may be entirely unsatisfactory without being near the end of its life. Such is the case when granite blocks have become worn to a degree of roundness on top as to cause undue noise and vibrating under heavy traffic, and in the case of asphalt when irregularities or waves have reached the point of causing similar vibration and discomfort to occupants of vehicles. Complaints in increasing number are heard from residents, of the annoyance and damage caused by vibration transmitted to buildings from pavements of irregular surface under heavy traffic. Building improvements on a street are frequently of mixed character, or are undergoing change from residence to business, residence to factory, and the like. In many cases the type of pavement suits the average condition, but minority interests also demand consideration.

To remedy the condition arising from the use of a pavement of suitable character, but of indifferent state of repair, though not worn out, the recut block method of granite pavement reconstruction was adopted in Brooklyn and the heater method of asphalt resurfacing. These utilize the material at hand to a great extent, requiring relatively small additional quantities of paving materials; they produce a surface comparing in every respect with a new pavement; and they do this at a much reduced cost as compared with the price of a new pavement.

Granite Pavement Reconstruction

In repaving a granite paved street, the old material, where discarded, has but little salvage value to the community, because of the uncertain market for second-hand paving blocks. Contractors can afford to make but little difference for such blocks and in consequence the community bears in full the value of the new blocks required. Why, therefore, should not the market for the old blocks be made on the job?

The blocks on many streets requiring reconstruction are of the old type, large size, 10 to 15 in. long, 3½ to 5 in. wide, and 7 to 8 in. deep. The size in use today is 8 to 12 in. long, 3½ to 4½ in. wide, and 5 in. deep. The cubic content of the old type block is practically double that of the newer type, so that two blocks can be produced from one. This is therefore done by splitting the old block through its centre and redressing the resultant two blocks. The heart of the old block becomes the head of the new. In many cases it is not possible to obtain two blocks from one, owing to defects in the old stone, but the percentage of blocks suitable to produce two recut blocks is generally sufficient to overcome the loss in recutting and rejects. Experience has proven that the gain and loss practically balance. As a rule there is a small surplus of blocks and in only a few cases has there been a deficiency. The only difference made in the size of block from current specifications (Brooklyn) for improved granite block is that the minimum of block allowed is 6 in., as against 8 in. for new blocks, with a minimum width of 3¼ in. as against 3½ inches.

These blocks are laid to the same specification requirements as for new blocks, with ½ in. maximum joint and 1 in. cushion, and bituminous or grout joint filler. The

concrete foundation is built up by a full 3 in., the difference between the old 7½ in. block on 1½ in. cushion and the recut 5 in. block on 1 in. cushion. The following is an extract from specifications for this class of work:

"When the use of blocks recut from old granite blocks is permitted under the contract, such blocks shall comply with the specifications for quality as required for new blocks, and be of the following dimensions: not less than 6 in. nor more than 10 in. long on top; not less than 3½ in. nor more than 4½ in. wide on top, and not less than 4¾ in. nor more than 5¾ in. deep. The recut blocks shall be dressed in the manner specified for new blocks; the sides and ends shall be sufficiently smooth to permit of the blocks being laid with joints not exceeding ½ in. in width at the top and for 1 in. downward therefrom, and not exceeding 1 inch at any other part of the joint. The blocks shall be cut so that the faces will be approximately rectangular in shape. The top surface of the block shall be cut so that there will be no depression measuring more than 3/8 in. from a straight edge laid in any direction on the top and parallel with the general surface thereof."

Of this type of reconstruction pavement there had been laid in Brooklyn N. Y., approximately 4,000 sq. yds. in 1919, 11,000 sq. yds. in 1920, 48,000 sq. yds. in 1921, with 62,000 sq. yds. now in progress on under contract. The recutting of the blocks costs about \$30 per thousand against a price on the work for new blocks of \$130. This difference is partially counterbalanced by the average size of the blocks, which run about 40 to the square yard, against 28 for new blocks. In September, 1921, bids were taken for new and recut granite pavements, the new being priced at \$5.25 per sq. yd. for pavement only, as against \$2.77 for recut blocks.

The results obtained have been entirely satisfactory and the saving in cost substantial. While old pavements may be so worn as to be useless for recutting, the method offers a practical solution of the problem of salvaging granite pavements which are worn but not worn out.

Asphalt Resurfacing

The Borough of Brooklyn, N.Y., with its 11,000,000 sq. yds. of asphalt pavement, has experienced the difficulty of keeping such pavements in repair to a greater extent than most municipalities. The older pavements were laid without the careful attention to formula now given, with the result that much creeping and pushing of these pavements occur under modern heavy traffic. Though far from worn out, their surface may be distinctly irregular and wavy. The asphalt may have in it years of life, but be in such condition as to surface that a general overhauling is necessary. This is accomplished by the heater method of resurfacing. The surface of the pavement is heated to a temperature such that about ½ in. of its surface is softened and can be scraped off. A layer of new asphalt surface mixed is spread upon the heated surface and rolled and finished in the same manner as surface otherwise laid. If properly applied, this method produces an excellent bond. Many test cuts have indicated perfect adhesion of the new asphalt to the old, and the maintenance costs on resurfaced streets compare favorably with new full depth pavements. The heater used is designed to soften the pavement by hot air blast, the flame not being permitted to impinge on the surface. The new layer is laid to an average thickness of one inch. In preparation of the work before applying the heater, all excessive waves or hummocks are removed by cutting down to the foundation. The asphalt used is similar in formula to that employed on heavy traffic streets, its composition being as follows:

Passing 8-Mesh sieve, retained by 10-mesh sieve—	0% to 5%
" 8-mesh " " " 40-mesh " "	—25% to 45%
" 40-mesh " " " 80-mesh " "	—20% to 55%
" 80-mesh " " " 200-mesh " "	—10% to 30%
" 200-mesh " " "	—13% to 20%
Bitumen—	9.5% to 12.5%
Penetration of A. C.—	35 to 45."

Should the old material be of doubtful stability, the use of the surfacing of stiff mixture serves as a protective coat and minimizes the creeping of the pavement.

This method has been used with success on streets of moderately heavy traffic, but its field lies chiefly in the improvement of pavements subjected to average traffic of residential sections and secondary arteries.

The following extracts from specification for such work are submitted:

"The repaving or resurfacing of the asphalt shall be done by process or method of heating and removing the surface of the old pavement by means of a properly constructed surface heater. The essential feature of this heater shall be that no flame comes directly in touch with the surface to be heated or softened. Its general construction shall be such as will admit of heated air being blown upon the surface of the old pavement to be removed, thereby heating and softening it so that all inert, disintegrated, worthless, and uneven or irregular surface material can be easily removed by means of hoes, rakes, or other appliances.

The contractor shall use proper guards to prevent the heat from cracking or injuring the curb, headers, or other structures along the line of work. He shall prevent the heat emitted from the stack from injuring trees or shrubs.

Where excessive waves or hummocks exist along headers and around manholes or wear holes, the contractor will be required to remove the old material by cutting to the foundation, where directed by the engineer and replacing it entirely with new material.

The surface of the old material must be clean, soft, and hot at the time that new material is laid thereon. Should the surface become chilled, hardened, or dirty, it must be reheated and again cleaned before new material is applied.

After the surface of the old material has been properly prepared, a coating of new material shall be laid thereon to such a thickness as to give when rolled, a layer of new material over the old not less than $\frac{3}{4}$ of an inch in thickness and averaging as nearly as possible one inch in depth, after rolling."

In the Borough of Brooklyn 50,000 to 100,000 sq. yds. per year of heater resurfacing has been carried out for some years past with entirely satisfactory results.

The price in September, 1921, was \$1.09 per cu. ft. of wearing surface mixture of \$1.68 per sq. yd. This compared with a price for asphalt only laid on the old foundation of \$2.25, including removal of the old pavement. In September, 1920, the price was \$1.43 per cu. ft. or \$2.03 per sq. yd. comparing with a price of \$3.65 for specification asphalt. The price of resurfacing, therefore, ranges from 60 to 70 per cent of new asphalt, exclusive each of foundation.

This method is believed to be the most practical for salvaging the useful part of an old asphalt pavement. The material requiring handling is reduced to a minimum; the work is performed expeditiously and with the least possible inconvenience to residents on the street. Various methods of re-employing old asphalt in the preparation of a new mixture have been tried with varying success. The heater method, however, has been successfully used for years, and while the saving effected is less than in the case of the recutting of granite blocks, it is substantial and is supplemented by the comfort to residents in having a repavement started and finished the same day.

Representatives of over seventy municipalities held a meeting in Toronto on February 16 to register a protest against the Provincial Government interfering with the hydro-radials. A vote of confidence in Sir Adam Beck and his work was passed.

It is reported that the Canadian members of the International Joint Commission will tender their resignations on account of the change of government at Ottawa. The commission consists of C. A. Magrath, chairman, Sir William Hearst and H. A. Powell.

DILUTION IN THE TREATMENT OF SEWAGE

By Peter Gillespie

Prof. Civil Engineering, Faculty of Applied Science, Toronto University

THE function of dissolved oxygen in a stream or other body of water is in the conversion of organic matter into stable and inoffensive forms. Fresh water when saturated with oxygen, contains at freezing temperature about 6 grains of this element per cubic foot, decreasing to about two-thirds of that amount at summer temperatures. Such oxygen is abstracted partially or completely from the stream into which organic matter in the form of sewage is discharged, the abstracted oxygen being necessary in the processes of wet combustion which proceed in the stream. It has been figured that a million gallons of average American sewage requires for its oxidation about 1000 lb. of oxygen. The resulting depletion of the oxygen content of the stream is often readily apparent.

When the content falls below 70% of saturation, major fish life disappears and when 30% of saturation is reached a condition approaching a nuisance especially in hot weather is the result. Put in another way, a stream flow of 2 cubic feet of water per second per thousand of the population will be the very minimum for the prevention of offensive conditions. Since, however, it is undesirable that most of the oxygen be abstracted from the stream and since also, thorough dispersion of the filth throughout the water is never attainable, a stream flow of 4 or perhaps 6 cubic feet per second per 1000 of the contributing population is much more likely to result in the absence of nuisance. Such a stream will obviously lose much of its natural attractiveness.

The speaker described the methods of bacteriological examination of waters and the significance of the presence of the colon bacillus, qualitatively and quantitatively. If this organism be present in large numbers, sewage contamination is likely to be recent and in relatively large quantity. The possible presence of pathogenic bacteria is also thereby indicated.

The tentative standards for sewage effluents of the Royal Commission on Sewage Disposal in which the maximum permissible amount of suspended matter contained was specified, as were also the more recent ones of the International Joint Commission on the Pollution of Boundary Waters for the Detroit and Niagara Rivers. The 500 B. Coll per 100 c.c. standard suggested by the latter Commission is a moderate maximum in comparison with what some water filters in America are obliged to cope with. The self purifying capacity of large bodies of water is shown in that while the pollution of Lake Ontario at the mouth of the Niagara River is very great, at a distance of 18 miles lakeward from this point, it disappears practically altogether judged by the non-occurrence there of the colon bacillus. The purifying power of nature assisted by time, accomplishes here what human agencies and human resources find it impossible to duplicate.

In reference to the complete purification of sewage before discharge into a stream as against the purification of the public water supplies drawn therefrom, Mr. Hazen was quoted to the effect that it is unmistakably better to purify the waters taken from the rivers than to purify the sewage before it is discharged into them. In the first place it is cheaper since the cost of purifying 1,000,000 gallons of water is less than the cost of purifying the same quantity of sewage. In the second place it is more effective since few plants treat all the sewage from the districts which they serve.

The speaker reviewed American and Europe practice in respect to sewage disposal as exemplified in half a dozen typical plants and the reason for the selection of the special feature in each. Dyckman Street Station, Manhattan, with fine screens only; the Enscher Valley with sedimentation only; Atlanta, Ga. with screens, sedimenta-

tion and percolating filters; Trenton, N. J. where sedimentation only for the present is proposed; Worcester, Mass., with sedimentation and sand filters; and Brampton, Ontario, with its activated sludge were among those described.

In conclusion, the speaker enunciated these five principles as indicating the trend of practice today in the art of sewage treatment:—

1. Streams are at once the drainage channels and the sources of public water supply of a country.
2. No sewage should be discharged into a stream without some measure of treatment; no public water supply should be taken out without some measure of treatment.
3. Complete purification of sewage is less effective and more costly than a partial purification of the sewage followed by a purification of all water supplies.
4. A wise policy is the design of a plant anticipates the growth of the future and provides for it.
5. Dilution is one of the oldest as well as the most modern of methods. From a paper read before the Peterborough branch of the Engineering Institute of Canada.

Boving & Co., Ltd., London, England, have recently been awarded a contract by the Government of New Zealand for water turbines in connection with the Mangahao hydro-electric power scheme. The order includes the supply of five main Pelton wheels—three, each having a maximum output of over \$8,000 brake h.p., and two, each over 4,000 brake h.p.; also two smaller exciter Peltons, each 325 brake h.p. The wheels will work under an average head of water of 825 ft.

The election of officers of the Engineers' Club, Toronto, took place last week and the following were elected: J. B. Carswell, president; W. R. McRae, first vice-president; E. G. Hewson, second vice-president; A. B. Cooper, third vice-president; Directors, J. C. Armer, F. R. Ewart, C. H. Heys, A. H. Hull, T. D. LeMay, Balmer Neilly, Geo. G. Powell, A. V. Trimble, W. F. Wright, E. W. Wright, T. S. Young; Secretary-Treasurer, R. B. Wolsey. The report presented showed a satisfactory year's operations, and a substantial balance to the credit of the club.

MASONRY WAS REPAIRED BY CEMENT-GUN

LAST year the Public Utilities Commission of the town of Napanee, Ont., instructed their engineers, Messrs. James, Proctor & Redfern, Toronto, to prepare a report and tenders on repairing the headrace and canal, which supplies the water to the town, for developing the power to run the water works system and furniture factory.

REINFORCEMENT IN PLACE AND GUN OPERATOR AT WORK

This canal, which is approximately 1,000 ft. long, is constructed of masonry and was built some thirty years ago. Its condition became such that the embankment was

SHOWING CONDITION OF MASONRY BEFORE REPAIRS WERE MADE

in danger, and a leakage was causing trouble in the loss of head.

The engineers, knowing what had been done by "Gunite" in repairing such walls as Governor's Island sea wall, New York; the sea wall at Bridgeport, Conn.; masonry bridge arches at Lancaster, Pa.; masonry in Chicago Drainage Canal; Grand Trunk Railway bridge piers at Weston, Ont.; masonry sewers at Dayton, Ohio, etc., as well as many

SECTION OF COMPLETED CANAL

dams, reservoirs and ditches, placed a contract with the Gunite Co. of Canada, Ltd., Hamilton, Ont., to carry out this work.

Specifications called for the walls to be built up to the original shapes, the masonry cleaned by sand blast or wire brushes and a reinforcement of 2-in. hexagonal mesh 14 gauge or equivalent, to be fastened in place; a coating of "gunite" 2 in. thick of a mixture of one part cement to three parts sand, to be then applied. This coating was carried up the face of the walls, over the top and down the back for 12 in. The actual working time was fifteen days, and a type N-1 Cement-Gun operated by a Chicago Pneumatic portable compressor was used on the work.

Government consideration of the report of the Joint International Waterways Commission on the proposed deep water route from the Atlantic to the Great Lakes will probably be given between now and the opening of parliament.

EXPERIMENTS ON AIR-LIFT PUMPING

Details of Experiments Conducted at St. Domingo, Portugal
— Causes of Loss in Efficiency — Advantages of Air-
lift Pumps — Discussion on Dr. Owens's Paper

IN a paper read before the British Association of Edinburgh, Dr. J. S. Owens, B.A., briefly described his paper on Air-lift Pumping, in which he dealt with the possibilities of the air-lift pump rather than indicated any final conclusions as to the best design of such pumps.

The results of past experience had shown that the air lift was usually an extremely wasteful method of pumping, owing to its low efficiency, but it appeared that if this low efficiency could be overcome, there would be an immense field for the use of the air lift pump.

The experiments described were made with a view to ascertaining the most efficient design for an air lift pump, for lifting acid mine liquors in the mine of San Domingo, in the South of Portugal. With the installation finally adopted, tests showed that it was quite possible to get pump efficiencies with air lifts of between 60 and 70 per cent.

A study of the work already done on air lift pumping had convinced Dr. Owens that the low efficiencies usually obtained — it would appear that to expect an efficiency of 45 per cent. from an air lift pump was regarded as optimistic — were not an essential part of the method. The causes of loss in these pumps might be grouped under the following heads:

- (1) Slippage losses, due to relative motion between air bubbles and water.
- (2) Losses due to friction of the mixture of air and water in the rising main.
- (3) Friction losses incurred by the flow of water before air is admitted.
- (4) Energy discharged in the kinetic form with the water, and due to the velocity of discharge.

Cause of Losses

The losses under the last two headings were definite quantities, and might be said to be more or less under control; it was in connection with (1) and (2) that there appeared to be good opportunities for increased economy. From experiments made on the question of submergence, it had been definitely established that there was a most suitable value for this, the best efficiency being obtained with a submergence of about 70 per cent. of the total length of the pipe—submergence plus lift. The point to be kept in mind was simply that the relation of submergence to lift had an important bearing on the efficiency, and in some of the author's experiments it was seen that an appreciable effect was obtained by even small variations in submergence.

The theoretical aspect of the losses due to the four heads mentioned was briefly dealt with, and experiments which were carried out to examine the relation of diameter of bubble to velocity of rise through the water, and the conditions governing the size of the bubbles, were described, it being now generally accepted that the air lift depends for its operation upon the fact that a mixture of air bubbles and water is lighter than pure water. So far as slippage losses are concerned, a high velocity of the mixture tends towards a low slippage loss. From the results of tests on friction, the author had calculated the coefficient of friction and obtained a value of 0.025 in a 6% in. pipe with a mean 13.3. In this case, however, friction losses included all losses except slippage losses, friction losses before the water arrived at the footpiece, and losses in kinetic energy of discharge. As to this latter, it was well known that a fair amount of energy might be lost by delivering the water at too high a velocity, but this was easy to avoid, by using a conical or trumpet-shaped expanding mouthpiece to the delivery pipe.

The paper then described the air lift pump at San Domingo, already referred to. The installation is in two lifts. The bottom or No. 2 lift, raises the water from the 210 m. to the 180 m. floor, where the discharge from lift No. 2 is received in a large tank or pool, which pool forms

the inlet to lift No. 1. The latter raises the water from the 180 m. to the 150 m. floor. There is no submerged pipe, such as is used in tube wells, but the inlet pipe is carried down a shaft in the form of a U-tube, the air admission foot-piece being fixed a little above the head at the bottom of the U on the eduction pipe. This has the same effect as submergence, although to travel down the descending lift of the U. All pipes are lined with lead, and the air is made of lead, since the liquor is of a very corrosive nature, and rapidly attacks cast iron. The No. 2 lift was put in early in 1920, as an experiment, with the intention of completing the installation by adding the No. 1 lift if it proved a success. The result of the tests made after the installation showed an efficiency of over 60 per cent. for the experimental pump, which was considered to justify after adding the second lift.

Dealing with the advantages of the air lift over other methods of pumping for this type of work, provided a reasonably good efficiency could be obtained, the author said that there need be no machinery underground nor need any machinery be exposed to the acid liquors. The amount of attention and repairs required for an air lift were negligible, as compared with other pumps, such as, for example, ram pumps. At San Domingo a three-throw electrically-driven ram pump was displaced by the air lift. The electric pump was a continual source of trouble, and required great attention to keep in order, as pump and motor had to be fixed in a chamber in the mine, and were constantly exposed to drips of acid liquor. In designing the air lift pump, the main objects aimed at were to provide a smooth, unobstructed flow of water through the pipes, avoiding any method of introducing air which interfered with this object; to keep the bubbles of air in the eduction pipe as small as possible; by the use of a Venturi throat at the air admission footpiece to arrange for uniformity of pressure at the top and bottom of the throat piece, so that the air distribution could be controlled; to avoid a sudden increase of velocity at the footpiece, and to bring about the necessary change of velocity in the water resulting from the admission of air as gradually as possible.

An illustration of the footpiece showed that the air was admitted into an annular chamber surrounding a Venturi throatpiece, the latter being perforated with a number of holes of $\frac{1}{8}$ in. diameter, starting from the narrowest part of the throat. The diameter at the throat was such that the loss of head due to the velocity at the throat would somewhat more than balance the static head due to the increased depth at the throat. The length of the throatpiece was fixed so that the angle of opening of the trumpet-shaped upper part should not exceed 5 deg. The holes were distributed in rings around the throatpiece, the number per ring gradually increasing towards the top, so that as the air was added to the water, and the velocity thereby increased, the rate of increase would be such that the velocity head would vary uniformly. From 550 to 600 holes were used. The footpiece was of cast iron lead lines, and designed to simplify the changing of the throatpiece, so that different forms could be experimented with. The supply of compressed air was from the air line supplying the mine, and no special compressor was required. The air was at 80 lb. per sq. in., and this determined the maximum submergence possible to use.

The results of the tests showed that the efficiency of No. 1, or upper lift, varied between 56.6 per cent. and 61.13 per cent., while the efficiency of No. 2 varied between 52.5 per cent. and 66.1 per cent. The conditions under which the tests were made were varied, with the object of ascertaining the best form of throatpiece, and the tests were made with three different forms of throatpiece, varying in diameter at the throat between 3.25 in. and 4.59 in. The throatpiece with the smallest diameter gave the highest efficiency. A further pair of throatpieces were now being experimented with, in which the diameter of the narrowest part was 2½ in. The discharge ends of the eduction pipes were enlarged by a taper piece up to 18 in. diameter, in order to minimize the loss in kinetic energy of the water. In some tests the footpiece was fixed so that the centre of the air inlet pipe was 3 ft. above the

top of the bend in the water pipe, but this was found insufficient, as there was a great tendency for the air to blow back round the bend and momentarily reverse the action of the pump. The foot piece, therefore, was lifted to 12 ft. above the bend, and this was found effective in preventing such blow backs.

The operation of starting the pump might be divided into stages, as follows: (1) Compressed air is admitted to air pump until head of water is just balanced; the air pipe is then full of air to footpiece, but no air has yet entered rising mains; (2) the water in the rising mains is at rest. Air is admitted to rising main, but as there is no water current to carry it away, it probably collects in large plugs or one large plug above footpiece, displacing the water until the latter reaches the top and overflows; (3) when the water overflows at the top, the pressure on the column of air is relieved and it expands, causing a greater overflow, and if the plug of air is at the bottom of the rising main, or anywhere well below the top, as the column of water is removed it tends to expand with explosive violence; (4) the relief of pressure on the rising main is so rapid that it cannot be compensated for by flow in at the bottom, and therefore, the pressure in the air pipe will fall, to recover gradually as the rising main fills from below; (5) during stage 4, when water is flowing past the footpiece, the air has a chance of mixing with the water, and, if enough air is then admitted, continuous flow will result. If, however, insufficient air is admitted, it may be sufficient only to keep the water near the level of delivery without overflowing. This method of starting appeared to be almost an essential under the particular conditions.

The advisability of admitting the air where the velocity is highest, i.e., at the narrowest part of the throat, is now being tried, but it is questionable whether other drawbacks will not neutralize any advantage thus gained. The expedient of using an eduction pipe of gradually increasing diameter from the footpiece to delivery is useful if it could be applied, so that the velocity of the mixture is kept uniform instead of increasing, as it must do in a cylindrical pipe, owing to the expansion of air. There is, however, great difficulty in applying it practically, where conical pipes are very costly, and instead of a gradual change of diameter it is usually enlarged in steps, with consequent loss at each step. It seems doubtful, said the author, if there is much advantage to be gained in this way over a short, trumpet shaped or conical delivery end with sides at 5 deg. or less.

Discussion on Air-lift Pumps

The chairman referring to air lift pumps said that Mr. A. W. Purchas, in a paper published some time ago, had stated that the theory on which the air lift pump should be designed was the displacement theory. Mr. Purchas had assumed that the operation of the air lift pump was due to the formation of a fairly large bubble, which rose to the top and displaced the water; this bubble was followed at some distance by another large bubble. He did not think the pump worked under the most efficient conditions when the rising main was filled with a mixture of small bubbles and water. He (the chairman) could not believe that.

Dealing with Dr. Owen's paper, Prof. Lea said that the air lift pump had great advantage, because all the machinery could be installed on the surface. Centrifugal pumps, for instance, had a lift of not more than 25 ft., and when a lift of 100 ft. was desired, a centrifugal pump would have to be installed in a wall near the surface to be lifted. In certain cases either air lift or reciprocating pumps were essential. He would like the author to give figures of efficiency of air lift and reciprocating pumps, taking into account the cost of air compressors and everything else. Probably with long continuous working one would not get more than, perhaps, 50 per cent. efficiency with an air lift pump, whereas high lift reciprocating pumps might show an efficiency of over 80 per cent.

Dr. Owens, in reply, said he had tried to agree with Mr. Purchas's displacement theory, but had been unsuccessful. It was quite certain, from his experience of the

air lift pump he had described, that the discharge from the air lift, when working properly, was a mixture of small bubbles and water. As a matter of fact, he was of the opinion that the description in Mr. Purchas's paper indicated that his efficiency was due to small bubbles. Regarding the general utility of air lift pumps, in the particular case dealt with, he had calculated that if the air lift gave an efficiency of 40 per cent. it would cut out the existing arrangements; actually, he was getting an efficiency of 60 per cent. With careful design, one could calculate on getting an efficiency of well over 60 per cent. Previously the electric pump had been installed in a little cell hewn out of the rock at a depth of about 150 m., and there was a constant rain of acid from the roof, which was extremely corrosive; even monel metal was dissolved like sugar. Under such conditions as he had described the air lift pump was most useful.—From a paper read before the British Association at Edinburgh.

U. S. SENATE ISSUES REPORT APPROVING ST. LAWRENCE WATERWAY

A REPORT has been issued by the United States Senate, under the title "Extract from the Report of the International Joint Commission concerning the improvement of the St. Lawrence River for navigation and power." Part 6 of the document contains the conclusions and recommendations of the International Joint Commission. "An analysis of the testimony submitted makes it clear" says the opening paragraph, "that the consensus of opinion in the two countries, as revealed at the public hearings, while far from unanimous, was on the whole distinctly favorable to the proposed improvement of the St. Lawrence. Broadly speaking, it may be said that public sentiment throughout the middle western and western states from Ohio to Idaho, was almost unreservedly in favor of the deep waterway." The only evidence submitted on behalf of the Mississippi Valley was also favorable. Various organizations and the individuals in the Eastern States expressed themselves as approving of the project. On the other hand, evidence was not wanting of a widespread sentiment in some of the Eastern States antagonistic to the project. On the Canadian side, anything like general approval of the undertaking was confined to the province of Ontario. In the other provinces public sentiment appeared to be either indifferent or more or less hostile.

Alternative Routes

"In the first place it appeared at the hearings that many Canadians were pre-occupied with the merits of alternative routes to the seaboard. This was particularly noticeable in the western provinces, where keen interest was expressed in the possibilities of the Hudson Bay route, to which the Dominion Government had more or less committed itself some years ago, and upon which it has already expended over \$20,000,000 and expects to spend another \$17,000,000. In the east a similar sentiment was found in Montreal and North Bay favorable to the proposed Georgian Bay route, which has been before the Canadian people for many decades.

"The opposition to the suggested improvement centred largely in the State of New York, but was also supported by representatives of various public bodies in New England and in some of the Atlantic coast points south of New York, as well as in the city of Montreal. The commission is satisfied that many of those who have opposed the project did so because they were convinced that it was impracticable and not in the public interest. It is equally satisfied, however, that much of the opposition had its source in what might be called local patriotism. That is to say, that many citizens of Buffalo, Montreal, New York, Albany, Boston and Philadelphia were determined to oppose the project mainly because they believed that it would adversely affect the interests of Buffalo or Albany, or the New York barge canal, or of the great seaports of New York, Philadelphia, Montreal and Boston. In the other hand, the de-

mand for the waterway comes from the area which is most vitally concerned in the opening up of a new transportation route to the seaboard.

Navigation Problems

"The commission believes, from the evidence before it, that ocean-going ships of suitable draft would find no serious difficulty in navigating the deepened St. Lawrence. The physical obstacles which, in the opinion of opponents of the undertaking, would make the proposed waterway impracticable, are its long, restricted and tortuous channels of insufficient depth, fog and ice conditions, time loss and damage sustained in getting through locks, and the limited navigation season. The commission's conclusion that these physical obstacles would not be sufficient to deter ocean-going ships from coming up into the lakes is based, among other things, on the two unquestioned facts that for many years past ocean-going ships have successfully navigated the St. Lawrence for a distance of approximately 1,000 miles, and that at the same time the big lake freighters have successfully navigated the Great Lakes and their connecting channels."

The report discusses the project from the economic and the engineering point of view and, in harmony with its conclusions, recommends that the Governments of the United States and Canada enter into an arrangement by way of treaty for a scheme of improvement of the St. Lawrence river between Montreal and Lake Ontario; and that the new Welland Canal be embodied in the said scheme and treated as a part thereof.

MOTIVE POWER FROM SEWAGE

ACCORDING to the London Times Engineering Supplement experiments in the utilization of sewage gas for the production of motive power are being made at Cole Hall, Birmingham, by J. D. Watson, the engineer of the Birmingham Tame and Rea District Drainage Board. The plant is designed to give 25 b.h.p. for a working period of six hours a day, and includes a 34 b.p. (maximum) horizontal gas engine of the ordinary suction type. The exhaust pipes from the engine are enlarged to 9 in. diameter and made to pass through the digestion or generating tanks with the object of imparting heat to the sludge, and so promoting fermentation. Two analyses of the gas, carried out in September and in the present month, showed 77 and 67.5 per cent. of methane, with 3.2 and 4.2 per cent. of hydrogen, the calorific value in the two cases being 700 and 650 B.Th.U. In describing the plant before a meeting of the Institute of Municipal and County Engineers at Birmingham, Mr. Watson estimated that the employment of the gas, instead of the ordinary suction gas plant that was originally proposed, means a saving of £29 10s. annually. The sludge at Cole Hall is bought by farmers for agricultural purposes, and so long as it can be got rid of in this satisfactory way there is no need to employ intensive fermentation. Only the sludge required to give off gas for power will therefore be subjected to fermentation, and from the limited experience at present available it is estimated that about two tons of wet sludge (10 per cent. dry solid matter) will be required to provide an explosive gas capable of generating 25 b.h.p. for a working period of six hours a day.

The Annual Convention of the American Association of Port Authorities will be held in Toronto, September 14, 15 and 16, 1922

At the Pittsburgh Experiment Station, in connection with the investigation of coal-storage problems, coal has been exposed to excess air for three hours at 150 degrees Cent.; the amount of oxidation products formed and the amount of oxygen absorbed are taken as a measure of the tendency of the coal to ignite spontaneously. The method has been tested on Newfield (Freeport) coal and Texas lignite with fairly consistent results.

Letter to the Editor

PUBLICITY FOR ENGINEERS

Sir: On page 188 of your January 31 issue, there is the following paragraph:

"There was considerable discussion regarding publicity for engineers in connection with a motion introduced by C. A. Mullen, but no suggestions of any value were forthcoming and the discussion was finally closed by Mr. Acres with the assertion that publicity will follow meritorious work without solicitation, and that if every engineer will do his work to the very best of his ability and do it faithfully and well, recognition and publicity and remuneration will follow as surely as night follows day."

It seems to me that this paragraph loses something by it not being stated therein that Mr. Blanchard of Niagara Falls was the seconder, and that the project had been discussed in the morning, and strongly supported by no less prominent a member than R. A. Ross, president of the Institute for 1920.

As far as I recollect, the only one who spoke against publicity for the engineer was Mr. Acres, and he is the only one whom you have quoted, though you were present both at the morning and afternoon sessions.

Mr. Ross remarked: "Something that Mr. Mullen has said has stirred me up. Nothing is ever done in this wicked world without propaganda. The thing for us to do is to get propaganda—absolute propaganda. Advertise ourselves and pay for it. That is the only way you can get it, and the question is whether the Council would not be well advised during the year to consider this matter very carefully."

Then Mr. Ross went on to state that we would shortly see initiated a campaign of publicity for a permanent "Research Institute" at Ottawa, for, said he, the Honorary Advisory Council for Scientific and Industrial Research had decided that a permanent "Research Institute" much broader in its scope than the present Advisory Council was necessary, and that they were going to get it for Canada by convincing the Canadian people who have the votes that parliament should enact a measure establishing such an Institute.

I do not see how you can countenance, without adverse comment, such a statement as that the doing of engineering work well will bring its own recognition and remuneration. Some of the most valued members of our profession get very little of either; while I, possibly, get more of both than I deserve. At present, I suppose, I have to find ways and means of advertising myself, without seeming to do so; I would far rather help advertise my profession, wisely and openly.

I am afraid that you have a wrong impression of what I mean by publicity for the engineer; it certainly has no relation to town-boasting campaigns or the work of commercial manufacturers' associations. What I do think is that the average man, and very many of the business men, do not know what engineering means to the community; very few even know the danger of proceeding with investigations and work without first submitting their propositions to engineering criticism. Much money is lost to the community in this way; and, in my humble opinion, most of our social evils are due to the fact that our political state is run by what we call political lawyers instead of by engineers.

Down with the Political Lawyers. All power to the Engineers.

LESSONS FROM THE KNICKERBOCKER THEATRE DISASTER

OUT of the confusion and conflict of evidence that usually attend any important engineering failure, it is difficult to formulate causes, more particularly if one is not in possession of first-hand information. However, with the report of the admirable investigation of the collapse of the Knickerbocker Theatre, Washington, Jan. 28, made by Engineering-News Record before us, we believe that certain general observations concerning this lamentable disaster, in which nearly 100 people lost their lives, may safely be made.

It appears that the structural steel framework supporting the roof, imperfect in design and detail though it may have been in some particulars, would in itself not have brought about failure. The assemblage of beams, trusses and columns would, according to our present information, have borne safely the design loads or the loads existing on the roof at the time, at substantially the assumed factor of safety. The supporting walls were able to support the applied loads, for in spite of the rough usage which they must have sustained in the collapse of the roof, they stood practically undamaged after the accident. There must, then, have been some source of weakness between raming and walls, if either was able to support the loads and with the combined action of the two elements, the roof fell. This inference, together with certain features of behavior of the roof in falling, gathered from markings and scorings on the truss seats, led the author of the report mentioned to conclude that the collapse originated in the dropping of the wall end of the principal truss in the ruff off its bearing on the wall, this circumstance entailing the fall of several auxiliary trusses and the other dependent construction.

Support is lent to this theory by the further fact that the trusses merely rested on these seats and were not bolted or otherwise fastened to them. There was consequently lacking what should be regarded as fundamental by all constructors of buildings — a secure tie between steel framing and the supporting walls. Without it, the cumulative effects of temperature and vibration may bring about, as they apparently did in the Knickerbocker theatre, a fatal horizontal separation of superstructure and supports.

A circumstance which prompts Engineering News-Record to some guarded speculation is the fact that the suspected end of the main truss rested at a sharp skew on a curved tile wall 18 in. thick and 35 ft. high to the bottom chord of roof trusses. Question is raised as to the effect of this skew and also of the deflection of the truss on a support of its kind. A field of study is no doubt opened up here. Some twenty years ago, startling things were found out concerning the weakness of skew arches, through the failure of an important arch in Australia, and it may chance that the effect of distortion in a pronounced skew construction may be to produce an unexpectedly heavy dragging effect on the supports. Further, the horizontal concavity of the wall with respect to the supported main truss in itself merits investigation. Unquestionably, a wall of such a shape in plan tends to yield more readily towards the outside than would one convex toward the interior of the building. Its action would be similar to that of a concrete dam arched downstream, as against one arched upstream. The fact that the curved wall now leans 5 in. into the street throws suspicion on the sufficiency of rigidity of this wall to maintain itself in position under the truss and beam loads.

A SERVICE TO THE ESTIMATOR

VALUABLE assistance has been afforded the estimator through the commendable investigation of prices of construction as determined by materials and common labor made recently by "Engineering News-Record." Everyone who has attempted to make use of cost data given in published articles and in handbooks has found it difficult heretofore to adjust the costs so given to suit existing conditions. Through the application of the "Engineering News-Record," construction cost index it should be a comparatively simple matter where the date of the original construction is given to render the data so furnished of value as a present guide.

It is of interest to note that the average cost index for the year 1921 is given as 201.78 based upon an Index of 100 for the year 1913, and that this index figure was 167.82 for December, 1921. While a substantial drop has occurred from the average of 1920, which was 251.28, we have still a long way to go on this continent to reach the pre-war level. That we are heading downward in construction costs is strikingly evident from the fact that while at the beginning of 1919 the price average of twelve representative construction materials was 69% above the general average of spring prices from 1913 to 1918 inclusive, at the beginning of 1921 the average had fallen to 31%, and at the end of 1921 it was only 2% above the chief average of spring prices for the nine years 1913 to 1921. While these figures were established for conditions in the United States, they apply fairly closely to Canada.

PERSONALS

J. J. McKAY has been elected chairman of the Hamilton, Ont., Town Planning Board for 1922.

CAMILLE LAURENDEAU, B.A.Sc., graduate of Laval University, son of Judge Laurendeau, of Montreal, has joined the sales staff of the MacKinnon Steel Co., Ltd., with office at 404 New Birks Building, Montreal.

COL. A. MacDONNELL and GENERAL J. STEWART, of Grant, Smith & Co., & McDonnell, Ltd., contractors of Vancouver, B.C., sailed from New York last Wednesday for England. They will visit the Gold Coast in connection

with an important contract which they have received from the British Government for constructing docks, breakwater and railway.

PAUL LECLAIRE has been appointed assistant chief engineer of the Port of Montreal. Mr. Leclaire was born in Montreal in 1881. He graduated from Laval Polytechnic School in 1901 and in 1911 was appointed engineer in charge of buildings, bridges and water supply to the Harbor Commission. Mr. Leclaire has also been engaged in engineering work in Pittsburgh, with the C.P.R. and the Dominion Bridge Co.

MICHAEL P. FENNELL, JR., secretary-treasurer of the Montreal Harbor Commission, has been appointed general manager, a newly-created office. Mr. Fennell, who is a native of Montreal, graduated from McGill University in 1903. He has been connected with the port for several years, first as secretary to Sir John Kennedy, then Robert McKay, and afterwards George W. Stephens. In 1917 he was appointed secretary-treasurer, which post he has filled with conspicuous success until the present time.

G. C. OMMANY has been appointed development engineer of the Development Branch, C.P.R. Department of Colonization, with headquarters at Montreal. Mr. Ommany joined the C.P.R. in 1907 and was engaged upon survey work, later being placed in charge of the harbor construction at Port McNicoll, Ont. In 1911 he went to the Pacific Coast where he was employed on harbor development work and later was appointed engineer of the Research Branch of the Department of Colonization.

GERMAIN P. GRAHAM has resigned as deputy city engineer of Albany, N.Y., in order to accept appointment as district engineer of the Asphalt Association, with headquarters in Toronto, Ont., and Albany, N.Y., covering the Provinces of Quebec and Ontario and the northern part of the State of New York. Mr. Graham graduated in civil engineering with the class of 1903 at Rensselaer Polytechnic Institute, Troy, N.Y., and immediately after graduation he entered the employ of the city of Albany as superintending engineer in charge of road and street construction, and has been engaged continuously in that work ever since, with the exception of 27 months overseas as captain and adjutant of the Twentieth Regiment (Engineers). Upon his

return from the war, Capt. Graham was promoted to the post of deputy city engineer. During the past few years Capt. Graham has taken a special postgraduate course in bituminous materials at Rensselaer Polytechnic Institute. He is president of the Associated Chapters of the American Association of Engineers in New York State. As district engineer of the Asphalt Association he succeeds Capt. Bruce Aldrich, who resigned from that position in May, 1921, in order to become a partner in the Provincial Contracting Co., Ltd., Toronto. In his work in Ontario and Quebec, Capt. Graham will be assisted by J. E. Pennybacker, Prevost Hubbard and the many other experts at the association's headquarters in New York, and he will also be at liberty to call for assistance at any time upon the technical staffs and

laboratories of any of the many large producing concerns who are members of the Asphalt Association.

T. W. HARVIE, Chief Engineer of the Montreal Harbor Commission, was born in Old Monkland, Scotland, in 1877. He was for six years on the engineering staff of the Clyde Engineering Trust and afterwards became engineer for Sir Robert MacAlpine and Sons on the construction of Yorkhill Docks. In May, 1907, he was appointed assistant engineer on the staff of the Montreal Harbor Commission and was for three years resident engineer on the construction of the new Victoria Pier and Market Basin, the shore wharves and the upper section of the High Level Railway. Mr. Harvey is an Associate Member of the Institute of Civil Engineers, London, England; Associate Member of the Engineering Institute of Canada, and a member of the American Association of Port Authorities.

OBITUARIES

WM. BOND, one of the oldest contractors of Woodstock, Ont., died there recently, aged 82 years.

ANDREW MAXWELL, a prominent architect and engineer, died at Holland, Man., recently, aged 77 years. The deceased was born in Montreal and graduated from McGill University in 1855. He took up survey work with the C.P.R. in 1872, and later with the Hudson Bay Co. He settled down in Holland in 1880 and has resided there since that date.

ARTHUR FERLAND, the well-known mining pioneer, died at Haileybury, Ont., on February 9. Mr. Ferland was born in Perth, Ont., in 1865 and at one time was connected with a firm of contractors. Ultimately he went to Haileybury and was one of the original stakers of the Nipissing Mine, and later became identified with the Chambers-Ferland mine.

NEW PUBLICATIONS

INSTRUCTIONS FOR INSTALLATION, OPERATION & MAINTENANCE OF W. & T. CHLORINE CONTROL APPARATUS. Wallace & Tiernan, Inc., Newark, N.J., have recently issued a most useful book for those who are interested in the installation and operation of their apparatus. Those who have charge of their machines will find this recent publication a most valuable help, for in addition to detailed descriptions of the various parts of the machine and careful instructions regarding their various functions, the booklet contains some very helpful diagrams showing just how the apparatus should be installed and those of our readers who have not yet secured a copy of this pamphlet are advised to write to Wallace & Tiernan, Ltd., 73 Adelaide St. E., Toronto, for a copy which will be gladly sent upon application.

ENGINEERING BULLETIN NO. 1 issued by the Maryland State Department of Health and compiled by chief engineer Robert B. Morse. The bulletin contains a number of papers selected from many that have been prepared either entirely or partially by members of the engineering force of the State Department of Health bearing on various phases of work undertaken by the Department. The papers deal for the most part with such subjects as filtration and chlorination of water, quality of water supplies and filters. The studies upon which the papers are based have been carried out almost entirely in the Department, but they contain many features of general interest to engineers and it is these that have been embodied in the bulletin. Although the articles have appeared in the journals of the technical societies or in the engineering press, it was a happy idea to have them published again in one volume, and for this reason and also because of the valuable information contained therein, the bulletin will be welcomed by engineers. We hope that the Department of Health will continue to publish these very interesting bulletins.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Water Waste Survey and Metering In Detroit City

Pitometer Surveys Show Many Underground Leaks and Eliminate Considerable Waste — Systematic Metering Adopted Reduces Water Consumption and Effects Great Saving — Consumption for Various Services

BY GEORGE H. FENKELL

General Manager, Board of Water Comm., Detroit, Mich.

THE INFORMATION that has been gathered on the consumption and waste of water in Detroit is of interest for several reasons:

1. A water works system was installed in Detroit nearly 100 years ago, and pipes laid 80 years ago are still in service.

2. Ninety-eight percent of all active service connections are now metered.

3. A pitometer survey covering the entire city is nearing completion.

4. As Detroit is served with a direct pressure system hourly records of consumption are available.

5. Detroit is the largest city in point of population in the United States, and the writer believes in the world, having nearly all of its connections metered.

6. As the quantity of water available from wells has been negligible, the people of Detroit have been at all times compelled to obtain their entire supply for domestic purposes from the distribution system of the water works.

Description and History

The City of Detroit is located on the north and west side of the Detroit River on land very uniform in contour, the highest point within its limits being 65 ft. above the surface of the river. The water system was installed by a private company in 1827 and in 1836 this was purchased by the city. When Detroit was but a hamlet, the settlers were unable to secure water from wells and were compelled to obtain their supply from the Detroit River, because of the nature of the material underlying Detroit and vicinity. This deposit has a thickness in Detroit of over 100 ft., and is composed of a compact bluish and unstratified clay charged with pebbles and boulders, of glacial origin, and generally impervious to the flow of the water.

Beginning with the first Government census, the population of the city has increased steadily as follows: 1810, 707; 1820, 1442; 1830, 2222; 1840, 9192; 1850, 21,019. From 1850 to the present, the population is shown graphically on the accompanying chart, and estimates recently made place the population at 1,020,700.

While the use of most of the pipe laid prior to 1853 has been discontinued, there still remains some that has been in service eighty years or more, as for example, a section of the 10-in. cast iron pipe in Jefferson Ave., laid in 1839. In 1861, or 60 years ago, the distribution system contained 39 miles of cast iron pipe, and it is estimated that about one-half of this is now in use. At present the distribution system contains 1480 miles of cast iron pipe in sizes from 4 in. to 48 in. in diameter, and 3 miles of 48-in. steel pipe.

In 1886 the use of a reservoir was discontinued,

and since that date the system has been operated as a direct pressure system. The first Venturi meter was set in a discharge main in 1902, and since 1913 all water pumped has been metered at the pumping station, and before 1913 allowance was made for pump slippage. The service connections are of lead and cast iron.

Beginning of Systematic Metering

Systematic metering was begun in 1889, when 194 meters were installed, and by the end of 1890 this number was increased to 856. The accompanying chart shows that approximately 10 percent of all services were metered by 1897, and this ratio of the number of meters to the number of service connections continued fairly steady until 1912.

It will be seen by referring to chart No. 1 that in 1882 the per capita consumption was 120 gals. per day and in 1887 was 209. This phenomenal increase occasioned much discussion for several years. The marked decrease from 1887 to 1891 was due to at least three causes, namely: the use of meters, which were at the time credited with all of the saving, although the number set was small; careful inspection of premises; and the installation of by-passes on the vertical compound double acting pumps. The introduction of these by-passes permitted the capacity of the two 24-mil. gal. pumps to be changed at will to 12-mil. gal. pumps. The by-passes made it possible to eliminate the waste of large quantities of water which were allowed to flow into the suction wells at times when the capacity of these pumps working at minimum speed was greater than needed to supply the city.

In Detroit, general metering was begun in 1913, and on July 1, 1920, 97.4 percent of all active service connections were covered. The greatest number of meters set in any month was 5,345 in October, 1918.

The average water pressure as determined from 39

Chart 1—Average daily consumption in reference to population and effect of metering on water waste.

Chart No. 2—Decrease of consumption as price increases.

pressure gauges generally located in fire engine houses, in various parts of the city and read hourly, is 31.5 lbs., the maximum pressure is 45 lbs., and the minimum pressure is 22 lbs.

Consumption and Waste

The items that enter here may be divided and classified in various ways. A table has been prepared in the way that was most convenient for use in collecting the data, and the following explanations and remarks relate to this table.

In computing the quantities based on meter measurement, an allowance of 5 percent has been made for under-registration of meters. The first item covers 131,692 metered domestic accounts. This number was arrived at by subtracting the number of commercial accounts,

as estimated from a careful examination of the city directory, from the total number of metered accounts where meters were one and one-half inch or smaller.

The water furnished 2,985 domestic flat rate accounts is estimated by allowing one thousand gallons for every five cents of revenue. The meter rate in force is on a quantity basis and is one dollar for the first thousand cu. ft., fifty cents per thousand for the next three thousand cu. ft., and thirty-five cents per thousand for all additional.

On June 10, 1920, there were 164,779 service connections of all sizes in the city, and of these 145,053 were in use. On May 1, 1921, it was estimated that the area covered by the water waste survey contained about four-fifths of the total population of the city. The total number of service leaks found by this survey in this area was 447, wasting 4,359,000 gals. per day, or approximately 10,000 gals. for each service per day. All of the water wasted by the service leaks just mentioned was unmetered. By pitometer measurement 116 of these were found to be wasting 2,704,000 gals. per day, or about 23,300 gals. each. The remaining 331 were small service leaks which were located in connection with the inspection of the houses for leaks and are estimated to have averaged 5,000 gals. per day each.

The population of Detroit in 1920 as determined by the United States census was 993,739, and at present it somewhat exceeds one million. For the purpose of this paper, a population of one million has been used, and it is believed that no serious error has been introduced by the use of this figure.

All services having meters 2 in. or larger are considered to supply factories and other commercial users, 1,219 in all. This number includes some large apartment houses, but it is believed that the error introduced is small.

The number of stores and other commercial accounts which is estimated to be 7,416, was arrived at by an examination of the city directory as previously explained. The water used for building purposes is found by allowing 1,000 gals. for every five cents revenue in the same manner as with the domestic flat rate accounts.

All water supplied to villages and factories outside the

city limits is metered and the number of domestic consumers so supplied is negligible.

A careful estimate shows that 30,644,000 gals. of water were used in extinguishing fires during the year ending June 30, 1917, and it has been assumed in preparing this estimate that there has been an increase of 40 percent since that time in the use of water for this purpose.

Up to May 1, 1921, the Pitometer Company had located, uncovered and stopped leaks in mains amounting to 2,533,000 gals. per day. During the past year there were 75 breaks in mains, and it is estimated that this loss amounted to 32 mil. gals. Of these broken mains, 5 were 24 in. in diameter or larger. Great care has been used by the department in laying large mains, and the following test is mentioned to show the result of careful workmanship and good inspection. In 1909 a section of 48-in. cast iron pipe 14,907 ft. long, containing 1,360 48-in. joints, seven 42-in. joints, two 36-in. joints, and thirty-eight 12-in. joints was tested after closing two 48-in. valves, one 42-in. valve, one 36-in. valve, and fifteen 12-in. valves, by supplying the entire line through a 1-in. meter for a period of 20 hours, and the quantity so supplied amounted to 690 cu. ft. which was at the rate of 258 gals. per hour.

The estimate of the total amount of water furnished for municipal purposes is 17.44 gals. per capita per day, or 12 percent. of the total pumpage, or 13 percent. of the total quantity of water consumed within the city limits. Included in this is 0.39 gals. furnished free to charitable institutions and 0.95 gals. at one-half rate to other charitable institutions. The Department of Water Supply receives no revenue for 12 percent. of the water supplied the city. Flooding trenches is credited with 7 cu. ft. per lineal foot for 200 miles of trench. The estimates for paving, sprinkling, and flushing streets, and for flushing sewers are based on data furnished by the Department of Public Works. Four of the 42 engine houses are metered. The water used in 15 ladder houses is estimated. Five of the eleven police buildings are metered, and the supply of five parks, including Belle Isle, is metered. There are 12 unmetered park fountains, and the Pitometer Company found the average daily consumption for each of these to be 45,000 gals. There are 150 continuous flow sanitary drinking fountains on the streets of the city, each of which is estimated to use 1,100 gals. per day, and 150 horse fountains, each using, as determined by measurement, 15,000 gals. a day.

The Public Welfare Commission during the winter months makes use of eight skating ponds, and it is estimated that each has a capacity of 20,000 cu. ft., and that it is filled four times a season. All of the 14 public libraries are metered, 123 of the 161 public schools are metered and the water used in 75 private schools is estimated. Of 35 other public buildings, 8 are metered. There are 32 charitable institutions receiving free water, and 30 on a half-rate basis, all of which are metered.

The quantity used for flushing mains includes that used for filling new mains and making blow-offs of dead ends,

Chart No. 3—Hourly consumption of water in Detroit and suburbs—Entire system.

This information on the minimum night domestic consumption is meagre and conflicting, and any conclusions drawn from it must be in error to some extent. The amount used in these estimates, 22 gals. per capita, is probably a fair average for Detroit.

Gals. Per Capita

Manufacturing night consumption, metered, covering district including 80% of the population	19.82
Underground leakage, measured, covering same district	8.91
Underground leakage, not measured, 650 miles of mains @ 3,000 gals. per mile	2.41
Public night use, estimated	10.92
Night domestic use, estimated	22.00

Total consumption accounted for 64.09

The minimum night rate furnished 80 percent of the city as measured by pitometer, was \$6.42 gals., and the difference between this amount and the 64.09 gals. accounted for is 22.33 gals.

In an endeavor to secure data on fixture leakage, an examination of the waste survey records was made, and of all of the leaking fixtures examined, the inspector reported the flow for 4,336. The waste was metered in 90 percent of these, and the balance estimated. The waste amounted to 4,238,196 gals. or at the rate of 977 gals. per leaky fixture, with 80 percent of the population included in the district surveyed, 17,597 leaking fixtures were discovered, which at 977 gals. accounts for 17,192,269 gals. per day. This is probably 10 percent below actual leakage, for in many blocks where the night consumption was reasonable, no house to house inspection was made.

When the quantity just mentioned is increased 10 percent, the leaking fixture waste, as determined in this way, amounts to 23.64 gals. per capita, which checks the 22.33 gals. mentioned above.

No way has been found to closely estimate the amount of water lost through domestic carelessness. It is known that hose is allowed to run all summer when families are out of the city, that laundry tub fixtures are frequently kept open for long periods, and that scarcely a day passes but one member of each family allows water to waste needlessly for a few moments, and that in other ways considerable quantities of water are wasted through carelessness. In order to complete this estimate, it will be assumed that each of the 150,000 connections be allowed to waste for 5 minutes each day at the daily rate of 3,000 gals., and this is found to amount to 1.5 gals. per capita.

The estimate of daily consumption will now appear as follows:

Gals. Per Capita

1. To prevent freezing	0.75
2. Lawn sprinkling	0.90
3. Leaks in service connections	5.45
4. Leaks in fixtures	22.33
5. Carelessness	1.50

Total 30.93

The quantity subtracted from the total domestic consumption leaves 25.23 gallons for domestic use.

Metering in Detroit

While the use of meters in Detroit is said to date from the year 1888, the report of the department for 1878 contains an item of \$2,700.00 (estimated) for "Metre-measured water," and in the report of the Board for 1883 the following appears.

The Board is fully aware of the wanton and unjustifiable waste of water both now and for most of the time the Water Works has been in existence. The waste has been much more of late years, for a far better head of water has been furnished than formerly, which has enabled the wasting class to do an increased business. Other cities have the same evil, but no remedy has yet been found and may not be until the fertile brain of some man brings out a cheap and reliable meter."

The few meters and indicators installed prior to 1889

had no appreciable effect on consumption. By referring to the accompanying chart, No. 1, it will be evident that disregarding the increased pumpage between 1883 and 1890, due to waste at the pumping station, there was a fairly uniform increase in the consumption of water from 1850 to 1893 of 3 1/4 gals. per capita per year. Because of variations in temperature and precipitation from year to year, and for other reasons, the consumption line has its ups and downs, but its general direction is well represented by a sloping straight line and if continued would have approximated 247.5 gals. For a few years preceding and following 1890, careful attention was given to house to house inspection, and the effect of this work combined with that of meters and decreased use of water because of an industrial depression, produced a change in the direction of this line.

By 1897 ten percent of all services were metered, and this ratio of metered to unmetered connections continued fairly uniform until 1912. During this period from 1893 to 1913 the use of water increased fairly uniformly at the rate of two-thirds gallons per capita per year, and this line produced indicates that had the policy of metering ten percent of the connections continued, the consumption in 1920 would have amounted to about 177 gallons per capita.

About 1914 the work of metering all consumers was begun, and in 1919 the water waste survey was undertaken with the result that there has been a decided decrease in the consumption of water. The line on the chart No. 1 indicates that from 1916 to 1920 this decrease has amounted to about 5 gallons per capita per year.

Accepting the lines on the chart as reasonable, the consumption in 1920 would have been 248 gals, had no meters been set and had waste been restricted only by house to house inspection; to 177 gallons had the policy of metering ten percent of services been continued; and with all connections metered and with the aid of a water waste survey, the consumption may be expected to approximate 135 gals. per capita.

In a direct pressure system the plant must be capable of supplying water at the maximum hourly rate; and thus the effect of metering on the maximum hourly rate becomes of great importance. The quotient obtained by dividing the maximum hourly pumpage for the year by the average hourly pumpage is given as follows for several years past:

1910	1.73	1915	1.52
1911	1.75	1916	1.51
1912	1.59	1917	1.55
1913	1.75	1918	1.50
1914	1.64	1919	1.63
		1920	1.55

As normal pressures were never maintained during periods of high pumpage previous to the time meters were set in sufficient numbers to lower the pumpage appreciably, it is apparent that the maximum hourly use has been reduced to even a greater extent than the average. That is, that while from 1910 to 1914 inclusive, the maximum hourly rate with low pressures exceeded the average by 70 percent, from 1915 to 1920 inclusive, the maximum hourly rate with pressures nearer normal, exceeded the average by 55 percent. Likewise it can be shown that the increases of the maximum daily consumption over the average daily consumption has been reduced from 44 percent for the period from 1910 to 1914, to 32 percent from 1915 to 1920.

Previous to metering to any extent, a strenuous attempt was made to limit waste by house to house inspection, and this work was continued for some years to an ever lessening degree. As metering increased this inspection work decreased until in 1910 it was negligible. The number of employees required to carry on efficient semi-annual inspection work is but little less than the number needed for quarterly meter reading.

Underground Leaks Stopped by Survey

Consumers have looked on metering with favor and there has been no opposition to the movement from any class.

When the water waste survey was undertaken by the

Pitometer Company in 1919, that company assumed that this work would result in the location and stoppage of at least 20 million gallons per day. This company based its estimate on a consumption of 150 million gals. per day for a population of one million, and on the assumption that the metering of all service connections was automatically controlling domestic waste.

The survey up to May 18 has stopped underground leaks from all causes amounting to about seven million gals. per day. These leaks have been located in an area containing 80 percent of the population, covering 70 percent of the consumption, and including one-half of all the mains in the city. It seems probable that when the survey has been completed 10 million gallons of underground leaks per day will be stopped. This discrepancy between the estimated and actual underground leakage is due to the fact that meters have not eliminated metered leakage through fixtures, although such leakage has been greatly curtailed. The estimated waste existed, but was divided between house waste and underground leaks.

During the last few months a large number of the oldest small meters were removed and tested, and many of the older large meters were tested in place. From this an attempt was made to determine the error in registration, but as the accuracy of a meter that has been in service for some time varies greatly with the flow, it was thought unwise to make use of averages secured from this data. The meters removed included several different makes.

There are several factors that influence the use of water in a city and make it difficult to compare the consumption of one city with another. Chart No. 2 shows that the use of water decreases as the price increases. The figures represent 56 different towns in the United States. The water supply and other conditions in these 56 cities, each with a population exceeding 25,000, vary to such a degree that no law or rule can be found, yet the free-hand line drawn on this chart indicates that a relation exists between rates and quantity used.

Not only does pumping station data show that meters have greatly lessened the use of water for lawn sprinkling, but it is very evident to the observer, and notwithstanding this decreased use, lawns are not generally less green than formerly, for greensward and shrubbery are often injured by the application of too much water.

The amount of water used is also dependent on, (1) temperature in winter; (2) temperature and precipitation in summer; (3) condition of business, that is, whether good times or hard times prevail; (4) the class of people supplied.

Hot, dry summers increase greatly the demand for water for cooling and sprinkling purposes. During cold winters much water is sometimes used to prevent the freezing of service pipes, but when made necessary by such pipes being too near the surface of the ground, the metering of the connections will force the owners to lower these prices. The water department has been called on to lower a number of mains, and many services have been relaid because of the information that has been obtained regarding their depth since meters have been used extensively.

Business conditions affect considerably the amount of metered water used for domestic purposes as well as for factories, railways, hotels, stores and other commercial consumers, while the consumption of such unmetered consumers is much less affected. As the amount of water used depends to some extent on the kind or class of people composing the city's population, it may be expected that the per capita consumption for the past few years would from this cause be increased in Detroit, for the percentage of young men liberally reimbursed for their labor has been exceptionally high.

The rule in Detroit has been for domestic consumers to prepare their plumbing for meter, and for the Board to set and maintain the meters without charge or rental. While the department regulations require meters to be set horizontally, experiments were made to determine the relative wear of meters when set vertically and horizontally by run-

ning meters of seven different makes in test to destruction. The number tested was small, and the results were not conclusive, as the difference was not great.

In May, 1919, the Pitometer Company was employed to conduct a water waste survey of the distribution system of the city. The city was divided into seven sections, and at this date, May, 1921, five of these sections have been completed and about 50% of the sixth section has been surveyed.

Water Waste Survey

The general purpose of this survey was to account for the water supplied to each section; or to reduce the amount by locating and stopping underground leaks in the mains and services. The survey also furnished a check on all industrial consumers for the purpose of discovering unauthorized use of unmetered water, and included a field test of all meters larger than three inches in diameter. Each section was divided into as many districts for individual study as was made convenient by the location and size of the larger mains of the distribution system, and the consumption for a period of 24 hours was obtained by pitometer measurement.

To date 120 districts have been measured and permanent gauging points established in each district for the future control of waste. The area surveyed includes about 80 percent of the population, and 50 percent of the miles of main in the entire city distribution system, consuming 106 million gallons a day, or 132 gals. per day per capita. The total minimum night rate in the districts measured amounts to 69 million gals., or a per capita of 85 gals. per day.

Meters larger than 3 in. in diameter, to the number of 356, have been tested under field conditions, and in many cases an under-registration has been found. These have been repaired, and in consequence the revenue of the department has been increased. So far there have been no cases discovered of the unauthorized use of water, and this satisfactory condition found in the older, more densely populated portions of the city, may be accounted for in part by the metering of many fire lines and the quite careful inspection of the remaining fire lines.

Leaks in mains and hydrants have been found as follows:

	Gals. per day
4 Broken Main	562,000
12 Joint Leaks	861,000
3 Open Blow-offs	800,000
2 Blown Plugs	190,000
3 Valves with bad stuffing box leaks	85,000
2 Defective Fire Hydrants	35,000
	2,533,000
	Gals. per day
Leaks discovered by the survey include the above and 116 service leaks caused by broken pipes, abandoned services, and blown corporation cocks	2,704,000
331 service leaks estimated at 5,000 gals. ea.	1,655,000
Waste by broken mains, etc., ...	2,533,000
	6,892,000
A total of	6,892,000

Caution

In the estimates contained herein, quantities are frequently given to one or two decimal places. It is not the intention to imply from this that the number of gals. of water consumed for various purposes has been determined with great accuracy, for many of the quantities have been found by estimate rather than by measurement. In fact, there is scarcely an item that may not be in error. The reader is also warned against applying the results herein obtained to other cities without giving careful attention to the varying conditions which will be found to exist in Detroit and in the city under consideration.—Paper read at American Water Works Association Convention, Cleveland, June 6-10, 1921.

REPORT OF COMMITTEE ON TOPOGRAPHICAL AND EXPLORATION SURVEYS

Report Presented at the Meeting of the Association of Land Surveyors in Toronto Last Week. Review of Survey Work Undertaken by Committee.

By J. W. Pierce, D.L.S., O.L.S.,
Chairman of the Committee

A NUMBER of surveys that might properly come within the scope of the Committee on Topographical and Exploration Surveys were carried on during the last year at widely scattered locations in the Dominion. A brief reference to the more important and interesting of these would probably be the best means of drawing attention to recent progress in these branches of surveying.

Manitoba-Ontario Boundary

To delineate part of the boundary between the new area added to the provinces of Ontario and Manitoba, about 70 miles of line were run north from Winnipeg river, township 15, during the 1921 season, under the joint auspices of the Dominion and Ontario Governments. The wise policy of defining this line in a permanent and accurate manner, together with the securing of the maximum information on the adjacent country, brought up some interesting points of organization and operation for which there was very little previous data that could be used as a guide.

The supplies were cached in the vicinity of the line during the winter and survey operations were carried on from the early part of June to the middle of October.

The party consisted of twenty-five men, comprising the surveyor in charge, J. W. Pierce, 1st and 2nd assistants, one leveller, one instrument man, one topographer, two rodmen, one front chainman, one cook, one cookee, one head packer, one monument builder, one picketman, seven axemen, four packers and canoeemen. The transportation throughout was man-packing, except where canoes could be used over water routes.

A very accurate method of chaining was used by means of two supporting tripods and chain. On one of these tripods there was a transit for the measurement of slope and alignment while the uniform tension was obtained, using a spring balance and straining bar supplemented by an arrangement of pulleys which when tightened to the proper tension were locked thus making it possible for two men to carry on the operations. The temperature readings were obtained by the use of thermometers. The chain used was compared at intervals with a standard which previously had been compared in the surveys laboratory at Ottawa and corrections determined for its length and sag. A check chainage was made throughout with a three-hundred foot chain with pins, plum bobs, clinometers and thermometers as a check against gross errors.

Levels were run over the line to determine the elevation of the monuments placed and the adjacent summits, depressions, and water levels. In addition to the main line of levels, an independent line of levels was run as a check and an accurate closing obtained over each division before proceeding to the next. Eleven concrete monuments were established on which were placed plates indicating the respective provinces on either side and at points in between these were placed subsidiary brass cap monuments of the type used on Dominion land surveys. In nearly all cases the latter were the short type of post cemented in the rock. These secondary monuments were given prominence by an adjacent rock pyramid, 5 ft. square at the base and 5 ft. high.

The final production of the line was made by a base line transit with sights averaging one and one-half miles. Observations were taken for azimuth usually at two or three-mile intervals and the direction of the line corrected thereby. The line was produced through country almost continuously wooded, and some of the timber being of commercial value. The lakes intersecting the line or close

thereto, were traversed by stadia. A geological party under Dr. Burwash, was attached to collect information for the Ontario Department of Mines on the country adjacent to the line.

Alberta-British Columbia Boundary

The survey of this boundary which has been in progress for some seasons was continued in 1921 under the jurisdiction of the two adjacent provinces and the Dominion. Operations were confined to the mountain sections.

Revision of Section Sheets of Western Canada

During the past few years the Topographical Surveys Branch have, in its program of revising sectional sheets in the West, been collecting and adding a great deal of topographical information to meet the requirements of the industrial, agricultural and tourist interest.

These maps, in addition to showing the regular projection of township outlines, sections and quarter sections, as on the old type of map, have many other items of interest. All roads have been classified, after expert investigation, upon the basis of relative importance as traffic arteries, rather than on a physical condition which is apt to vary widely under seasonal and weather conditions. Trunk roads, for example, as main routes between important but more or less widely separated centres, have been distinguished from secondary roads, often equally good as to physical condition, but limited in importance to the linking up of settlement and as feeders. All buildings, that is, all farm dwellings and other buildings such as churches, schools and blacksmith shops, are shown in accurate location and by special symbols. The whole area is contoured at a fifty foot interval and large wooded areas, telephone lines, mines, etc., are shown. These maps have met with a strong appreciation as reliable information of this kind has been long wanted. The scale of publication is three miles to an inch.

In the field, operations were carried on with a party of six or seven men usually equipped with two touring cars and a truck. Two sub-field parties operated out of each camp with a touring car each and collected information, using the township plans on a scale of forty chains to the inch as a base for sketching and recording the notes.

Supplemented by existing level data, the information on the contours has been largely obtained by aneroid barometers and this work has been developed to a comparatively high degree of accuracy. Control is usually laid down by means of spirit level and stadia level at six mile intervals and the barometers closed on this as far as possible at intervals of time not exceeding one-half to one full hour. Three barometers in each car are read in each case to eliminate erratic deflection on the part of any one instrument. Camp barometers are also read for control during the hours of field work. The results obtained show that the barometric levels have in the large majority of cases closed within ten feet and quite frequently less.

One sectional sheet of about 120 townships is the usual area covered by a party in a season. Relief maps of these areas have been constructed by the same branch in its relief map department and the full topographical information reproduced in colors on the surface with a very fine effect. These models are used by Provincial and Dominion organizations in the study of soil and geological formations, and in dealing with problems of settlement and development such as drainage, irrigation and roads. It is found that a much more realistic and intelligent impression of the ground can be given to laymen, officials and commissioners, by this means than by the contoured map alone.

Mackenzie River Control Traverse

For the purpose of establishing control surveys for the "tying in" of mining claims and oil leases in the Mackenzie valley and to serve as a base map for geological investigations, a stadia traverse of Slave river, part of Great Slave Lake, and the Mackenzie river was carried on extending from the 30th base line to about 100 miles below Norman,

and also about half way up Great Bear river. In this work a separate stadia traverse was made on each bank and ties made from one bank to the other as frequently as possible. Permanent monuments were established at intervals of from two to three miles. Check on the traverse was obtained by observations for latitude and longitude at Resolution, Providence, Simpson and Norman, under the direction of Dr. Klotz of the Dominion Observatory. The total mileage of shore line surveyed amounted to 4,016 miles.

The parties were organized at Edmonton by the Topographical Surveys Branch and went from that city by railroad to the town of Peace River. From this point scows were used, one per party, thus enabling each party to carry their own supplies direct to their work. The only breaks in navigation by this route are at Vermilion Chutes on the Peace river and at Smith portage on the Slave river. At the latter place a 16-mile portage must be made. By getting away from Peace River as early as possible after the break-up of the spring, the parties were able to get forward their supplies across the portage at Vermilion Chutes and arrive at the Smith portage in advance of the first steamers. The early break-up of ice in Great Slave lake last spring permitted the scows to leave Fort Smith several weeks sooner than expected and enabled the various parties to commence their work on the Mackenzie river about two weeks earlier than if they had relied for transport on the regular steamers supplying the northern trading posts. In addition to the advantage of having an independent transport and the time and expense saved thereby, the scows were found very convenient on the actual work, as the cook tent was arranged on the scow and moving camp only required dropping down river with the scow to the point where the working parties would finish in the evening.

Exploration of Northern Saskatchewan

In 1920 the Saskatchewan Provincial Government sent a party to the northern territory of that province for exploration purposes and in the following year, a second party investigated the area with the purpose of making a close study of the features emphasized by the previous year's party in the Bear Hills district. In addition, the south side of Lac la Ronge was examined and the valley of the Muddy river.

The Bear Hills are comparatively unknown, being difficult of access to the traveller. They cover an area of from 60 to 80 miles across the broadest part by from 100 to 120 miles in extreme length.

Shales were observed which may prove to be oil-bearing in character and outcrops of lignite were found which seemed to be of good quality. One mineral somewhat widely found was bog iron ore and this was so plentiful that it would seem to indicate at least that the source from which the ore was derived does not lie far distant and may be developed by more detailed examination.

The timber is somewhat mixed and that of commercial value is widely scattered and only found in small groves. It will be most useful as a local timber supply for incoming settlers.

Topographical Survey of London, Ont.

The Geodetic Survey Branch, Ottawa, during the season 1921 made a topographic survey of part of London, Ont. It included the six more or less distinct operations; precise level net, secondary level net, triangulation net, traverse net, the measuring in of the natural and artificial features to be shown on the map and the locating of the contours showing the configuration of the ground surfaces. Geodetic methods were followed throughout. Four of the thirteen triangulation stations from which observations were made form a quadrilateral of the primary triangulation of Canada. The precise level net consists of forty-one miles of line. Ninety-five permanent bench marks were built and their elevation established.

Stereophotogrammetric Surveying

A new method of photographic surveying, stereophotogrammetric surveying as it is called, has recently been tried out for the first time in America on an extended scale, in

the vicinity of Thirty-one-mile lake district of the Province of Quebec. The only instrumental outfit in Canada at present for this work is owned by the University of Toronto. It was loaned to the Geodetic Survey during the fall of 1920 and the method tested out in a practical way over an area of about one hundred square miles.

In the old method of photo-topography, topographic control points were plotted from photographs taken at widely separated stations from one to ten miles apart. The relief had to be sufficiently varied so that the same points could be recognized in the photograph taken of them from two or more different stations. On the stereophotogrammetric method this is not necessary. Two photographs are taken at the same time by a phototheodolite instrument, one from each end of a short base in such a manner that both are in the same vertical plane. The negatives themselves after development are placed in an instrument called a stereocomparator and the distance and elevation co-ordinates are measured with extreme accuracy. These co-ordinates are then scaled off on a specially prepared plotting board and the position and elevation determined.

When the positions of enough points to control the topography of a certain section have been determined and marked upon the tracing paper by which the plotting board is covered, the tracing paper is removed and the points transferred to the map. Then from an examination of the country from the photographic enlargements and a study of the co-relationship of the points, the contours are shown.

In the annual report of the Superintendent of the Geodetic Survey of Canada to be issued, for the year ending March 31, 1922, it is intended to give a detailed account of the field and office methods and the theory of the field and office instruments in connection with this work.

WILL PREPARE A CITY PLAN FOR MONTREAL

WORK on the preparation of a city plan for Montreal will be started this year according to Chairman Brodeur of the Executive Committee. The extent of a general plan of Montreal may be judged by the fact that it is estimated it would cost from \$600,000 to \$800,000 and would take ten years to complete.

On the other hand a general plan of the Island of Montreal is declared to be a fifteen-year job for a staff of engineers, working all the time taking notes in summer and making the plan in winter at a cost exceeding \$1,000,000.

Such a plan would indicate, for example, the levels and dimensions of streets, and it would also show the correct dimensions of all buildings and blocks of buildings, the measurements, requiring accuracy, would be taken to the one-tenth of an inch. The object of this is that when later the public works department would require the length of a building for one purpose or another they could get the information from the said plan without having to go back to the place and measure it.

Then the street levels and those of sidewalks must be indicated in such a plan as, for example, if a sewer is to be built the department would require to know what are the levels and grades.

This general plan would also indicate the location, the size and dimensions of all sewers, water and gas pipes, and the underground conduits. The advantage of having this information in the office would also be realized when it is proposed to construct a sewer, as the plan would indicate the existing sewers, their size, the street grade and the like.

A. H. Milne, British Trade Commissioner for Canada and Newfoundland, announces that a British firm in competition with American manufacturers has secured a contract with the Provincial Government of Manitoba for the installation of a six-thousand-line automatic telephone exchange for the Fort Rouge district of Winnipeg. The contract amounts to about \$483,000.

OTTERTON AUTO-EDUCTOR

Canadian Company Formed to Manufacture Combination Machine and Otter Municipal Equipment

MUNICIPAL engineers throughout Canada will be interested in the announcement of the formation of the Canadian Municipal Equipment Corporation, Ltd., who intend to manufacture in Canada a line of improved municipal equipment for cleaning streets and catch-basins.

Offices have been established in the Bank of Hamilton Building, Toronto, with Wm. H. Cooke, Toronto, as president and general manager; Geo. W. Otterson, formerly of the Otterson Auto-Eductor Co., of Springfield, Ohio, as consulting engineer; and Charles C. Smith, of Chicago, as automotive expert.

While the company is making arrangements to act as Canadian manufacturers for two well-known lines of American municipal equipment, their main product will be the Otterson auto-eductor, which is a combination street flusher, sprinkler, sprayer, catch-basin cleaner and emergency fire apparatus.

This combination machine will no doubt appeal to many small municipalities which cannot afford to purchase individual machines for each of these operations, but where the town engineer would find a combination machine very useful in keeping his streets and catch basins clean, and as an emergency fire apparatus.

This combination machine has been built in the United States for the past ten years, and is used in all of the large cities throughout that country, and was used in the Government military camps during the war. Mr. Otterson is in possession of some excellent testimonials with regard to the savings effected by its use.

The following are among the work that can be done with the auto-eductor, states the company: Sprinkling and flushing streets and roadways; draining swamps and flooded lands; cleaning latrines, cess-pools and dry-wells; cleaning catch-basins and sand-catchers in city sewers; flushing and blowing out sewers; caisson pumping; salvaging flooded materials; emergency fire protection; hauling water for

The method formerly used in most cities for cleaning catch-basins was to equip men with long-handled shovels, with which they spooned out the detritus and piled it in the gutters until collected by a wagon. This unsightly, unsanitary and offensive system is entirely eliminated by the auto-eductor. Within a few minutes after this machine has run alongside the catch-basin, the detritus has been pumped

AUTO-EDUCTOR WITH PIPING TELESCOPED—READY TO TRAVEL

from the basin to the closed bed of the auto-eductor, and the basin is thoroughly flushed and cleaned.

Although all new auto-eductors will be mounted on the company's standard chassis, if a municipality already owns a chassis, it can be fitted with the necessary equipment. The high customs duty has previously prevented the sale of many auto-eductors in Canada, says Mr. Cooke, but now that the Canadian patents have been purchased by a Canadian firm and the machine will be manufactured in Toronto, he expects to be able to place the auto-eductor within the reach of even the smallest municipalities.

The auto-eductor consists of the following parts, mounted on a five-ton chassis: (1) The body, (2) a hydraulic hoist for raising and lowering the body, (3) eductor (with its connections), (4) centrifugal pump.

The body is designed to separate the solid matter removed from the catch-basin, cess-pool or sump, from the water which has carried it to the body. The separation is accomplished by three sheet-steel baffle plates, one of which is a screen. The baffle plates and screen are located at regular intervals from the front to the rear of the body. Each baffle has a properly proportioned opening, these openings being on alternative sides of the body. The screen, which is located between the front of the body and the first baffle plate, is of the same material as the baffle plates, and the greater part of its area is perforated with closely spaced $\frac{3}{4}$ -in. holes. The baffle plates and screen are hinged on substantial steel rods which extend across the body. These plates swing freely and do not in any way obstruct the passage of the contents of the body when dumping. The baffle plates and screen are removable.

At the front and on the bottom of the body is an outlet which is connected to the suction of the pump. This outlet is controlled by a quick opening and closing valve located just under the body in front and at the right-hand side, forming a connection between the body and the upper half of the suction coupling. A similar valve is connected just aft of the suction-connection coupling cross-connection. This valve is known as the "over-flow valve," and as the solids replace the water in the body, this allows the excess water to flow into the catch basin, cess-pool or sump, through a pipe provided for this purpose.

The rear of the body is closed by a tail-gate hinged at the top. It is made water-tight by means of a rubber gasket. The gate is held firmly against the gasket by means of swivel clamp. A standard dump-body tail-gate clamp which is operated from the front end of the body, holds the gate closed after the swivel clamps have been loosened and swung clear of the gate. This prevents the operator

OTTERTON AUTO-EDUCTOR CLEANING CATCH-BASIN

road construction and other purposes; hauling sand, gravel or other supplies; draining flooded pits or trenches; or any other miscellaneous pumping or hydraulic work required by a municipal engineer or contractor.

Considerable economy is shown by the auto-eductor in cleaning catch-basins, as from sixty to eighty basins can be cleaned in one day. These auto-eductors are now working in various cities, cleaning basins from six to sixty feet in depth.

from being deluged with mud and water when he loosens the swivel clamps preparatory to dumping. The body is provided with splash plates on and across the top at front, sides and rear, which prevent the water from spilling while the machine is in motion.

The body is raised for dumping by a vertical hydraulic hoist. The operation of this hoist is easily controlled by the driver from his seat.

The eductor, or the ejector device, consists of a small casting in which is created a suction by the pump pressure, which draws the contents of the catch-basin, cess-pool or sump through an opening in the side. This refuse is then elevated and discharged into the body. The pressure is transmitted from the pump to the eductor through a length of hose, a short piece of iron pipe, and a return bend, to which the eductor is attached. The hose is used to give flexibility when working at various depths. The refuse is discharged from the eductor through a 3-in. tube which telescopes inside of a 4-in. tube. This allows the eductor to work at any depth from the street level to the bottom of the catch-basin. A small winch is provided on the side of the body for raising and lowering the eductor and its piping.

The entire eductor assembly is hung from a sliding arm, which permits of its operation in catch-basins at various distances from the curb. The eductor and piping, when telescoped, will clear any and all obstructions while proceeding along the street.

For the purpose of breaking up the material in the catch-basin, an agitator is attached to the pump. This consists of a length of small hose to which is connected a length of $\frac{3}{4}$ -in. pipe. The flow of water is controlled by a quick opening and closing valve located at the pump.

The pump which supplies the pressure for operating the eductor is of the centrifugal type. It has been specially designed to overcome all difficulties in this class of service that have been discovered in the experience of the Otterson Auto-Eductor Co. with hydraulic ejectors. The pump is driven by the truck motor through a specially designed transmission and is controlled by the driver from his seat. A pressure is connected to the pump in view of the driver, which enables him to control the motor speed to maintain the proper pressure at all times.

In addition to the standard Otterson auto-eductor described above, the company intends to build a special heavy-duty type of eductor for use where the lift is greater than 15 ft. This heavy-duty type is similar in body equipment to the standard type. The pump is double stage and of the same design as the single stage used on the standard auto-eductor. This pump gives the increased pressure required in working to greater depths. The eductor and connections are designed to meet the demands of this duty.

O. L. S. ANNUAL MEETING

More Than One Hundred Surveyors Attend Interesting Three-Day Convention in Toronto

COMMENCING Tuesday, February 21, and continuing for three days, the thirtieth annual meeting of the Association of Ontario Land Surveyors was held in the lecture room of the Engineers' Club, Toronto. The attendance averaged over one hundred members.

The general session opened at 2 p.m., Tuesday, with the reading of the minutes of the previous meeting, after which Geo. A. McCubbin, of Chatham, delivered the annual presidential address. He reviewed the affairs of the association for the past year in a general manner, and emphasized the need for precision in engineering work under all circumstances.

The report of the Committee on Land Surveying, which consisted chiefly of answers to questions as to methods in regard to special problems, was presented by E. T. Wilkie, H. T. Routly, Toronto, read a paper on "The Development of Townsites in Northern Ontario." H. L. Seymour, chairman of the Committee on Town Planning, presented the report of that committee.

The Tuesday evening session proved to be decidedly interesting. H. K. Wicksteed, of Toronto, described the system of transportation for both railroads and highways of Venezuela. He showed many excellent lantern slides.

Following Mr. Wicksteed's address, E. V. Seibert, of Ottawa, delivered an illustrated lecture on "Mackenzie River Work," which followed the same general lines as Mr. Wicksteed's lecture, thus providing an interesting comparison between railroad and highway transportation in the South and the North.

Wednesday morning's meeting was opened with the reading of the report of the Council of Management and Board of Examiners by T. B. Speight. The report of the Committee on Engineering, Roads and Pavements was presented by T. M. Empey. J. W. Pierce, chairman of the committee on Topographical and Exploration Surveys, read the report of that committee, outlining the work accomplished during the year throughout the Dominion. James Dickson, completed the session with an interesting paper on plans and descriptions for registration of subdivisions.

J. J. Newman, chairman of the Committee on Drainage, opened the session on Wednesday afternoon by presenting the report of that committee. He dealt chiefly with the methods of working under the Municipal Drainage Act in Western Ontario. This report was followed by papers on "Assessment for Tile Drains," by F. J. Ure, and "The Essex Border Utilities Intercepting Sewer," by M. E. Brian. Willis Chipman, chairman of the Committee on Biography, provided an interesting half-hour with the history and biographical sketches of pioneer surveyors of Ontario.

Among the guests at the annual dinner held in the club's dining room on Wednesday evening were the Hon. Beniah Bowman, Minister of Lands and Forests of Ontario; G. F. Henderson, K.C., drainage referee; F. V. Seibert, a past president of the Dominion Land Surveyors' Association; A. V. Hall, president of the Town Planning Association, Toronto; and Major A. W. Gray, M.P.P., who introduced the bill in the Ontario Legislature respecting the regulation and licensing of professional engineers.

The election of officers for 1922 took place on Thursday morning, resulting in the selection of the following:

President, Geo. Hogarth; vice-president, H. T. Routly; Secretary-Treasurer, L. V. Rorke (re-elected). Members nominated for the Council of Management, to be voted on by letter ballot, are W. G. McGeorge, Chatham; E. T. Wilkie, Toronto; J. M. Watson, Orillia; H. M. Anderson, North Bay; John M. Empey, St. Mary's; F. N. Rutherford, St. Catharines; and N. B. MacRostie, Ottawa.

The usual "Veterans' Luncheon" was held at noon, Thursday. This function, which was exclusively for surveyors who received their certificates prior to 1891 and all past-presidents of the association, concluded what was unanimously conceded to have been the most enthusiastic gathering of surveyors that has been held in Ontario for many years.

During the year ending March 31, 1921, the shipping constructed in Canada amounted to 95,838 tons. During the year ending March 31, 1920, 164,074 tons of shipping was built. During 1921, 34,623 tons of shipping with a value of \$8,456,573 was sold to other countries. In 1920 the tonnage sold to other countries was 53,407. The value was \$17,819,477. In 1868, the first year for which statistics are given, 87,230 tons of shipping was constructed in Canada. This industry reached its highest peak in 1875, when 188,098 tons reached the ocean. From 1875 tonnage constructed each year gradually declined until in 1896 only 10,753 tons passed from Canadian yards. After 1896 the amount increased until another peak was reached in 1920. In 1918, 53,912 tons of shipping was constructed, and the figures given show that this more than doubled in 1919 and more than tripled in 1920. Of the total of 220 vessels built in the fiscal year ending March 31, 1921, 139 were steamers and 81 sailing vessels. The steamer tonnage was 80,174 and the sailing vessel tonnage 15,664.

THE DEVELOPMENT OF TOWNSITES IN NEW ONTARIO

Haphazard Growth of Towns in New Ontario — Ordered Development Essential — Suggestion that Ontario Land Surveyors Should Advise on Town Planning

By H. T. Routley,
Contractor, Toronto

THE PAST history forming the basis for this paper is that of the district opened up by the T. & N. O. Ry., particularly the portion from Temagami to Cochrane and including the mining areas of Cobalt, Montreal River, Gowanda, Larder Lake, Swastika, Porcupine, etc., with the various towns, villages and camps located therein. Though not as familiar with the balance of the province lying westward to the boundary of Manitoba, I am sure that the conditions and problems in the settled portions of this area have been very similar. And the problems of the past with the lessons learned are applicable to all that great area, the very heart and centre of the future Canada, and now but indifferently understood and appreciated under the title of North or New Ontario. There are but few who have any real conception of the vastness of this area; of the unbounded wealth of its mines, forests, streams and agricultural areas. This great area situated as it is in the very heart of our Dominion, is destined, at no very distant future, to occupy a position of commanding importance in the political and commercial life of our country. I feel, therefore, that no apology is necessary in presenting to you one of the problems, not only of its past, but one of the greatest of the problems of its future, and one on which this Association is peculiarly qualified to consider and advise.

Progress of Development in New Ontario

During the years of 1910, 1911 and 1912 public men in the North and to some extent also in older Ontario, were becoming much concerned and were giving a great deal of thought and study to the question of the development of new townsites. These had been springing up all over the district, due principally to the discovery of new mining fields, and it was felt that some efficient system of control and guidance should be inaugurated, especially during the early period before incorporation. The local Boards of Trade were very much alive to the mistakes of the past and the necessity and possibility of avoiding many of them in the future. At most of the meetings the townsites problem was raised and discussed in some form or other. It was felt that the repeated devastations by fire and typhoid fever especially, were amenable to control or entirely preventable. Many phases of the question were discussed, not always with unanimity of opinion, as to causes or cures. It was sometimes difficult to keep the discussion within bounds, as political bias frequently influenced the arguments pro and con. There were salient points however on which agreement was practically unanimous and some of these were crystallized in the form of a resolution by the Halleybury Board of Trade in 1911. After much discussion this resolution was adopted by the local Board. It was then submitted to the Associated Boards of Trade of Temiskaming where it received hearty approval, and was then included in the agenda of the Ontario Associated Boards of Trade meeting in Toronto in Feb. 1912. At this meeting there were many other problems from New Ontario, all of which were of direct and immediate interest to the particular town or district initiating them, and the Townsites Resolution, not being strongly championed, received only partial endorsement at the hands of the Ontario Associated Boards of Trade. It was not rejected, but after some discussion was referred with others to the Executive Committee for further examination, consideration and action. Certain new or altered regulations respecting for example, the clearing of timber around townsites and the appointment of district medical officers would indicate that the agitation back of the resolution has since borne some fruit.

Since that time however there have been very few townsites started and the question has lain in abeyance.

The time is again at hand however when we may expect and should prepare for the development of numerous mining camps and unorganized hamlets, many of which will later develop into fair sized villages or towns, and some no doubt within a generation or two will have developed into cities. Now is the time to lay the foundations right and to start all these potential towns and cities on proper lines so as to eliminate the early dangers and also avoid many of the problems which beset our present towns, both in New and Older Ontario, because of a lack of foresight and intelligent control at their inception. It should be feasible to so guide and protect these embryo towns that they may escape the disastrous fires and epidemics, the gross errors of location and planning, the financial excesses and the many other preventable errors which have waylaid the infant cities of the past. It was this desire and feeling of responsibility to the future which moved these men of the Boards of Trade and compelled them to ponder these problems and to endeavor to find remedies. For the most part, specific details were attacked individually and a solution sought. After much time, discussion and thought, however, it had gradually become to be recognized that the various problems were all part of one main problem — The Development of New Townsites — and there had developed a public feeling that this problem should be taken hold of in a real way by competent men and given the attention and study it deserved. However, about this time, 1913, there came a period of depression followed by the war, causing a practical suspension in the opening up or development of new areas, and diverting men's minds from many of the problems which had previously occupied their attention. It was just prior to this stage of depression that the resolution, previously referred to, was considered and as it represents pretty fully and fairly the stage at which public opinion had arrived at that time, I beg leave to quote it in full.

The Townsites Resolution of 1912

"Whereas many portions of New Ontario have been proven to be rich in mineral deposits;

"And whereas an army of prospectors is continually in the field prospecting for new areas;

"And whereas it has occurred in the past and is likely to occur very many times in the future, the rush settlements which later may develop into towns and cities spring up in the vicinity of newly discovered rich mining areas;

"And whereas in the past due to lack of municipal organization, provincial or other control, these new settlements have frequently been located on unsuitable ground and built without regard to the proper allowance for lanes, streets, etc.;

"And whereas until such time as the town grows in permanent population and becomes incorporated, there has in the past been exercised no proper and sufficient control of the sanitary conditions; of the clearing and building arrangements with a view to the prevention of fires; of the arrangements for the disposal of garbage and other waste material; of the arrangements for the protection of wells, springs or other sources of water supply; and of many other functions pertaining to organized municipalities;

"And whereas the lack of such supervision and control in the earlier stages in the formation of many of the New Ontario towns has been the direct cause of serious loss by fire and serious outbreaks of typhoid fever,

"And whereas such loss by fire and epidemic is a serious and unnecessary setback to the new towns and is a loss not only to the individual camps in which they occur, but directly and indirectly to the whole Province of Ontario;

"Be it therefore resolved that the Ontario Associated Boards of Trade do hereby urge upon the Government the serious needs of instituting some plan of control of the clearing and building operations, of the street planning, of the garbage disposal, of the water supply and such other municipal functions as are necessary until such time as the municipalities become incorporated;

"That the deforestation of townsites be enforced before the sale of any part of such townsite be permitted."

As indicated by the wording of the resolution, those most familiar with the problem felt that the critical and dangerous period was in the early stages before incorporation. During that period about the only influence for good in the layout of the town was the consciousness of responsibility to the future population on the part of the surveyor employed. But since he had no real authority to control the location or layout, he was limited to the friendly tender of advice and suggestions to his clients. Indeed in many cases even this influence was missing, as several of the towns were first staked out by squatters without any surveyed subdivision or plan.

How Townsites Are Formed in New Ontario

Let me sketch the typical history of the formation of a New Ontario townsite. On the location of a rich mineral find, a rush of prospectors would stake out the surrounding country. If the discovery gave early evidence of developing into an important mine, a townsite was an immediate requirement. Stores, stopping places, amusement halls, offices of various kinds and residences would spring up as if by magic, and in a very few weeks a fair sized town was the result. The buildings were of log, frame or canvas with various combinations of these three materials, and were usually overcrowded and entirely lacking in fire protection. As soon as an embryo town was well started, real estate operators secured and subdivided nearby rival sites, with the result that there were usually three or four separate settlements closely related, but all in keen rivalry. Owing to this dissipation of the population and the uncertainty as to which section would eventually win out and be the real town, the whole population was compelled to do without waterworks, sewage and garbage disposal, fire prevention and other primary requisites of civic life, many of which would have been readily obtainable had the population been centered at one point and able to combine their resources to the best advantage. And the survival of the fittest is not always the outcome. The best natural location may lose out because an inferior one is supported by a more aggressive and influential group of men. The result may be that a community is permanently fixed on a site which is topographically, geographically and economically much inferior to a nearby site, which might just as well have been chosen, and the community is for all time unnecessarily handicapped by its location and the misguided ardor of its first supporters. And throughout its entire history, the inhabitants may have to suffer grievous burdens simply owing to the lack of proper control and guidance during the early history of the settlement. Repeated visitation by fire has been the lot, almost without exception, and typhoid has taken bitter toll in the majority of the present towns. Such has been the history of the past. Some improvements have been inaugurated, especially with regard to typhoid, but much remains still to be done before new towns will be off to an ideal start.

T. & N. O. Ry. Commission Usually Controls Townsites

Do not infer that there is no controlling agency or organization of any kind. This would be hardly correct. In the towns located on the T. & N. O. Ry., the Railway Commission usually controls the townsite by having acquired the farm lots from the Crown before any settlement has started. A portion of the land acquired is subdivided and lots advertised for sale. These, however, are often grabbed up by speculators to the loss and detriment of the real settler and the town as a whole. There is also a measure of control of other townsites, in that a subdivision plan must be submitted to the Department of Lands and Forests for approval, and to give the Government an opportunity to choose from the proposed plan one-quarter of all the lots, as per the "Act respecting Townsites" 10 Edw. VII, Chapter 9, passed in 1910. Much objection has always been felt in the North not so much to the spirit of the Act itself, but to the method of its application. The lots so chosen and also the lots retained or owned by the T. & N. O. Railway Commission, in their townsites, are removed from tax-

ation, and constitute a continuing source of annoyance and complaint, being an irritating burden on the balance of the town, which must tax itself so much heavier to make up for the lack of taxation on the lands so held waiting for the increment earned by the patience and industry of the people who make the town. It has been felt that a better plan of dealing with the Government's lots could be instituted and the question of setting aside the revenues obtained, to be used for the benefit of the town treasury, has often been suggested. These are questions worthy of study, and on which a definite policy should be laid down after thorough investigation and mature consideration.

It has been held in the past that the Railway Commission was the best body to choose, lay out and administer the new townsites along this line. There is no doubt that, in their power to limit the available building lots and so force a greater concentration of population, their control was an improvement on the haphazard and widespread subdivisions of many of the other townsites. I hold, however, and I believe the great majority of people in New Ontario will agree, that the Railway Commission is not now the proper body to control the townsites even along its own lines. It is essentially a railway construction and operation organization, and there are always questions arising between any railway and the towns through which it runs, that involve differences of opinion and policy, and where the interests of the two are sometimes much opposed. It is only reasonable to suppose that a railway commission will foresee as far as possible its railway requirements of the present and of the future, and will take care to secure for its railway, what it requires or thinks it may ever hereafter require, and the interests of the future town or city will of necessity take secondary place. I am not criticizing the personnel, past or present, of the T. & N. O. Railway Commission, for I believe that they have been very conscientious in their dealings with the various towns through which the line runs. But they are a railway commission, and it is undeniable that their first duty is to the railway. Nor is it possible for the regular staff, of an already well burdened department of the Government, to give the question the close attention, the detailed study, the personal visitation and supervision which is necessary to arrive at the best conclusions. A well thought out general policy is necessary but after that there will be frequent propositions requiring prompt and careful study and inspection so as to arrive quickly at a decision backed by thorough investigation and careful, intelligent analysis. Speedy action is most essential as will be recognized by those who were present at the birth of Gowanda, Elk Lake, Timmins and many other New Ontario towns, and this quick action can seldom be taken by a government department, especially where it is not directly organized for, and charged with the duty of such supervision.

Great Field for Town Planner

In the early days, perhaps no other methods were possible or justifiable, but the requirements have long since grown to such magnitude, and the possibilities and responsibilities of the future are so great, that no further time should be lost in planning and putting into effect a proper organization for the control and guidance of the scores of new towns which the next generation will undoubtedly scatter through New Ontario. It is a work justifying the employment of the greatest experts in this line of work. No greater field of opportunity has ever been offered to the town planning expert and civic economist in this country. It is more than an opportunity, it is a sacred duty and responsibility confronting those whose eyes have been opened, and whose minds have been trained to see the need and feel the responsibility for the unborn towns of this great area. To those of you who know the North, there is no need to prophesy the birth of new communities. We can hear the sound of many hammers as the shacks spring up like a bed of mushrooms, and soon there will be the songs and laughter of many children. Shall the coming generation have no benefit from those who have so recently

gone before, and learned the hard lessons of the pioneer. Must they also learn from their own hard experiences all these lessons over again, or shall we turn and pause long enough to help guide them past these early pitfalls. There is no body of men better qualified by experience, sympathy and sense of responsibility than the Association of Ontario Land Surveyors, to consider the problem and to advise intelligently regarding its solution. There are those of our members who have given much time and thought to the question of town planning in its various phases, particularly as applied to the alteration of established communities, for the correction of past errors, most of which can be avoided, and at negligible cost in the lay-out of new towns. The problem of the development of new townsites in Northern Ontario is worthy of their attention; worthy of the attention of the biggest and brainiest men in many of the allied professions, the sanitary experts in the study of water supply and the disposal of waste; the medical health authorities in the study of the provisions for guarding and improving public health; the municipal finance experts in devising ways of providing the new towns at the earliest possible period, with the various civic necessities while protecting them from the over optimistic squanderer of public funds; the foremost educational authorities in planning for the future school population; the municipal legal experts in guarding them from piratical public service corporations. The best of what has already been learned in the older towns of the North, and of older Ontario should be accumulated, studied and applied as far as may be possible for the benefit of these towns yet to be.—Paper read at the Thirteenth Annual Meeting of the Association of Ontario Land Surveyors, Toronto, February 21-23, 1922.

SHORT COURSE IN WATER POWER DEVELOPMENT

LAST week's issue of "The Canadian Engineer" contained a short notice of the above-mentioned course and we are now able to give full details regarding this series of lectures. The lectures are to be given in room 22 of the Mining Building on College Street, University of Toronto, and have been arranged by the hydraulic section of the Department of Mechanical Engineering of the University of Toronto. Lectures are to begin each afternoon at 4:30 sharp. The lecture on Monday on "Hydraulic Turbines and Installation," was given by Lewis F. Moody, who is well acquainted with turbine design and kindred subjects. Mr. Moody is a graduate of the University of Pennsylvania, later a professor of Hydraulic Engineering in the Rensselaer Polytechnic Institute and is now consulting engineer with the L. P. Morris Co., Philadelphia, who are among the largest builders of hydraulic machinery in the world.

The lecture on Tuesday was given by Max V. Sauer, on "Hydraulic Equipment as Affecting Power House Design." Mr. Sauer is a graduate of the University of Toronto following which he spent some time on the University teaching staff. During the past twenty years he has been engaged in practical work with the Ontario Power Co., the Winnipeg Aqueduct and at present holds the position of hydraulic engineer of design with the Ontario Hydro-Electric Power Commission, having been in charge of the power houses on the Commission at Chippawa, Nipigon and other places.

On March 2 the subject of the lecture is "The Design of Power Canals, Headworks and Surge Tanks," the lecturer being Thomas H. Hogg, who graduated from the University of Toronto in 1907. Mr. Hogg has been connected with the power plants of Niagara Falls for a good many years. Subsequent to his connection with the Ontario Power Co. he was editor of "The Canadian Engineer" for three years, leaving that position to join the staff of the Hydro-Electric Power Commission of Ontario as associate hydraulic engineer and in that connection has played a prominent part in the design of all their plants including the Chippawa project.

On March 3, W. M. White, chief hydraulic engineer, of the Allis-Chalmers Co., Milwaukee, will deliver a lecture

on "Power House Machinery." Mr. White's name is a household word among those who are concerned with the design, construction and operation of this class of machinery, and his experience covers a great many years.

On March 6 at 4:30 p.m. Norman R. Gibson will speak on "Regulations and Testing of Hydro-Electric Machinery" and at 8:00 p.m. that same day he will deliver a lecture on "Some Economic Aspects of Hydro-Electric Power Development." Mr. Gibson, like Messrs. Hogg and Sauer, is a graduate of the University of Toronto and since leaving college has spent his entire engineering experience in water power developments in Ontario, Manitoba and Niagara Falls on both sides of the river. His name is well-known among hydraulic engineers throughout America.

The purpose of this symposium outlined above is particularly to bring the student into direct contact with the engineers responsible for the great hydraulic developments in America and to supplement the course in water power engineering and hydraulics now given and to give students a somewhat broader vision. This course will be of value to such men and it is hoped that a great many students will take advantage of it.

The University of Toronto is fortunate in securing a number of the most prominent engineers in America to give a brief course of lectures to students, and others interested, on the utilization of the vast water powers of this country. Five engineers are contributing to this lecture course, and each of them will deal with a phase of the subject in which he specializes, so that the whole field of water-power engineering will be treated from the viewpoint of the expert.

The University is giving regular courses in water power development and conservation at the present time, and has done so for many years, numbering amongst its graduates men who have become noted in this field of engineering. The present series will, therefore, supplement the regular courses and will bring the University into closer contact with the men who are responsible for the engineering work of the greatest water powers in America, and therefore the greatest in the world.

NEPTUNE METER CO., LIMITED, TO EXTEND TORONTO PLANT

WILLIAM H. RANDALL, managing director of the Neptune Meter Co., Ltd., Toronto, returned home recently after a trip to New York, where he placed orders for some special machinery with the object of extending the company's plant at 1197 King St. West, Toronto. For the past two years practically all of the company's standard makes of meters of the sizes that are usually in demand by Canadian municipalities have been manufactured in Toronto, but the large meters and all special types have been imported from the Neptune Meter Company's plant in the United States. "The object of the proposed extensions," says Mr. Randall, "is to enable the Canadian company to make practically all sizes and types for which there is likely to be any demand in Canada."

TOWN PLANNING BOARD FOR MONTREAL

IT IS probable that the Montreal City Council will appoint a town planning board which will be entrusted with the work of elaborating all projects which may tend to embellish the city such as the opening of boulevards. The city engineer declares that the board shall consist of five members, two of whom shall be the director of departments and the director of public works. The three other members shall be chosen from among the citizens and shall be appointed by a resolution of the council. A by-law will be adopted defining the powers of the board. The city charter further declares it shall also be the duty of the board to make to the council, without being requested to do so, any suggestion or recommendation it may deem useful or necessary in connection with the improvement of the city.

RAIL-CARBON STEEL DISCUSSED AT TORONTO BRANCH, E.I.C.

ONE of the most informing discussions held this season at the Toronto Branch of the Engineering Institute of Canada occurred on Thursday, February 16, when the subject of rail-carbon steel was presented by J. B. Carswell of the Carswell Construction Co., and discussed by the members. Mr. Carswell has recently had occasion to investigate the suitability of this material for concrete reinforcement, and presented the results of his inquiry to the meeting for its consideration in an illustrated address.

In the paper which will appear in an early issue of "The Canadian Engineer," the speaker took particular care to point out that this form of reinforcement is not properly re-rolled steel, but is rather reinforcement steel with a carbon content such as is found in railroad rails subjected to a continuation of the rolling that has already been given in rail manufacture.

In the discussion which followed Mr. Carswell's address, J. M. Oxley asked for further information concerning the origin of the rails and whether there was any certainty concerning the nature of the material that was being used. He cited a case where rail-carbon steel had been found very unsatisfactory and on inquiry had proved to be made from munition discards. He also knew of a case, some twenty years ago, where a railway company had rejected about 5,000 tons of rails as containing too high a phosphorus content and had often wondered whether such material might not have found its way into the manufacture of rail-carbon bars.

Effect of Brittleness

Mr. Oxley inquired as to whether cracking in rail-carbon bars due to brittleness would necessarily be followed by an immediate break. He thought that the bar might hold together for some time, as for example, a glass rod sometimes does after cracking, and later on rupture in the structure. He also wished to know the maximum and minimum variation from the average of the ninety tests of rail-carbon steel taken at random from the records of the rail steel mill. He thought that where but one test per ten tons of finished product, as required by the American Society for Testing Materials, was made, it might easily cover rails from more than one source and the single test might not disclose all possible defective material. He thought that the provision in the A. S. T. M. specification for a re-test in certain cases should be revised.

O. W. Ellis, of the Department of Metallurgy of the University of Toronto, stated that it was well known that segregation occurred chiefly in the centre of an ingot, which meant that when the ingot was rolled to a rail, the segregation would tend to occur principally at the base of the head. Rods rolled from the rail head would consequently contain most of the defective material, according to the speaker.

T. D. Mylrea on the whole substantiated Mr. Carswell's views with respect to rail-carbon steel. He cited the case of the behavior of steel in the damaging of concrete ships as an evidence of the cushioning effect of concrete. While a hole might be punched through the ship and the concrete shattered completely, the reinforcement rods were not broken. High carbon steel rods might consequently be used in such situations with safety.

R. O. Wynne-Roberts pointed out that in recent years the tendency has been to roll more open-hearth rails and that consequently the rail carbon steel industry will be using more material of that grade. He wished to know of the speaker what the effect on the output would be of this development in rail manufacture.

Ensuring Suitable Material

Mr. Carswell, in replying to the questions asked, stated that in the case of large orders for rail-carbon steel the purchaser could definitely ascertain the source of the rails used in filling this order. The inspection company could at

any time furnish information concerning the material, if necessary, and it would be possible to select certain definite types of rail to fill an order if such were absolutely necessary, although this would entail a great deal of extra work, and would add to the expense. The mills, he stated, turned over their yard output in a few months, and considering that railways renew their rails on an average every eleven years, it meant that the supply of rail-carbon steel at any time came from a rail rolled originally about twelve years previous. This would give, said Mr. Carswell, a rough guide to the type and composition of the rails used for the manufacture of the bars for a particular order.

The speaker stated that unfortunately a considerable quantity of munition discard material had been used in war time by the rail-carbon steel industry by special arrangement and with a view to helping out the economic situation. It had admittedly resulted in an unsatisfactory product and it was regrettable that such a step had ever been taken. It was hoped that the occasion for so doing would never arise again.

Referring to the 5,000 tons of rails rejected for high phosphorus content mentioned by Mr. Oxley, Mr. Carswell expressed the view that the use of such a large quantity of objectionable materials was not likely to occur in the rail-carbon steel industry of these days. He agreed that a single test for each ten tons of material did not seem enough and that the provisions for re-test should be revised.

Replying to Mr. Oxley concerning variations from the average tests, Mr. Carswell stated that the highest ultimate strength for the ninety tests of which reference had been made, was 109,000 lb. per sq. in. and the lowest 51,000 lb. per sq. in. Probably 90% of the test results ranged from 55,000 to 70,000 lb. per sq. in. The large sizes of bars, said the speaker, admittedly showed a drop in strength of about 7 or 8%. Consequently the manufacturers do not roll bars as a rule above about 1½ in. diameter.

Segregation

Mr. Carswell stated that when segregation occurred it was always worst at the end of the rail as rolled, or of the rods as completed, and the tests were always made on the first section cut from the end. If this showed defects, it was scrapped and the second section cut was tested, and so on until a point was reached where the rod was free from segregation or other defects. If cases of segregation eluded inspection, they would, if at all serious, show up in the rolls, for defective rails will jam the rolls and split. If it were not serious enough for that, then the amount of segregation in the final rod cross-section would be proportionately the same as that in the rail head, due to the nature of the rolling operation.

The speaker did not regard the increasing proportion of open-hearth rails as an argument against the rail-carbon steel industry. Such rails have been rolled for years with satisfactory results, and the high quality of the material undoubtedly results in satisfactory reinforcement bars.

Figures to show that the entire cost of the proposed international St. Lawrence waterway and power project could be defrayed by sales of electric current at prices cheaper than those at which current can be obtained at Niagara Falls, were presented by Henry L. Harriman, president of the New England Power Company, in an address recently before the Water Power League of America.

Messrs. Royce, Ltd., engineers of Trafford Park, Manchester, England, have received an order from Messrs. Braithwaite & Co. of West Bromwich and Newport, Mon., for the full equipment of 11 electrical overhead travelling cranes for workshops which Messrs. Braithwaite are erecting at Bombay, India. The workshops are being built in connection with a large order which the Braithwaite Company has secured for steel pipe 6 ft. in diameter and 114 miles long for supplying water to the city of Bombay.

QUEENSTON-CHIPPAWA POWER DEVELOPMENT COSTS

APART from the hydro-radial issue, the chief matter of contention between the Ontario Government and the Hydro-Electric Power Commission appears to be the alleged excessive cost of the Chippawa development. It has not been represented, so far as we have been able to learn, that the work now partially completed are extravagant in character for the service demanded of them, or that they are needlessly permanent or that these structures, plant and equipment are not as simple and economical as sound engineering principles would require them to be in the circumstances. In all the criticism of the "Hydro" that has been voiced in Ontario, no one has been able to say that the engineering work, both in a large directive way and in detail, has not been entirely commendable. In our judgment, no more capable or loyal engineering organization was ever charged with a large project in this country.

The truth of the matter is that the Government with one eye on its precarious majority in the House and the other on the somewhat depressing financial situation in the province, has little desire to court unpopularity by effort to raise on its own responsibility further large sums for Hydro activities. It harbors a feeling, as Hydro critics in general do, that the Chippawa development is costing a lot of money, more by far than it was originally intended to spend, and that there must be something wrong somewhere. There surely must be waste or inefficiency somewhere, say the critics, or this could not have come about.

Let us consider the facts. According to Premier Drury's statement at Hamilton, the estimated cost of a 100,000-h.p. development in 1915 was \$10,500,000. In October, 1921, it was estimated by the Hydro-Electric Power Commission

that the cost for five units (275,000 h.p.) would be \$65,000,000. If the cost per horse-power be computed, it will be found to have grown in the estimates from \$105 in 1905 to \$256 in 1921. This seems a remarkable increase, but if the average value of the Engineering News-Record construction cost index number for the years 1917-1921, when the greater part of the Chippawa work was done be compared with that for 1915, when the original Hydro estimates were made, it will be found to be 2.21 times as great. Taking into account only the enhanced cost of materials and labor, without allowance for the known lessened efficiency of the latter during the period under consideration, the cost per horse-power developed should have grown to \$232, or practically the same as was estimated by Hydro for five units last autumn.

It is true that the Chippawa development cost has been high, but it has been the fault of the times, not of the engineering. Perhaps it should not have been carried out at all during the war and the post-war periods, but that was a large question of policy for which governments and not individuals must be held responsible.

EXPANSION AND CONTRACTION OF CONCRETE THROUGH MOISTURE VARIATION

TO the valuable studies already noted in our columns on the behavior of concrete due to temperature changes made by the Engineering Experiment Station of the University of Illinois, there has been added a helpful study of Torata Matsumoto on the effect of moisture content upon the expansion and contraction of plain and reinforced concrete, presented in Bulletin 126 of the Engineering Experiment Station.

According to Mr. Matsumoto, concrete expands when it absorbs moisture and contracts when it dries out in very much the same manner as wood. A concrete of a 1:2:4 mix is likely to contract during hardening as much as 0.05% in an ordinary structure. Such behavior results, of course, in stresses when the concrete is restrained by an external force. If the material be reinforced, the stress in the reinforcement may reach 16,000 to 18,000 lb. per sq. in. when the amount of reinforcement is less than 1½% and the shrinkage stress developed in the concrete may reach its ultimate tensile strength when the amount of reinforcement is greater than 1½%. The greater the percentage of reinforcement, the greater the tensile stress that may develop in the concrete, and concrete having a higher percentage reinforcement than 1½% is likely to have cracks form unless proper provision against them is made.

An interesting observation made by Mr. Matsumoto with respect to work done on the seaboard is that reinforced concrete does not appear likely to be a durable material in a place where a corrosive influence such as sea air is active, unless proper protection against the formation of shrinkage cracks and safeguarding of the steel is made. He suggests that this may be provided either by finding a cement giving less expansion and contraction, or by the use of a perfect water-proofing treatment. It is evident that there is much opportunity for further investigation and study in this particular to the end that structures along the sea-coast may be built of reinforced concrete without fear of disintegration of the reinforcement.

TOPOGRAPHY AND RAILWAY RATES

AN interesting chapter in railway history in Canada is recalled by the recent statement of Premier Oliver of British Columbia that by reason of the C.P.R. entering the mountains through the Klekling Horse Pass instead of the Yellow Head Pass, freight rates were 35% higher for British Columbia than for the rest of Canada. The federal government of that day favored the Yellow Head Pass, as the lowest summit in the range, but the C.P.R., fearful of competition from the United States, wished to run as close to the border as possible. A compromise was made whereby

the company agreed to cross at least 100 miles north of the border and to provide a gradient of not over 100 ft. to the mile. The Kicking Horse Pass was consequently adopted, but it was found impracticable to provide a grade better than 237 ft. to the mile against east bound traffic for about 8 miles, and on this section of line the subsidy could not be collected. Not till 1909, with the construction of the spiral tunnels between Hector and Field was this portion brought to approximately the standard originally demanded by the Government. On it the ruling maximum grade in the mountains, or 2.2% compensated, is now provided.

Apart from the historical aspects of the case, it is only fair that those portions of Canada which are less favorably situated in some respects than others should bear, in some measure at least, the disabilities incident to their geography. The cost of hauling traffic over unavoidably heavy grades cannot be made equal to that for hauling it over the prairies on tangent, any more than the price of Nova Scotia coal can be made the same in Ontario as it is in the province of origin.

PERSONALS

R. S. and W. S. LEA and W. T. FRANCIS have resigned from the Montreal Water Board but have been retained as consulting engineers.

ARTHUR ST. LAURENT, B.A.Sc., M.E.I.C., the recently appointed chief engineer of the Department of Public Works, Ottawa, was born at Rimouski in 1859. He graduated from the Ecole Polytechnique, Montreal, in 1885 and was engaged upon the location and construction of the Temiscouata Railway for three years. Entering the Public Works Department in 1888, he was assistant engineer at the district office at Winnipeg until 1898. Mr. St. Laurent was entrusted with the work of constructing the concrete bridge over the Saskatchewan River at Edmonton in 1900. He designed the lock and dam at St. Andrews in the Red River, north of Winnipeg, and constructed the Laurier Avenue bridge at Ottawa, and the government grain elevator at Montreal. When the construction of the Georgian Bay Canal was first considered, he conducted the topographical survey. In 1908 Mr. St. Laurent was appointed assistant deputy minister of Public Works and in that capacity has been concerned with extensive navigation schemes, harbors and drydocks, besides acting as vice-chairman of the Dominion Water Power Board. Mr. St. Laurent is a member of the Engineering Institute of Canada, of which he was for three years vice-president, member of American Society of Civil Engineers, the International Navigation Congress and the Civil Service Board of Hearing and Recommendation. He was chairman of the Ottawa Branch of the Engineering Institute of Canada in 1914.

GERALD POWER, who was recently appointed president of the Quebec Harbor Commission, was born in Silvery in 1882. He was educated at Mont St. Louis College, Montreal, and later was engaged with the Riviere Ouelle

Pulp & Lumber Co. He is an ex-president of the Canadian Pulp & Paper Association and is now president of the Peninsula Lumber Co.

EDWARD M. PROCTOR, of the firm of James, Proctor & Redfern, Ltd., consulting engineers, Toronto, has returned home after a three months' trip to the Barbados and Central America.

S. FORTIN, assistant director of public works, has been appointed City Surveyor of Montreal, which was the title of that branch of the civic service before the organization of the public works department. By his appointment as city surveyor, Mr. Fortin is duly authorized to sign the official plans of the department, as required by law.

THOMAS ADAMS, of the Dominion Parks Branch, Ottawa, has returned home after a five months' visit to England where he has been associated with Thomas Mawson, the famous landscape architect, in town planning work in London, Northampton, Windermere, Blackpool and other cities and towns. Mr. Adams has just started a course of lectures on town planning at the Massachusetts Institute of Technology, and in the department of Landscape Architecture at Harvard University.

ROGER DEL. FRENCH, professor of highway and municipal engineering, McGill University, Montreal, has issued an announcement that he will accept a limited number of consulting engagements in connection with water supply and sewerage systems, roads and pavements and reinforced concrete structures. Prof. French was a member of the staff of R. S. & W. S. Lea, consulting engineers, Montreal, for nearly ten years, resigning a few years ago to become a member of the firm of Arthur Surveyer & Co., consulting engineers, Montreal. He resigned from the latter firm in order to accept appointment as engineer for the Lignite Utilization Board. Upon completion of the Board's briquetting plant in Saskatchewan, he accepted the chair in the McGill department with which he had been previously connected for a number of years as a part-time lecturer.

FREDERICK W. COWIE, B.A.Sc., M.E.I.C., has resigned from the position of chief engineer of the Montreal Harbor Commission after 36 years service, and has been appointed consulting engineer to the Board. Mr. Cowie graduated from McGill University in 1886 and the same year joined the staff of the Montreal Harbor Commission under Sir John Kennedy, the chief engineer. For the next twenty years Mr. Cowie was directly connected with the St. Lawrence ship channel and is now one of the leading authorities in Canada on river hydraulics, dredging and navigation improvements. In 1907 Mr. Cowie was appointed chief engineer of the Commission upon the retirement of Sir John Kennedy, who was made consulting engineer. During the last fifteen years most important improvements have been made to the harbor and plans formulated by Mr. Cowie in 1909 have been almost completed, the result being that Montreal has one of the most modern harbors in the world. Mr. Cowie was awarded the Telford medal in 1914 by the Institute of Civil Engineers, London, England. He has been a full member of the Engineering Institute of Canada since 1898.

NEW PUBLICATIONS

MULTI-JET CONDENSING plants are described and illustrated in a bulletin No. 1028 issued by the Canadian Ingersoll-Rand Co., Sherbrooke, Que. The principal features of this type of condenser are dealt with and illustrations show the interior construction. Copies may be had on application to the head office or any branch of the company.

THE U. S. BUREAU OF MINES reports that R. Van A. Mills is continuing his study of the action of water on oil and gas strata and has gathered information of exceptional value to oil producers in handling wells that are troubled by deposits of asphaltic residues or salts. Mr. Mills has pointed out the ways in which water can harm oil wells and is now preparing a bulletin on the subject.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Huntsville, Ont., construction of pavement	Mar. 1	Jan. 31
Glenboro, Man., erection of a school	Mar. 1	Feb. 14
Kitchener, Ont., erection of school annex	Mar. 3	Feb. 14
Saskatoon, Sask., supply of generator and turbine	Mar. 6	Feb. 7

BRIDGES, ROADS AND STREETS

Coquitlam, B.C.—Tenders have been called by the Canadian Pacific Railway Co. for the construction of a new bridge across the Coquitlam River. Steel construction with concrete piers.

Islington, Ont.—Etobicoke Township Council authorized the widening of Scarlett Road. Clerk, Stephen Barratt, Islington.

London, Ont.—The question of the advisability of erecting a bridge over the river at Richmond St. will be considered by the City Council. City Engineer, H. A. Brazier.

Niagara Falls, Ont.—The Provincial Department plans the immediate construction of a steel arch type bridge over the Hydro canal at Lundy's Lane. The Department also plans to let contracts in March for six miles of concrete pavement from Bridge St. at Fairview cemetery to St. David's.

Ontario, Province of.—A deputation from the towns of Smith's Falls, St. Mary's, Trenton and Ingersoll waited on Hon. F. C. Biggs, minister of public works, urging that these municipalities be given provincial grants as connecting links of the Windsor to Montreal provincial highways.

Ottawa, Ont.—George Hogarth, chief engineer of the Department of Public Highways, Ontario, announced recently that the Ottawa-Prescott highway would be permanently surfaced from the city limits to Hogg's Back, a distance of over two miles, and also that the missing two miles of pavement on the Ottawa-Point Fortune road a few miles out of Ottawa will be built in the early part of the coming summer.

Sherbrooke, Que.—The City Council passed a by-law authorizing the raising of \$55,000 for the construction of Dufferin Bridge. The bridge will be of concrete and steel construction.

Sherbrooke, Que.—The City Council passed a by-law authorizing the raising of \$200,000, of which \$175,000 is for sidewalks and \$25,000 for the viaduct on Ganit St. Another by-law was passed authorizing the raising of \$75,000, of which \$20,000 is for the levelling of King St. West, and \$55,000 for the paving of King St. West.

Toronto, Ont.—The City Council sent back a recommendation of the Works Committee to construct a new asphalt pavement on Bathurst St., from College to Dupont Streets.

Toronto, Ont.—Ratepayers of the portion of Runnymede recently annexed to the city decided to petition the

Board of Control for a concrete pavement 28 ft. wide on Runnymede Road.

Toronto, Ont.—The City Council instructed Works Commissioner Harris to include in the 1923 estimates \$312,000 for the straightening of Gerrard St., from Logan Ave. to Pape Ave.

Victoria, B.C.—The City Council will have a committee confer with the Victoria West Brotherhood regarding the latter organization's plan to bridge Victoria Arm.

WATER, SEWAGE AND REFUSE

Burlington, Ont.—The Burlington Beach Commission passed a by-law providing for the raising of \$30,000 for the extension of the water works system and connecting same with the water works system of the city of Hamilton. Clerk, M. H. Carroll.

Kingston, Ont.—The City Council passed a by-law providing for the construction of a sewer and 6-in. water main in Regent St. from Johnson to Park St., and Dundas St., from Macdonnell to Regent St. Estimated cost, \$24,256.66. Clerk, W. W. Sands, M.D.

Mimico, Ont.—A complete water system for a district north of Mimico, comprising about 13 acres, was authorized at a recent hearing before the Ontario Railway and Municipal Board, at which the Etobicoke Township Council presented the application.

Montreal, Que.—Ald. J. N. Sansregret has asked the executive committee of the City Council to authorize the laying of sewers in several portions of Delorimier Ward. The executive committee has referred the demands to S. Fortin, assistant director of public works, for an estimate of the cost.

Montreal, Que.—The list of streets on which sewers will be laid in the north end of the city is as follows: Birnam St., from Beaumont St. to Cremazie Boulevard, \$65,000; Stuart St., from Cremazie Boulevard to Beaumont St., \$65,000; Lanorlie St., from Abraham St. to Cremazie Boulevard, \$42,000; Allan St., from Ball St. to Ogilvie St., \$16,550; Anvers St., from St. Adele St. to Lanoraie St., \$3,553; Ogilvie St., from Lanoraie St. to Stuart St., and from Birnam St. to Allan St., \$3,430.

Niagara Falls, Ont.—The City Council intends to construct the following sanitary sewers: McRae St., from Slater Ave. to lot 157, \$4,636.68; Florence Ave., from McRae St. to Stamford St., \$3,207.25; Stamford St., from Florence to Burn, \$4,354.86; McDonald Ave., from Stamford to Kitchener, \$2,134.70; Kitchener St., McDonald to Powell, \$2,558.92. City Clerk, W. J. Seymour.

Peterboro, Ont.—The City Council intends to construct a sewer on Rogers St. City Engineer, R. H. Parsons.

Peterboro, Ont.—City Engineer R. H. Parsons will report to the Board of Works on the cost of a sewerage system for the Engleburn district of the east end of the city.

Sherbrooke, Que.—The City Council passed a by-law authorizing the raising of \$120,000 for sewers.

Toronto, Ont.—The City Council approved of the transfer of 4.2 acres of land at the old cattle market to the street cleaning department for use as a site for a garbage destructor.

Woodbridge, Ont.—At a recent meeting held here Engineer E. A. James, Toronto, presented plans and estimates for a water system. It is proposed to obtain the water from wells. The system would at first include only the business centre and the main streets of the village, but the plant would be large enough to provide for extensions. The cost

of a partial distribution plant, pumping station, standpipe and wells was estimated at between \$25,000 and \$30,000.

LIGHT, HEAT AND POWER

London, Ont.—A definite decision to take immediate action on the plan of Mayor J. C. Wilson to build a new dam in the Thames river at Springbank was reached by the City Council. Application will be made to the Legislature to validate a bond issue of \$140,000, and the Public Utilities Commission will be authorized to proceed with the work.

Port Perry, Ont.—It is expected that Hydro will be extended to Port Perry by next September. Power will be brought from Cannington. At Greenbank the power line will split, one branch going to Uxbridge and the other to Port Perry.

St. Thomas, Ont.—The City Council passed a by-law authorizing the raising of \$15,000 for the purchase of transformers.

RAILWAYS

Edmonton, Alta.—Premier Herbert Greenfield announced that further extensions to the Lacombe and North Western Railway, owned and operated by the Provincial Government, will be made this year.

Galt, Ont.—A resolution calling for the electrification of the Galt-Elmira branch of the G.T.R. system of Hydro radials was passed at a recent meeting held in this city of representatives of municipalities along the line.

Toronto, Ont.—The City Council passed a resolution requesting the Provincial Government to permit the immediate construction of the Toronto-Port Credit Hydro-radial Railway.

Windsor, Ont.—Plans for the construction of the new C.P.R. freight sheds and tracks have been completed. Address F. M. Rutter, superintendent of the London Division, C.P.R.

Windsor, Ont.—It is reported here that the Ontario Hydro-Electric Power Commission contemplates taking over the Pere Marquette, the Windsor, Essex & Lake Shore, and the Chatham, Wallaceburg & Lake Erie Railway. In this event the Pere Marquette Railway would be electrified.

FACTORIES AND LARGE BUILDINGS

Assiniboia, Sask.—Plans and specifications for an addition to the school, estimated to cost \$15,000, have been secured by the trustee board. Secretary, J. B. Smith.

Athens, Ont.—The Athens High School Board instructed A. S. Allaster, Brockville, to prepare plans and specifications for the reconstruction of the High School.

Bathurst, N.B.—The Bathurst Lumber Co. is proposing the erection of a ground-wood pulp mill at a cost of approximately \$550,000. Angus McLean is president and general manager. William Kennedy, Jr., 364 University St., Montreal, is consulting engineer.

Birchcliffe Heights, Ont.—The Sons of England will erect a hall, as also will the G. W. V. A.

Birchcliff, Ont.—The High School Board decided to erect a High School at Stop 29, Kingston Road, at a cost of \$125,000.

Birchcliffe, Ont.—Scarboro Township Council issued debentures amounting to \$60,000 for the erection of a school.

Blenheim, Ont.—Dr. Mills, provincial inspector of continuation schools, has recommended the erection of a four-room high school here.

Bolton, Ont.—Robert Caldwell has been authorized to prepare plans for the rebuilding of the Town Hall.

Brampton, Ont.—Improvements estimated to cost \$34,500 are planned to Peel County Memorial Hospital.

Campbellford, Ont.—Tenders for the erection of a High School will be received until March 7 by S. B. Coon & Son, Architects, 4 St. Thomas St., Toronto.

Cooksville, Ont.—The Centre Road Community Association plans the erection of a school. President, W. R. Wadsworth.

Courtenay, B.C.—The machine shops of the Comox Logging Co., near here, were almost totally destroyed by fire recently. The shops were equipped with machinery valued at about \$50,000.

Edmonton, Alta.—The trustees of Westminster Ladies' College plan the erection of a college building at a cost of \$25,000.

Edmonton, Alta.—Estimates for a new Isolation Hospital will be discussed by the city board of health. In all likelihood, the board will decide to inform the City Council that the sum of \$125,000 proposed is too small and that a larger amount should be raised.

Elmira, Ont.—The ratepayers of School Section No. 6 of Peel, Wellington County, decided to build a public school next summer. Tenders will be called.

Elmsdale, N.S.—The Nova Scotia Clay Works, Ltd., decided to add two new kilns to their brickmaking plant.

Fort William, Ont.—The Great Lakes Pulp & Paper Co. will spend \$2,000,000 on a paper mill here within three years, their time for so doing having been extended by a year.

Fraserville, Ont.—The erection of a new station is projected.

Fredericton, N. B.—At a cost of approximately \$25,000 Cathedral Memorial Hall will be erected next summer. Plans for the building were prepared by Delancy Robinson, of New York, and tenders will be called for shortly.

Galt, Ont.—The International Tank and Silo Co., Ltd., will erect a plant in this city shortly. Edward Stuart, of Toronto, and John Murphy, of Winnipeg, are chief partners in the company.

Greencourt, Alta.—The Gillespie Elevator Co. plans the erection of a grain elevator here this spring.

Haney, B.C.—The erection of a High School is projected.

Hamilton, Ont.—The Centenary and Charlton Avenue Methodist Churches are considering a plan to amalgamate and erect a new church at an estimated cost of \$500,000.

Hamilton, Ont.—The City Council will submit a by-law to the ratepayers to provide a free site and a substantial sum toward the cost of the buildings in connection with the proposed removal of McMaster University from Toronto to Hamilton.

Humber Bay, Ont.—The ratepayers authorized an issue of debentures amounting to \$90,000 for an addition and equipment for the Humber Bay School.

Kitchener, Ont.—A permit has been issued to the Kitchener Motor Sales Co., 126 King St. East, for the erection of a motor sales building at a cost of \$18,000.

Kitchener, Ont.—The City Council endorsed the finance committee's suggestion that a by-law be prepared authorizing the building and equipping of a Collegiate and Vocational School, of which Kitchener's share is not to exceed \$225,000. The entire cost of the school is estimated at \$490,000. The Town Council of Waterloo, which municipality will figure jointly in the Collegiate with Kitchener, have already passed in favor of their share.

Lethbridge, Ont.—A site for a new church on the corner of Fifth Ave. and Eleventh St. has been purchased by the Christian Church. Pastor, Rev. Mr. Howard.

London, Ont.—The establishment of a High School in Middlesex County is proposed.

London, Ont.—The members of St. Patrick's Church, Dundas St., decided to erect an addition to the building.

London, Ont.—The city is now asking the Legislature for authority to issue debentures amounting to \$250,000 for Western University.

London, Ont.—The Board of Education decided upon a building program for this year entailing an expenditure of approximately \$700,000. A branch collegiate is to be erected in South London at a cost of about \$220,000, a school to replace Empress Ave. in West London will cost about \$195,000, including the site; another new school in

the Ealing district, on the corner of Dakin, and Price streets, will cost \$82,000; and an auditorium, gymnasium and additional classrooms for the Technical and Arts School will cost \$120,000.

Melbourne, Ont.—The ratepayers decided to erect a four-room school.

Mildmay, Ont.—Trustees of public school section No. 3, Carriek, plan the erection of a brick school next summer, at a cost of \$6,000.

Montreal, Que.—E. Z. Trudel has been appointed as architect in connection with the erection of the proposed new Homeopathic Hospital. Estimated cost, \$225,000.

New Toronto, Ont.—The School Board plans the erection of a four-room school.

New Toronto, Ont.—The School Board has requested the Town Council to supply funds for the erection of a school.

Niagara Falls, Ont.—Fire damaged the crusher house and bins of the Queenston Quarry, Ltd., at St. David's to the extent of \$10,000.

Oshawa, Ont.—Fire destroyed the Thornton Rubber Factory, the loss being estimated at \$100,000. Owners, Morson, Boswell Co., 64 Wellington St., Toronto.

Ottawa, Ont.—Application will be made to the Legislature for authority to raise \$30,000 for repairs and alterations to the Fire Stations and the City Hall.

Ottawa, Ont.—The Hamilton Tar Products Co., Ltd., of Hamilton, Ont., are erecting a plant here for refining tar for road building and roofing purposes and for the recovery of by-products.

Ottawa, Ont.—The wholesale grocery warehouse owned and occupied by John Dover & Son, at 21-23 York St., was practically destroyed by fire. The building was valued at about \$25,000.

Owen Sound, Ont.—Fire on Feb. 17 destroyed the Kilbourn Block, the loss being estimated at \$40,000 for the building alone. The building was occupied by W. T. Harris & Co., Wholesale Grocers, the Kilbourn Estate and the Empire Store Co.

Pembroke, Ont.—The erection of a new building next summer to replace the present Cottage Hospital is projected.

Port Arthur, Ont.—A permit has been issued for the construction of an elevator by Parrish and Heinbecker, of Winnipeg, on the Port Arthur water front. The permit calls for an all-concrete building with a capacity of 250,000 bushels.

Port Colborne, Ont.—Fire destroyed a warehouse of the Maple Leaf Milling Co., used by the Ontario Bag Co.

Port Stanley, Ont.—Tenders will be called immediately for the construction of a dancing pavilion for the London & Port Stanley Railway Co.

Quebec, Que.—Arrangements have practically been made by the Quebec Harbor Commission with Allan C. McAvity, of St. John, N.B., for the erection and operation of an oil fuel plant in Quebec similar to the plants now in operation at Halifax and St. John.

Quebec, Que.—Excavation was started here last week for a 23-storey addition to the Chateau Frontenac. This block will rise in the centre of the quadrangle now formed by the hotel, and will take the form of a huge tower. Anglin-Norcross, Ltd., Montreal, have the general contract, and the Dominion Bridge Co., Ltd., have the contract for the structural steel.

Ranfurly, Alta.—The erection of a school is projected.

Ste. Marguerite Du Lac, Masson, Que.—The parish church of this village and the convent of the Sisters of Providence were destroyed by fire. Estimated cost, \$80,000.

St. Mary's, Ont.—The Verdun Club plans the erection of a clubroom and gymnasium. Address W. N. Harrison.

Silverthorne, Ont.—The ratepayers decided to authorize the public school trustees of S. S. 35 to issue debentures amounting to \$21,000, for the purpose of a school site and for the erection of four temporary rooms.

Smith's Falls, Ont.—The members of Westminster Presbyterian Church plan the erection of a new church.

Stratford, Ont.—The Board of Education approved the tender of John L. Youngs for the construction of a four-

room addition to Hamlet Ward School, at a cost of \$41,975.

Stratford, Ont.—The Board of Education approved the tender of John L. Yonge for the construction of a four-room addition to Hamlet Ward School, at a cost of \$41,975. The Board is also considering the provision of additional accommodation in Shakespeare Ward.

Streetsville, Ont.—The Public School Board is considering the erection of a four-roomed school. Estimated cost, \$50,000. Chairman, J. H. Atkinson.

Sudbury, Ont.—The Salvation Army plan the erection of a barracks at a cost of \$15,000.

Sudbury, Ont.—Revillon Freres plan the erection of a two-storey building on Station St.

Sudbury, Ont.—J. A. Holmes plans the erection of block this spring. D. L. McKinnon & Sons will also erect a new block.

Sudbury, Ont.—The Sudbury Separate School Board have called for tenders for a 4-roomed school to be erected at a cost of \$40,000.

Sudbury, Ont.—Plans have been prepared for the proposed new Regent Theatre, and work will start in the spring. Manager, Mr. Stevens.

Thorold, Ont.—A by-law will be submitted to the ratepayers to provide \$60,000 for additional High School accommodation.

Toronto, Ont.—The Board of Education will call for tenders at once for the construction of the new McMurrich and Kimberley Schools.

Toronto, Ont.—The Separate School Board will break ground this week for the erection of a school on Jane St. north of Bloor St.

Toronto, Ont.—The Merrill Building System will construct a \$125,000, electrically equipped apartment house at Earl and Jarvis Streets.

Toronto, Ont.—A campaign for a new \$100,000 home for the Humane Society may be started next June, Manager J. W. Wilson announced.

Toronto, Ont.—The erection of a six-storey physicians and surgeons building at 86 Bloor St. West is projected. Address H. Addison Johnston.

Toronto, Ont.—The members of Danforth Ave. Methodist Church considering the erection of an addition to the church. Pastor, Rev. J. J. Coulter.

Toronto, Ont.—Monarch Park Highways' and Business Men's Association are considering the erection of a Community Hall near Coxwell and Danforth Avenues.

Toronto, Ont.—It is expected that tenders will be called for by the Board of Education for the erection of the East End branch technical school in two weeks' time.

Toronto, Ont.—The Board of Education will prepare plans and call for tenders for the addition of four classrooms at Givens St. School. Estimated cost, \$50,000.

Toronto, Ont.—Business Administrator W. W. Pearce will report to the Board of Education on the provision of additional accommodation for Ryerson, Brant and Manning Schools.

Toronto, Ont.—A permit was issued to the Separate School Board for the erection of a two-storey brick school on the southwest corner of Clifton road and Garfield Ave., at a cost of \$60,000.

Toronto, Ont.—The Board of Control approved of the project to erect a civic stadium to be known as "The War Memorial Stadium." The Sportsmen's Patriotic Association estimates the cost at \$150,000.

Toronto, Ont.—The board of managers of Christ Church has purchased the northwest corner of Lawton Boulevard and Heath St., and will commence building a new church and parish house shortly.

Toronto, Ont.—The erection of four stores with two five-roomed apartments above each, involving a total of close to \$100,000, on a site 38 by 100 ft., at the corner of Lansmore Crescent and Danforth Ave., is planned by Andrew Simone and Vito Leo, fruit dealers.

Toronto, Ont.—Excavation work has started for the erection of a 16-room separate school on McDonnell Sq. which will cost about \$150,000. The Separate School

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Municipal Asphalt Plant at St. Catharines, Ont.

Description of Hetherington & Berner Paving Plant—Will Turn Out 100 Sq. Yards of 2-in. Surface per Hour—Economies Effected in Operation — Facilitates Handling of Materials

By W. P. Near, B.A.Sc.,
City Engineer

DURING the year 1921 the city of St. Catharines joined the growing group of Ontario municipalities who now own and operate their own asphalt paving plants which enables them to not only make the necessary repairs to existing asphaltic pavements but also to construct new pavement surfaces at a more economical cost than under the contract system where more expensive portable asphalt plants are used. Tenders were called March 17, 1921, and the contract for the plant was awarded to Hetherington & Berner of Indianapolis. The contract called for completed erection by June 30 and the plant was put in operation in July. As there were some unusual features in the arrangement of the units a description of the plant may be of interest at the present time.

The main plant is the standard semi-portable type built by Hetherington and Berner to turn out 100 sq. yds. of 2-in. surface per hour and various units are designed accordingly.

Sand Dryer Unit

The sand dryer is of 8 ton capacity having a rotary drum 42 in. in diameter and 16 ft. in length. The drum is fitted with spiral flights to carry the sand through the drum, and box sections to elevate and drop sand through the hot blast. The dryer is equipped with a fuel oil burner ("Best" type) and also grate bars for coal burning; the change from fuel oil burning to coal grates may be made in half an hour's time. The dryer rests on a brick foundation 20 in. above grade of yard and hence permits of easy firing when coal is used. The fuel oil burner was used throughout the season and was found to be most effective as well as economical. The regulation of the heat is easily controlled and in case of a shut down of the plant, the heat may be shut off immediately and thus prevent any danger of the dryer becoming overheated.

The fuel oil is supplied from a 100 gallon tank on top of the dryer housing and the oil is steam heated and fed by steam pressure. A 600 gallon tank from an old sprinkling wagon is located adjacent to the dryer foundation and used

for fuel oil storage, and a steam ejector charges the 100 gallon tank from the storage. The 100 gal. feed tank should be larger, say 150 or 200 gallon capacity, to hold a supply of fuel oil sufficient for half a day. It is necessary to shut down the burner to charge the feed tank and the smaller tank necessitates a delay of a few minutes in the plant operation morning and afternoon which could be obviated by increasing its capacity.

The fuel oil burning has an advantage in that the dryer can be raised to proper temperature in 15 minutes time when starting up the plant in the morning whereas coal firing requires two hours or more and an extra fireman

Asphalt Melting Plant

The kettle unit consists of one stationary steam melting tank of 12 tons capacity or a quantity sufficient for a run of nine hours without refilling. Steam melting is used to avoid the possibility of burning or coking the asphalt. The kettle is built so that asphalt from barrels or tank cars may be used. An asphalt reservoir of 18,000 gallons capacity fitted up with steam coils on bottom of tank is built underground. This permits the asphalt from the tank car to flow by gravity

to the reservoir where it is kept at about 210 degrees Fah. An air lift system is located in a pit so that the receiver is below the bottom of the asphalt reservoir and by means of this air lift and arrangement of valves, the following operations of lifting the asphalt are carried out.

1. The melting kettle may be charged from the asphalt reservoir. This operation is carried out at the end of a day's run and the kettle is then heated by steam during the night and is ready for operation in the morning.

2. The asphalt is discharged from the melting kettle to the asphalt bucket on the weighing scales during the day's operations.

3. The asphalt may be discharged direct from the reservoir to the weighing bucket.

Difficulty was experienced with the first tank car of

GENERAL VIEW OF PLANT

asphalt emptied into the reservoir. A heavy rain storm caused water to get in the reservoir and made the hot asphalt foam. It was then discovered that water was seeping through the wall of the reservoir at the corner of the boiler house. The wall here was uncovered and plastered on the

FIG. 2—SECTION THROUGH ASPHALT RESERVOIR, AIR LIFT PIT AND STEAM MELTING KETTLE

outside, and there was no further trouble from this cause. However the foaming of the asphalt caused such serious interference with the plant operation that an auxiliary asphalt pump was installed so that asphalt could be pumped direct from the tank car to the melting kettle in case of trouble from water in the asphalt reservoir. However, it has not been necessary to use this auxiliary pump.

The asphalt reservoir permits the buying of asphalt in tank cars instead of packages at a considerable saving in first cost. It also eliminates the elevating and handling of barrels into the kettle. It permits of the storage of nearly three tank cars of asphalt and the immediate unloading of the car resulting in saving demurrage charges. Several tank cars were placed, heated, discharged and shipped out in 24 hours.

The Mixing Unit.

The asphalt lift consists of a Westinghouse air compressor, air receiver tank and asphalt lift tank. The lift tank and all pipes and valves which handle hot asphalt are steam jacketted.

The hot material elevator delivers the hot mineral aggregate from the discharge chute of the sand dryer to a rotary screen mounted in the top of the sand bin and provided with two sizes of screen for sand and $\frac{3}{8}$ -in. stone. The hot material storage bin which has a total capacity of 9 tons, is divided into two compartments suitably proportioned for sand and stone, and is provided with tallings chute and overflow chute.

The sand and stone weighing box has a capacity of 10 cu. ft. and rests upon a 2000 lb. platform scales having three beams, one each for sand, stone and dust. All beams are enclosed in a dust proof casing and are supplied with an outside indicator and beam triggers.

The asphalt weighing bucket has a capacity of 2 1/3 cu. ft. and is suspended from a scale having a capacity of 625 lbs. The bucket is charged with asphalt from the air lift tank and by a trolley arrangement is propelled over the mixer where it is discharged. The mixer which is steam jacketted has a capacity of 9 cu. ft. sufficient to take a 1100 lbs. batch and is of the two shaft pug-mill type. The gate of the mixer is of the rack and pinion type and is operated by a hand wheel. The mixer floor is 10 ft. above the grade level of roadway which permits ample clearance on the driveway for waggons or trucks.

The plant is driven by a 30 h.p. 550 volt motor with the exception of the Westinghouse air compressor and the emergency asphalt pump which are operated by steam. A 45 h.p. vertical boiler supplies the steam for the steam melting, steam jacketted pipe lines, tank car heating, etc. A tilt steam trap returns the water of condensation from the steam coils and steam jacketted pipes to a reservoir alongside the boiler and this hot water is returned to the boiler by a boiler feed pump. A floor slab over half of the asphalt reservoir is used for the boiler and air compressor room and forms a convenient and compact layout for the steam and air lines. The other half of the reservoir is housed over but is arranged with ventilators and doors for agitation of the asphalt in case of foaming.

Plant and Yard Lay-Out

The site for the plant was chosen in a Y between two railroad sidings and the layout has proven to be most economical from an operation point of view. It is possible to have a car of each of seven materials placed properly for unloading at the same time, viz.: stone dust, fine sand, medium sand, $\frac{3}{8}$ in. stone, screenings, coal and asphalt. The cold material elevator is placed on the end of the dryer and all of the ingredients are located at short range so that they may be shovelled or wheeled in barrows to the elevator. The stone dust shed is located so that the dust may be unloaded readily from a car for storage or carried direct from the car to the plant or from the storage to the plant. The job crane hoist on the kettle floor of the plant designed to hoist the barrels of asphalt is used to elevate the bags of stone dust to the mixer floor. The office is so located that the windows command a view of the cold material elevator and the driveway through the plant thus enabling the inspector to check the feed of the elevator and the batches and loads through the plant. Fig. 3 shows the location of the asphalt reservoir with boiler house above, and of the auxiliary asphalt pump and pipe line to the other siding. The fuel oil storage is placed alongside the dryer and immediately below the feed tank. The motor has a separate house to exclude dust. The whole plant is housed in a corrugated iron building and designed to provide ventilation in summer time and to be readily closed in when the plant is not in use. The total cost of the whole plant including 7 ton tandem roller, fire waggon and all tools for street work was \$33,000.

The plant was used to construct 30,000 sq. yds. of 2-in. stone filled sheet asphalt during the season and showed a larger capacity than 100 sq. yds. per hour. During a nine hour day 1057 sq. yds. of 2-in. surface was turned out.

FIG. 3—PLAN SHOWING LAY OUT OF PLANT

CHARACTERISTICS OF RAIL-CARBON STEEL*

Manufacture, Qualities and Uses as Reinforcement Bars — Rail Steel a Reliable Material — Cushioning of Concrete Precludes Rupture of Bars by Shock

By J. B. Carswell

President, Carswell Construction Co., Toronto

IN DISCUSSING the qualities and uses of rail-carbon steel bars as used in reinforced concrete structures, let us, in so far as it is humanly possible, lay aside for an hour at least, all the prejudices and enthusiasms we may have on the subject and approach the question with an absolutely open mind. Let us lay aside at the same time, all the secondary evidence which seems to be so prolific when this question is discussed; all the statements about poor material which somebody else encountered; about bars that broke on some other engineer's job; about the difficulties some one else had in bending bars; and if we do this, I think we will be surprised at the small amount of real adverse evidence that remains.

Source of Material

In studying this subject, the first question is naturally as to the origin or birth of the rail-carbon bar. When the rolling stock on steam railroads began to increase rapidly in size and weight, the wearing quality and strength of the rail became increasingly important. Engineers were soon looking round for a material that would withstand the wear; that would withstand vibration, and would withstand the sudden impact at 40 deg. below or 100 deg. above. The modern rail is the result of years of such investigation, composed of super-refined steel with a high carbon content, which carries with it a certain amount of brittleness, yet ductile enough to withstand the pounding and vibration of a modern locomotive flashing over it; a steel which is hard enough, not only on the surface, but right through its structure, to stand up against the grinding action of the wheels when a train is brought to rest, a quality which again carries with it a high elastic limit.

Such is the rail being sold today; such is the rail with perhaps a little less refinement that was sold 15 or 20 years ago, and such is the material from which rail steel bars are rolled.

The second aspect of the subject also starts away back some 30 years ago when reinforced concrete structures began to appear. Up to this time, practically all structural work was carried out with steel framing, and one of the essentials in the material for a steel shape was, and still is, ductility or toughness. Nothing but a tough material could stand up to the punching and shearing in the steel fabricating shop; nothing but a tough material should be used in a lattice steel railroad bridge subject to intense shocks and vibrations.

Therefore, when engineers started out on the design of reinforced concrete structures, it was natural that they should follow the same specifications for their steel—a specification which had stood them in good stead for many years, a specification which was safe and conservative, that is, a mild steel specification. No criticism can be offered or the engineers so doing, because very little was then known about what was happening inside that combined steel and concrete girder; in fact to-day, after 30 years' research, the subject is by no means exhausted.

Cushioning Effect of Concrete

But to-day certain things have been proved about reinforced concrete, and proved beyond any further doubt, and the first is, that unlike a steel structure, no external stress can reach an individual rod, and no external stress can reach a group of rods in 100% intensity. I have a feeling that many engineers do not quite realize the importance of that phase of reinforced concrete design. To my mind, it is akin to the change in practice in life insurance com-

panies. If my father had insured his life for \$100,000, one company would have carried the policy and would have stood the whole stress of payment, but today if I insured my life for this amount, the policy would be divided up among probably 30 companies. It is just the same in concrete work, the bars work in teams.

The second is that concrete has a most positive deadening effect, when the structure is exposed to vibration or shock. I will refer to this later on in more detail.

The third point is, that in a well balanced design, the governing factor is the elastic limit of the steel. The higher the limit on which you can depend, with the same factor of safety, the more economical the design.

It follows, therefore, that in using mild steel for concrete work, we are sacrificing a great deal of strength, sacrificing a possible saving in material and a consequent economy, all for the purpose of getting a ductile or tough material.

This sacrifice was absolutely necessary in structural steel, but the question I would ask is: Are we not following a false analogy when we make this sacrifice in reinforced concrete? Is there any necessity to sacrifice strength, or conversely sacrifice economy for the sake of great ductility in the rods?

The answer to that question I believe is given in the fact that hard-grade bars soon began to appear on the market, bars in which the carbon was increased to around 40 to 45 points, bars of a higher elastic limit, but still ductile enough to stand the handling and bending. Eleven years ago, in 1911, the American Society for Testing Materials set up a standard specification for billet steel reinforcing bars, divided into three classes, Mild or Structural grade, Intermediate and Hard Grade, in which the Mild grade was given a yield point of 33,000 lb., the Intermediate, 40,000 lb., and the Hard Grade, 50,000 lb. per sq. in.

Rail Steel First Utilized

Some years before this, in fact it is about 20 years ago now, someone, I don't know who, noticed that the physical properties of these hard grade steel bars were practically identical with the physical properties of steel railroad rails, and the thought at once occurred to some steel manufacturers in the States that there was quite a supply available of second-hand rails coming from the big railway systems which could be used as billets from which to roll rods and which could be purchased cheaper than they could themselves manufacture the new billet.

Hence the birth of the rail-steel reinforcing bar industry, which today has reached enormous proportions and is growing rapidly in importance all over this continent. There are in the Dominion and the United States some nineteen large mills engaged in the business, rolling down about one million tons annually of bars, angles, flats, and other small shapes, all from railroad rails, and representing a capital investment of over 20 million dollars.

In 1913, the American Society for Testing Materials recognized the industry by setting up another standard specification for rail-steel bars after an exhaustive investigation had been made.

To sum up these preliminary remarks, we have an industry which has evidently come to stay, and it would appear to be our duty as engineers to investigate thoroughly the question whether or not this industry is based on sound engineering principles. If the answer is in the affirmative, then, inasmuch as the use of this product entails a considerable economy, it would again appear to be our duty to use the material. There undoubtedly is an economy in the purchase price, another economy possible in design, and a third, though indirect economy in the fact that through the existence of this industry, railroad companies are getting much better prices for their second-hand rails than they did when they were sold to be remelted. In other words, there is a national conservation of "work done" in the form of the rail billet. On the other hand, if the answer is in the negative, then it is high time we were rid of an industry and a very healthy industry too, which is putting on the

*From an address before the Toronto Branch, Engineering Institute of Canada, Feb. 16.

market something that is improper from an engineering standpoint. You will see then, gentlemen, that we have a question before us that cannot be lightly thrown to one side, and is certainly worthy of some thought.

I will be quite candid in saying then, that I will try to present to you the affirmative argument, and show that the material is a proper one, and that it is as good if not better than other materials of its class on the market, but let me emphasize the fact that I am wide open to conviction, and would be more than interested to hear the arguments on the other side, and I trust these will be forthcoming in due course.

Origin of Rails Used

Well then, let us start at the beginning, with the raw product. The first question naturally is, when were these rails originally rolled, where were they rolled, and under what specifications. To answer this question I sent out enquiries and personally helped in part to examine some 15,800 rails at various mills in the States and here in Canada. The results I got were these, that the average age of all these rails was 18½ years, that is to say, the average year of rolling was 1903. I found a sprinkling of rails between 35 and 40 years old and one solitary rail which had been rolled in England in 1872, or 49 years ago, another single rail rolled by the Mersey Steel Co. in 1876, or 45 years ago. The period 1900 to 1910 had, however, produced proportionately more rails than any other period. In one mill, I found 106 rails from these limits out of 294 counted, or 36%. In another mill, 75 out of 129 or 58%, in another, 62 out of 204 or 30%, in another 21½%, in still another 53¼%. One mill reported their entire stock as being rolled between these limits, but this was no doubt only a coincidence. The conclusion arrived at was that 1903 was the average rolling year and that 90% of all rail-steel bars on the market today came from rails rolled in the 7 years previous and the 7 years after that date. In Canada 50.5% were rails of English origin and 49.5% American or Canadian. The rails without exception were standard "T" rails, the weights varying from 60 lb. to 100 lb., with a large preponderance of 80-lb. rail.

The next step in our investigation is naturally to find out the conditions maintaining in rail manufacture around the year 1903, and in the seven years previous. Now herein lies one of the weaknesses of this argument, and perhaps the only real weakness from a conservative engineer's standpoint. He does not know definitely under what specifications or under what conditions some of these rails were rolled. We can all look back 18½ years, which is the average age of the rail, that is to 1902 and 1903, and we know that at that time rails were being rolled under a very rigid specification, in fact, practically the same specifications minus a few refinements that prevail to-day. But what we do know about these older rails is that they have stood up just so many years longer to the hard wear and tear of service in the roadbed, that for so many years more they have had locomotives pounding and grinding over them, without showing effects as quickly as the newer rails. This would seem to indicate that if anything they were composed of better material than the more modern rails.

Composition of Old Rails

In looking up the English records, I find that as a matter of fact, analyses of steel rails were not specified until 1890 or 32 years ago. Up to that time the steel manufacturers seem to consider analyses as part of their own stock-in-trade; part of their secret process, only to be given out in confidence. As an instance of this attitude, the head of the inspection company which carried out the inspection of the Forth Bridge in Scotland, informed me that the steel manufacturers would only give out their analysis as a special favor, and that he only saw one analysis on the whole job. This is just over thirty years ago. But when we come down to 18½ years ago, the period in which we are particularly interested, we find quite definite analyses and quite definite specifications.

I have before me a specification of the Illinois Steel Co., dated January 1, 1899, or 23 years old, giving the chemical composition of all their sections from 50 lb. to 100 lb. in weight. The carbon content of the 50-lb. rail was 0.35 to 0.45, the phosphorous not over 0.10, the silicon not over 0.20, and the manganese, 0.70 to 1.00. While in the 100-lb. section, the carbon was higher, namely, 0.45 to 0.55, the phosphorous and the silicon the same, and the manganese from 0.80 to 1.10. On the inspection of the rail the specification reads in part as follows: "The manufacturer shall furnish the inspector, daily, with carbon determinations of each heat and a complete chemical analysis every 24 hours, representing the average of the other elements contained in the steel."

In 1895, which is about as far back as we need go, being eight years prior to the average rolling age, William Hunt, in reporting to the International Railway Congress, gave the following information on New York Central practice.

Five types of rails are used, all of Bessemer acid steel, 65, 70, 75, 80 and 100-lb. per yard; every heat is analyzed for carbon and at least two complete analyses are made each day." The following is the standard specification:

	80 lb. Rail Per cent	100 lb. Rail Per cent
Carbon	.55 to .60	.65 to .75
Silicon	.10 to .15	.10 to .15
Manganese	.80 to 1.00	.80 to 1.00
Sulphur	.069	.069
Phosphorous	.060	.060
Rails are rejected with less carbon than	.55	.65
Rails are rejected with more carbon than	.60	.75
Tensile strength.....	49 tons per square inch	58 tons per square inch
Extension	6 to 12%	

Reporting on English practice on the same date, 1895, Mr. Hunt gives us the following:

"Manchester, Sheffield & Lincolnshire Railway — The steel rails are 86 lb. per yard, and are laid in 30-ft. lengths. The chemical specification prescribes the following:

Carbon to be from	.3 to .45%
Silicon, maximum	.06%
Phosphorous, maximum	.06%
Sulphur, maximum	.06%

In the following test a 5-ft. length is carried on 3 ft. 6-in. bearings, and subjected to three blows from a 10 cwt. weight falling through 10 ft. The rail must not break, nor take a permanent set after the first blow exceeding 1¼ in. Rails are renewed after they are reduced by wear to 72 lb. per yard."

Drop Test

I am particularly interested in this the first mention I can find of the "drop test" on rails, as to my mind this test is one of the most severe imposed on any commercial steel. This note would indicate that the drop test was in vogue in 1895, or 27 years ago, so that the conclusion naturally is that all of the steel rails in which we are interested, except a few old stragglers, have been subjected to the drop test.

In 1906, or 16 years ago, the standard specifications of the American Steel Manufacturers gives the drop test almost word for word with the current specifications of to-day, the trip being 2,000 lb. and the drop for 100-lb. rails being 18 ft.

Before leaving the subject of these older rails, it is quite interesting to look back at the birth and development of the steel rail. Ninety-two years ago Robert L. Stevens, the chief engineer of the Camden and Amboy Railway, was sent over to England to purchase rails, and on the way over he whittled out of a piece of wood a template of the first "tee" rail with a flat base, just as we know it to-day. The first "tee" rail rolled on this side was made by the Montour Rolling Mill, Danville, Pa., in October, 1845. The first

Bessemer steel rail was made in England by Mushet in 1857, so that before we became really interested in the material, a period of about forty years had elapsed, during which time the process was year by year being improved.

In 1885, the American Society of Civil Engineers appointed a standing committee on rails which sat for eight years and in 1893, this committee reported and brought in the standard A.S.C.E. sections which are well known to every railroad engineer. In 1901 the A.S.T.M. published their first rail specification. So, in general we see that the railroad rail has been studied and mothered by the best engineering brains of the country for half a century before we reach the 1903 period in which we are vitally interested.

Careful Purchasing of Rails

The next phase to be considered is naturally the purchasing of the rails. All material entering a rail-steel mill is bought under a strict specification, reading briefly as follows:

"The section must be 50 lb. or heavier, 5 ft. and over in length, free from frog switch, guard curve, bend or twist, and free from split head."

Now there are three safeguards preventing any laxity on this specification. The first is the rigid inspection of the material as it enters the yard, but the second is even more effective, as it is automatic in action. If a rail with, say, a piped head should get as far as the heating furnace, in the first pass through the mill proper, the head will open up and jam in the guides, and the whole process from the handling in the yards to the shipping platform will come to a standstill until the rolls can be cleaned and reset. The operation takes about half an hour, so you can well imagine that the mill-owners are not over-anxious to have this happen too often, and incidentally the bar from the piped rail is never made and never can be made.

The third safeguard against defective material getting into the mill is the fact that if culling has to be resorted to after a shipment is accepted, it means a financial loss to the company, since the defective rails are only good for re-selling as melting scrap at a much lower figure.

Before going more fully into the properties of rail-steel bars, it will be interesting to refresh our memories on the process of manufacturing the rail itself. (Mr. Carswell here exhibited a series of slides showing rail manufacture up to the point of rolling).

May I point out here the similarity of the rail head and the billet. The rail-head is nothing more or less than a billet a little smaller in size, and it is exactly the same process rolling the rail head into a rod, as rolling the billet into a rod. Here we have "rail" steel; here we have "billet" steel, and if the materials are the same then the resultant bars must surely be the same. There is nothing in the nature of re-rolling in this process. It is true there is a long interval between the two sets of rolling, but when the second set starts it is a "continuation" of the process. It is not a case of re-doing anything, it is a case of keeping on doing it.

Faggot Iron

There is a product on the market known in the trade, and properly designated as "re-rolled." The raw material used is little better than junk, wrought iron boiler tube, stay bolts, pipe, and structural shape scrap. This material is cut into small pieces and assembled in bundles. The bundles are placed in a furnace and heated to a fusing temperature, at which temperature the material becomes soft, sticky and pasty, so that the pieces in the pile fuse together. The piles are drawn from the furnace and are worked back and forth through the rolls until the material is welded together and rolled into bars.

New bars of a perfectly good appearance are turned out, but when cut through and etched with acid almost invariably indicate the lack of proper welding, the presence of seams, with slag and other impurities rolled right into the metal. Tests proved it to be anything but uniform in strength or any other qualities and to be laminated in texture.

The term "re-rolled" was used in connection with this material, commonly designated to-day as "faggot iron," and when rail-carbon steel came on the market, the same term was unfortunately applied, and for this reason many engineers to this day seem to be confusing the two products, which as a matter of fact, are really at the two extremes in the steel bar business.

We have discussed up to this point the history of rail-steel, the raw material, the production of the raw material, the age of the raw materials, the prevailing specifications governing the raw material, its purchase and delivery into the rolling mill.

Physical Properties of Rail-Carbon Steel

Coming next to the physical properties of rail-steel, we naturally go at once to the very complete series of tests carried out under the auspices of the American Society for Testing Materials by Prof. W. K. Hatt, of Purdue University.

This investigation was carried on from September, 1912, to February 1913, for the purpose of "obtaining data upon which to base a reasonable specification." No less than 2,036 samples were taken at unexpected intervals from different representative rail-steel mills throughout the country, varying in size from $\frac{1}{4}$ in. to $1\frac{1}{4}$ in. The following are quotations from the condensed report submitted to the A.S.T.M., with comments thereupon:

"(a) This report covers reinforcing bars, re-rolled from steel rails only."

"(b) Chemical analyses were not considered to be essential or helpful and were omitted."

This might on the face of it, seem rather a startling statement, but is it not true that analyses after all are only aids to hasten the acquisition of physical results?

"(c) The lighter sections were originally rolled about 1885 on the average, while the larger sections were of later rolling, about 1900 or thereafter."

Nine years have passed since this report was written so that these dates to-day would be about 1894 and 1909, which bears out pretty well the average rolling date at which I arrive of 1903.

"(d) The writer believes that the diameter of pin specified for the larger bars is not in correct relation to that specified for the smaller bars. If a bar less than $\frac{3}{4}$ in. calls for a pin of diameter three times the thickness of the test bar with a bend of 180 deg. then the larger bars should bend 90 deg. round a pin of diameter six times the thickness of the test bar. The present specifications, provide a pin of diameter four times the thickness of the bar."

Just why Prof. Hatt came to one conclusion and then wrote a specification much more severe than the conclusion warranted, is not quite clear.

On this question of bending it will be granted by every engineer that it is not good practice to introduce sharp hooks or bends into any structure. In my opinion a $\frac{1}{4}$ -in. bar bent round a 3 in. diameter or a 1-in. bar bent round a 6-in. diameter is about the limit of good practice. Hence any rail-steel bars that have passed the A.S.T.M. specification should without any difficulty at all take the bends required for the structure.

Breakage in Bending

Now some of you may say that it is nevertheless a fact that rail-steel bars do break in bending. This is equally true of high-carbon billet bars, but the reason for the breakage is almost invariably the failure of the individual to recognize the fundamental difference between mild steel and hard steel. Hard steel is not as ductile as mild steel, but I do claim that it is as ductile as is necessary for its particular function. The standard specifications take due cognizance of this in prescribing 3 diameters for the bending of mild steel and 4 diameters for hard steel. But in bending in the field, far too often, liberties are taken that should not be taken, and the operation of bending which is really a skilled operation, is left in the hands of a semi-skilled or common laborer. In my own experience, I have

seen many times bars broken, through the operator being too careless or lazy to change the mandril to a larger size when changing to a larger diameter of bar. Crude bending machines which do not allow the metal to flow freely are too often found on construction jobs, and when a husky laborer and a hustling foreman and such a machine get together, the results are bound to be disastrous.

I have on several occasions asked the question whether it is better to have a bar of especially ductile material like mild steel subjected to these sudden unscientific bending stresses and go into the structure with resultant strain at the bend, or to have a less ductile bar which when subjected to sudden jerking stresses will break and cause the bar to be thrown out of the structure.

The bending of rail-steel and hard billet steel should be done by skilled mechanics, and the cheapest and most effective way is to have the work done in the mill, or have the mill send an experienced man to the job, and if ordinary care is taken, there should be no trouble.

Relation of Bar to Rail Properties

Prof. Hatt's next investigation was into the effect on the physical properties of the steel in the rail as compared with the steel in the finished bar. Tests were made on the steel after each succeeding pass through the rolls, and it was found that the tensile strength increased slowly as the bar was reduced to its final size, but that the tensile strength of the mother rail and the finished bar were within 3 to 4% of each other, the rail generally being a little harder. The variability of the product was also examined carefully, in order to get at the number of tons which should be represented by a single sample bar. Samples were taken for this purpose from three of the mills furthest away from each other and the result was that:

"Ninety per cent of the tests lie within a variation of 15% (plus or minus) of the average and the remaining 10% exhibited an increasing variability up to 30%."

There are two more quotations from this report which I should like to give you before leaving it. They are:

"The nature of concrete is to spread loads and average up physical conditions. It would appear that a greater variability of product is, therefore, admissible than in other steel structures, where a structural unit comprehends a few bars."

"Bars in concrete are protected from sharp impacts and sudden loads, and do not need the same toughness as in other structures. Nor are they subjected to the shop processes that demand a tough material. Large concrete bars are, however, usually bent with a maximum bend of 45 deg., small bars to 90 deg., and at times to 180 deg. Here a certain toughness is required, and the bars receive effective field tests when they are bent."

Effect of Shock

While on the question of sudden shocks, there is another interesting bulletin issued by the University of Illinois. It describes a series of tests carried out by Prof. A. N. Talbot, and his associate, H. F. Gonnemann, on the Western Newspaper Union Building, Chicago, an eight-storey reinforced concrete warehouse, just before the building was wrecked to make way for the Union Station. The reinforcing throughout was rail-carbon steel supplied by the Inland Steel Co., of Chicago.

The tests consisted of loading four panels to 913 lb. per square foot. Stresses in the steel bars were registered as high as 57,300 lb. per square inch, and the report states that, "It is apparent that the yield point of the steel was not reached in even the most highly stressed bars." Numerous cracks appeared in the slabs under these abnormal loads, but the report states: "Upon the removal of the load the cracks closed, giving the slab an appearance similar to that which it had before the load was applied."

Steel coupons cut from bars taken from the tested floor, give an average yield point of 63,600 lb., and an ultimate strength of 101,300 lb.

But the point of real interest was the wrecking of the building after the tests had been completed.

"A heavy iron pear-shaped weight (about 1600 lb.) was dropped on the floor immediately over the column capital close to where the column of the storey above had been. After the column capital had been sheared and shattered by this operation, the portion of the floor surrounding the column, and that directly between columns, was broken up with the weight and with sledge hammers. After the concrete sections of the floor had been removed in this way, the reinforcing bars were cut with the oxy-acetylene flames."

Brittleness Argument Unsound

Surely this test alone is sufficient evidence that the "brittleness" argument is absolutely unsound.

I should like to ask two more questions on which I am still seeking information. The first is, has anyone ever seen a rail-steel bar fracture on a bend without breaking in two? The second is, has any one ever seen a rail-steel bar, once embedded in reasonably good concrete, break through shock?

If the answer is in the negative in both cases, as I firmly believe it is, then why worry about this supposed brittleness.

There are thousands of structures of all classes standing up every day to shocks and vibrations, and built exclusively with rail-steel. I have shown some already, and I might mention among others, the Panama Canal, the Ship Lock at New Orleans, in connection with which I have a letter from General Goethals to the effect that he did not hesitate to allow working stresses to reach a maximum of 20,000 to 22,000 lb. per sq. in.; our own new Parliament Buildings in Ottawa, the large terminal elevator at Port Arthur, etc.

In summarizing, I should like to state that the rail-steel bar to my mind is the strongest bar on the market, and hence the most economical. It demands less tonnage, hence less concrete. The metal is subjected to an exceptionally heavy discard in original manufacture and is subjected to a most critical inspection both physically and chemically in original manufacture. Hence the metal is purer and more uniform than usual in commercial steels. The metal has been subjected to the maximum amount of "work" in manufacture, has gone through an annealing process, and is entirely free from internal stresses. The metal is sufficiently ductile to do its work, and the greater strength obtained far outweighs any extra care required in bending and handling.

WILL BUILD BRIDGES AT ILE PERROT

ALL preliminary arrangements for the construction of the two Ile Perrot bridges which will connect St. Anne de Bellevue with Vaudreuil, P.Q., have been completed and work will start in the early summer, according to an announcement made by T. B. McAuley, president of the Ile Perrot Bridge Commission. The Commission, which has been instrumental in interesting both the Federal and Provincial Governments in the importance of the scheme, will continue to function until the bridges are completed. They were now assured of a grant of \$600,000 from the Provincial Government and one of \$150,000 from the Federal Government. In addition to this the Department of Public Works had loaned the Commission the services of V. Denis, one of the engineers of the department, for the purpose of preparing plans for the bridges.

The results of the Ontario Land Surveyors' annual final examinations, held this year at the Parliament Buildings, Toronto, have been announced. Of nineteen candidates who were examined, the following ten were successful: Alfred Cook, Toronto; O. M. Falls, Toronto; G. C. Hagedorn, Kitchener; W. C. Jepson, Niagara Falls; S. L. Lanson, Toronto; C. T. Smith, St. Catharines; D. G. Ure, Sarnia; F. M. Waddle, Brantford; N. E. Ward, Hamilton and D. H. Weir, Winchester. Gilbert Ward, of Toronto, passed the preliminary examination.

THE USE OF CONCRETE PIPE FOR BUILDING STORM AND SANITARY SEWERS

Views of Municipal Officials Who Have Used Concrete Pipe
— Resists Action of Acids and Gases, and is
Impermeable to Water

By M. W. Loving

Secretary, American Concrete Pipe Association

CONCRETE pipe, both plain and reinforced are now being extensively used for building storm and sanitary sewers. It is not definitely known how early concrete pipe were used for this purpose, but records that are available

FIGURE 1—COMPLETED 72-IN. CONCRETE SEWER PIPE IN VERY HARD SOIL

indicate that they have been giving excellent service since 1873 in many parts of the United States and since 1861 in European cities. The following typical statements of municipal officials who have used this material may be cited as an indication of its permanence.

Fred Davenport, consulting engineer, Kokomo, Ind., on March 30, 1921, stated: "The city of Kokomo is now constructing a large relief sewer system of which I have charge of the design and construction and we will shortly remove some concrete pipe that was placed in 1873. This sewer has been in use as a combined storm and sanitary sewer, and from the inspection I have made of it, it seems to be in first class condition. As this pipe has been in service forty-eight years, it is the oldest concrete pipe that I have seen carrying sanitary matter."

J. L. Temple, Commissioner of Public Works, North Adams, Mass., said on November 10, 1921: "You may be pleased to know that cement pipe was manufactured here in North Adams from 1874 to 1879 and there is still in use at the present time 8-in. and 12-in. sanitary or domestic sewers of this very pipe laid at the time it was manufactured. It shows no sign of deterioration and has proved satisfactory."

H. J. Wiegstein, Commissioner of Public Works, Butte, Mont., stated on November 3, 1921: "We use concrete pipe in all sanitary and storm sewers. Don't know of any failure in concrete sewers in Butte. Some have been used for over 30 years. Concrete pipe preferred in Butte."

J. C. Feeley, Commissioner of Public Works, Rutland, Va., said on September 22, 1921: "We have forwarded three lengths of 8-in. pipe (concrete) that has been in continuous use for a sanitary sewer on River Street in this city for 35 years. Despite the fact that it has been on a 3% grade, where the velocity has been high, you will readily see that this pipe is as perfect to-day as the day it was cast and I would not hesitate to relay it on some of our other streets. This pipe is known as the Ripley concrete

pipe and was made to a considerable extent in 1885. While it has not the strength of modern concrete pipe, as it is made today, with good modern practice, we consider it one of the best demonstrations of the ability of concrete pipe that has come to our attention."

R. W. Wadell, city engineer, Kansas City, Mo., on November 2, 1921, said: "Use both cement and clay pipe for storm and sanitary sewers. Tests are same for both. Concrete pipe has given very satisfactory results."

O. P. Mahoney, Commissioner of Streets and Public Improvements, Joplin, Mo., on November 21, 1921, said: "Just completed 19 miles sanitary sewers sizes 8 in. to 30 in. All concrete pipe tested for percolation and crushing strength. Fully satisfied concrete pipe has no superior for sewer work."

Well-Made Pipe Resists Corrosion

Some municipal and consulting engineers are under the impression that harmful acids and gases may exist in sanitary or domestic sewage that will cause disintegration of properly made concrete pipe. While such might possibly be true of poorly made concrete pipe, it is not true of modern pipe made under the standards of the American Society for Testing Materials. Failures have occurred in sewers of concrete which is also true of every other material that has been used for building these structures. Unless proper precautions are taken to fabricate correctly these units, they, like structures of any other material, cannot be expected to give the best results. This is a matter, however, for the engineer to take care of.

Domestic or sanitary sewage usually follows the reaction of the water supply and is slightly alkaline. Occasionally some manufacturing waste may be found which from the nature of the manufacture is slightly acid. Some of the most competent consulting engineers of the country contend that such wastes, when discharged into the laterals

FIGURE 2—TESTING A Y SECTION WITH 160 LB. MAN ON END OF 7 FT. LEVER WITH 5-IN. PULCRUM

or interceptors are generally so small in volume that they are promptly neutralized by the alkalinity of the sewage.

Sewage contains sulphates, nitrates, chlorides and other salts in solution which are not acids. Analyses of sewage in many American and European cities are presented in Metcalf and Eddy's "American Sewage Practice," Vol. 3, and George W. Fuller's "Sewage Disposal." From an examination of these analyses it can readily be seen that practically all of the sewage analyzed gives a slight alkaline reaction.

Studies in connection with the treatment of sewage in Chicago and Baltimore have brought out the fact that the sewage has shown a consistent alkaline reaction for many years. T. C. Schaetzle, principal chemist and bacteriolo-

gist of the Baltimore sewage treatment works, has found that the sewage treated at that plant has shown a slight alkaline reaction for the past seven years. The Baltimore sewerage system is of the separate type so that the sanitary sewage is probably as concentrated as in any American city.

Opinion of Sanitary Engineers

To emphasize the durability of concrete for sewer construction, the following typical statements of two prominent sanitary engineers who have wide experience in sewer design and construction are presented:

Dr. Rudolph Hering, consulting engineer and sanitary expert, of New York, says: "We have plenty of cases in which cement concrete has been used for sewers, extending over a great many years, not to refer to the old concrete sewers of Rome and London, on which I have no detailed and satisfactory information. I know that the large sewers in Paris have been built of rough stone heavily plastered and smoothed with cement so that the sewage flows over the cement surface in the same way as if the entire mass were of concrete. These surfaces at my examination in Paris were quite good. There had been no disintegration. I laid this fact to the density and smoothness of the plaster.

FIGURE 3—LAYING 78-IN. REINFORCED CONCRETE SEWER PIPE.

In 1881, I closely examined the concrete sewers in Vienna, where many had been built both of large and of medium size. The work had been very carefully done and the sewers had been built from 10 years to 20 years. The sewage is rather strong in Vienna, because the water supply per capita is unusually small. I found no disintegration of the concrete surface, which then looked dense and smooth."

T. Chalkley Hatton, chief engineer, Sewerage Commission, Milwaukee, Wis., says: "I have been building concrete sewers since 1893. I have had charge of the operation of these sewers up to 1906, during which time I have had occasion frequently to pass through them for examination and inspection, and have never seen any visible effect upon concrete exposed to sewage or sewage gases which might have resulted from the action of the sewage, and I am of the opinion, broadly speaking, that if the concrete is of the proper character, built and placed in the proper way

—that is, a dense enough mixture and properly mixed—the ordinary sewage or sewage gases generated from an American city will have no effect whatever upon the concrete."

Concrete pipe is highly impermeable to water, thus reducing leakage and infiltration to a minimum. Its permanence and smooth interior are distinct advantages from the standpoint of design and economy. The outstanding features of plain concrete pipe are its great strength, smooth interior, permanence and low percentage of absorption. The concrete used for fabricating such pipe is of a dryer consistency than that used for reinforced concrete pipe, but in this case the concrete approaches the ideal consistency that gives maximum strength. Also, the pipe is produced by machinery in which the concrete is placed under enormous pressure, thus compacting the mass and making possible very low percentage of absorption. Figures 1, 2 and 3 illustrate the use and testing of modern concrete sewer pipe.

ADDRESS ON GOOD ROADS BEFORE OTTAWA BRANCH ENGINEERING INSTITUTE OF CANADA

BEFORE an audience composed largely of engineers and civic representatives, George Hogarth of Toronto, chief engineer of the Department of Public Highways of Ontario delivered a most interesting address on "Our Public Highways" at Ottawa on February 16. The lecture which was given under the auspices of the Ottawa branch of the Engineering Institute of Canada, was illustrated by some 150 lantern slides as well as two motion picture films. Mr. Hogarth, who was introduced by K. M. Cameron, the chairman of the Ottawa branch of the Institute, dwelt on the course of road-building in Ontario, from the revival of five years ago, to the present time. Mr. Hogarth then proceeded to discuss the need for improved roads in Ontario and how this improvement was brought about.

The lecturer pointed out that the development of the motor car created the necessity for good roads, and these developed with the development of motor vehicles. He outlined the various types of roads in Ontario. There was first the township road, which was of various types. Some of these township roads had been taken over by the county as county roads. Some near cities had been taken over by suburban road commissions. On such as were still township roads the government paid 20 per cent. towards the cost. The roads were usually of earth and gravel and were frequently narrow, as they did not represent main travelled thoroughfares. Of the total township roads of a few years ago the Ontario counties had now assumed about 15 per cent. as county roads. On these latter the government paid 40 per cent. of the rebuilding and maintenance. Then there was the still higher type of county provincial roads which were constructed of all materials so far from earth and gravel to concrete. On these the province paid 60 per cent.

In 1918 the Ontario government took over the Ottawa-Prescott road. At that time it was a narrow and winding trail. Now in three years it had been graded, surfaced, and one day last fall, on an inspection trip, the inspecting party went over the 58 miles from Ottawa to Prescott in 2 hours.

The Ottawa-Prescott road had been built, but had not yet been paved or permanently surfaced. There were heavy grades on it and in some cases these had sunk anywhere from six inches to several feet. These places will be filled up this summer, but the road will take another year to settle to its permanent place. Then it will be surfaced where necessity demands.

The Ottawa-Point Fortune road had now been paved for 21 miles and another year would see all the culverts, etc., in good shape. The Ottawa-Kingston road had progressed some, but there were stretches of this road which were not very largely travelled and it would be some time yet before all the culverts were phased. Progress was being made on the Ottawa-Pembroke road, culverts were being constructed and a base course has been put on Carling avenue.

HYDRAULIC EQUIPMENT AS AFFECTING POWER HOUSE DESIGN*

Marked Increase in Turbine Efficiencies — Present Tendency is to Increased Speeds — Features Affecting Installation of Main Units and Auxiliary Equipment

By Max V. Sauer

Hydraulic Engineer, Ontario Hydro-Electric Power Com.

THE modern hydraulic turbine has been developed to its present state through an interesting cycle. The earliest type consisted of a single runner, mounted on a vertical shaft and was usually set in an open flume, with no provision made for directing the water to the runner or for discharging it away from the runner. With the application of turbines to driving electric generators, the necessity at once arose for larger capacities and higher speeds, not to mention the requirements of regulation. This resulted in the development of the multiple runner type, sometimes on a vertical shaft but more usually on a horizontal shaft. Installations are known where as many as eight runners were mounted on one shaft. As speed regulation became more important the multiple runner type presented serious complications due to the fact that regulating gates for all the runners had to be connected together and the system became very cumbersome and complicated. Even with this type not much attention was paid to a proper distribution of the water to and from the turbine, and while there were several installations with efficiencies in the neighborhood of 80%, this was the exception rather than the rule. The necessity of obtaining larger capacities while, at the same time maintaining the turbines free from complications has led through various steps to the present type of high capacity high speed turbine consisting of a single runner mounted on a vertical shaft with the water led to the runner through a spiral case and away from the runner through a well designed draft tube.

The final development was delayed for some time on account of the difficulty of providing a dependable vertical thrust bearing. While the oil pressure type was fairly satisfactory the system was complicated and subject to frequent failures. These difficulties are now overcome and at least three satisfactory types are on the market.

Remarkable Increase in Efficiencies

Since the year 1900 the efficiencies of turbines in general have been advanced to a remarkable degree. Twenty years ago 80% maximum efficiency was considered to be the last word in turbine installation while today there are several plants in which the turbines are operating at from 90 to 93% efficiency.

This great advance in efficiency is not due alone to improvement in runner design, but can be accounted for in great part by the more careful proportioning of the spiral casing, the reduction of clearances between the runner and the casing, and the improvements in the design of the draft tube discharging water from the runner to the tail race. The flow of water from the entrance of the scroll case to the discharge at the tailrace is now accomplished without any abrupt changes, resulting in freedom from eddies and consequent loss of power.

With the present high efficiencies attained it can be readily seen that further increases will not be forthcoming except by very small increments. The present tendency is to develop a runner of higher specific speed without at the same time a sacrifice of efficiency. That progress has been made along this line is shown by the fact that the specific speed of the turbines in one of the Niagara Falls plants erected ten years ago is 20 while that of the new Queenston-Chippawa Development operating under a higher head is 34. The demand for higher speeds on large

capacity low head turbines has been brought about by the great saving in cost in the generators, and the turbine manufacturers have now developed a still higher speed type of runner to meet these conditions.

Application to Power House Installation

Where the type of turbine for any given development has been fixed the next consideration in power house design is the number of units to be installed. As a general rule they should be made as large as possible so that their number may be kept to a minimum on account of simplification of operation and lower initial cost.

There are always other features however which may modify this general consideration. For example, in an isolated plant (i.e. one not connected with other plants) the number of units should be not less than three, and in many cases four, so that sufficient flexibility of operation may be obtained and also because a failure in any one machine will not tie up too great a proportion of the plant.

Another feature that usually affects the number of units is the fact that only a portion of the plant is installed initially, on account of the load requirements being smaller than the ultimate capacity.

In a large installation where the above considerations do not apply to any great extent the following example indicates the method of procedure in the determination of the size and speed of the individual units.

Assume a development of 60,000 h.p. at 50 ft. head. First assume an installation of five units of 12,000 h.p. each. An examination of performances of modern turbines shows a generally average ratio existing between specific speed and head, as follows:

Head	Specific Speed
20	100
50	75
100	52
200	39
300	33
500	27
600	24

The fundamental expression for specific speed is $K = \text{R.P.M.} (\text{H.P.})^{1/3} / H^{3/4}$, where K is the specific speed, R.P.M. the revolutions per minute of the turbine, H.P. the horsepower developed, and H the operating head.

From the above tabulation it will be noted that a specific speed in the neighborhood of 75 is correct for the unit under consideration.

Hence, $\text{R.P.M.} = 75 (50)^{3/4} / (12,000)^{1/3} = 91$.

If the frequency of the plant is 60 cycles per second the nearest synchronous speed to this is 90 r.p.m. which would satisfactorily meet the conditions. It would require an 80 pole generator, however, and it would probably work out more economical to reduce the units to 10,000 h.p. each. This would require six machines operating at 100 r.p.m.

For high heads with relatively small output this analysis will indicate speeds in excess of the best practice. For example it would show a speed of 820 r.p.m. for a 6,000 h.p. unit under 600 ft. head. Such a speed is almost sure to give trouble after a short period of operation as the slightest unbalance will set up dangerous vibrations which become aggravated as time goes on with the result that the units require frequent overhauling with consequent loss of time in service. Generally it is not advisable to operate turbines of capacities in excess of 1,000 h.p. at a higher speed than 500 r.p.m.

Auxiliary Equipment

The auxiliary equipment in any plant plays a most important part in its output from the point of view of regulation and of that ideal of all operators — continuity of service. It must be installed with two vital objects in mind: ease and convenience of operation, and absolute dependability under all emergencies. This latter condition can be attained in many cases only by duplication of the apparatus.

*Paper read at Water Power Symposium, University of Toronto, Feb. 28, 1922.

Under the classification of hydraulic auxiliary apparatus is included:

1. Service units.
2. Governor pressure system;
3. Penstock valves.
4. Lubricating system.
5. Service water supply.
6. Drainage.

The governors are not included as they are essentially part of the turbines.

The service units must be in duplicate since they are the source of power for the plant equipment such as emergency excitation for the main units, the governor pressure pumps, the lighting system, flood drainage pumps, travelling cranes and repair shop machinery.

A major interruption may shut down the whole plant and in order to get back on the load without delay, service from the governors and exciters must be immediately available. For this reason one service unit at least should be independently turbine driven. The layout requires as much care and attention as that of the main units and it is an unfortunate fact that auxiliary equipment is frequently installed in a manner which indicates a lack of appreciation of its vital function. The unit should be completely independent in that its own governor pressure system should be separate from the main system with provision for interconnecting with it.

For supplying pressure fluid for governor operation two systems are available and as both give satisfactory results it is a difficult problem to determine which to install in any given development. The first, or multiple unit system, consists in having a separate pump and sump tank for each unit, and the second, or central system, in having the units connected through headers to a central pump.

For security of operation the multiple system is tied together with a header on the pressure side provided with sectionalizing valves so that in the event of failure of any pump, the governor for the unit can be connected to the header and supplied by the other pumps in the system. To provide against failure in the central system a duplicate pump is installed which can be thrown into service should the first pump fail. A duplicate system of headers is also frequently advisable.

Multiple Unit System

The advantages of the multiple unit system are, first, its greater flexibility, and its simple application to an initial partial plant installation. As the plant grows individual pump units can be added as the turbines are installed, and in this way the system is always complete in itself. Another advantage is that the failure of one pump unit does not in any way cripple the service, since with all the units being tied together the remaining pumps in the system will easily take care of the disabled unit. The main disadvantage of a multiple unit system is found in the fact that a great proportion of the operating attention is required for the maintenance in service of a number of small units. Multiplicity of pumps means more failures of small parts with a consequent danger of an insignificant failure being responsible for the shut-down of a main power unit.

Central Pumping Station

The advantage of a central pumping system lies in the simplicity of the lay-out, with few parts to give trouble and with concentrated operating attention. Furthermore, since the operating fluid for the whole plant is handled by one pump, this pump is necessarily of large capacity, resulting in a rational design and one of much better operating characteristics. The pump in the central system is therefore usually of the multiple stage, centrifugal type, which is ideal for the varying load conditions imposed by governor service. In the multiple unit system the pump capacities are not large enough to permit satisfactory centrifugal designs, with the result that they are usually of the gear or plunger type, and consequently noisy in operation.

The main disadvantage of a central system lies in the fact that for partial plant installation the layout is unbalanced and of too great capacity for the few number of units initially installed. If the pump is automatic, electrically controlled the small output demanded results in frequent starting and stopping with consequent wear and tear on the motor; or if operated continuously through pressure regulating devices the governor fluid becomes very hot.

With the use of centrifugal pumps it has been found that oil as a pressure medium is not satisfactory, owing to the emulsification due to the churning action of the pump. For this reason water treated with one or two percent of a soluble oil or a small amount of bichromate of potassium is now used and is found to operate successfully. Water thus treated acts efficiently as a lubricant in the working parts of the governor and has no tendency to produce rust.

There is a tendency in the present pressure systems to design the operating cylinders on the turbines to work at lower pressure than formerly; where in the older plants this pressure was from 200 to 250 lbs. it now ranges in the modern developments from 135 to 200 lbs. This results in much less trouble from wearing of the valve seats and leakage in pipe connections.

In the older type smaller capacity turbines the emergency control in the event of governor failure could always be had by throwing the turbine gate mechanism directly over onto hand control. As the capacities increased this direct hand control became too cumbersome and difficult to operate owing to the large masses in the gate mechanism which had to be moved. Hand control was then obtained by simply switching over from governor control to hand control of the pressure operating the governor cylinders. Such an arrangement however still left the control of the unit dependent on the maintenance of the governor pressure system, and if this failed control of the unit was practically impossible. In plants where the head is 200 feet or more it is therefore advisable to connect the governor pressure system direct to the penstocks, thus permitting penstock pressure to operate the governor in extreme emergency. Where the head is lower than 200 feet and in consequence not sufficient to operate the regulating cylinders the only recourse left is to install hand pumps directly on the regulating cylinders. With such an arrangement the machine can be shut down, but it necessarily takes a considerable length of time.

HAMILTON ENGINEERS HEAR ADDRESS ON STANDARDIZATION

AT A meeting of the Hamilton branch of the Engineering Institute of Canada held at the Royal Connaught Hotel, an address on "Standardization" was delivered by R. J. Durlay, secretary of the Canadian Engineering Standards Association. There was a good attendance of members of the Institute, as well as purchasing agents and other employees of local manufacturers. The address was largely technical, but was made interesting as well as instructive by the introduction of the personal element and illustrations of what had been accomplished by research work during the great war, particularly by the aircraft board of Great Britain. Greater advancement has been made, he said, in Europe, in the standardization in machinery work than in America, the Swiss and Germans leading in the movement for interchangeable parts and in the simplifying of the work of tool cutting and making. In America the automobile engineers have done much in the matter of standardizing in the steel industry.

A project to develop one million horsepower from the Lachine Rapids has been abandoned indefinitely owing to the insolvency of the Lachine Rapids Power Co., sponsor of the scheme. It was proposed to build a dam across the St. Lawrence from a point 300 ft. east of the present plant of the Montreal Light, Heat & Power Co. to Heron Island and thence to a point immediately opposite.

ROAD-BUILDING IN ONTARIO*

Some Notes by a Well-Known Visitor from the United States — Comparisons with Mileage and Practice in That Country

By Prevost Hubbard

Chemical Engineer, The Asphalt Association

ALTHOUGH I have not had a chance to study the development and present status of highway work in Ontario, from what I have heard and understand to be the present situation, I believe the province is to be congratulated on what has already been accomplished and upon the future possibilities which are directly dependent upon the work it has already done.

The Deputy Minister of Highways informs me that there are in Ontario to-day some 27,000 miles of hard-surfaced roads, which is nearly 10% of the present total mileage of such roads in the United States. According to the latest data that we have been able to secure, we have estimated that on January 1, 1920, there were in the United States, outside of municipalities, about 256,000 miles of roads of a higher type than earth or sand-clay, and the mileage to-day is probably not much greater than 275,000. The area of Ontario is about 11% that of the entire United States, and its population less than 3%. It, therefore, appears that Ontario has almost as much mileage of hard-surfaced roads, per unit area, as the United States, and per unit of population about three times as much.

In the adoption of improved types of highways higher than gravel and macadam, I believe, we in the United States are still in the lead, as we estimate that about one-fifth of our hard-surfaced country roads are of these higher types, while the same is true of considerably less than three per cent of the roads in Ontario. While gravel and macadam roads are not as permanent in character as the higher and, for first cost, more expensive types of highways, they are undoubtedly the most economical to adopt up to a certain traffic limit. They, therefore, constitute an extremely valuable asset to the community which they serve, and represent an investment well worth conserving. Such a policy of conservation has I understand been adopted by the present Provincial Highway Department. When developing a system of heavier traffic highways, in many cases it becomes possible to utilize the existing gravel or macadam roads, so as to make their replacement value practically a permanent investment.

City Paving Practice Should Not Be Overlooked

It may be of interest to review a few facts in connection with the development of the heavier traffic highway systems in the States, and in this connection the experience and practice of our cities should not be overlooked. To me it is an almost incomprehensible fact that in building our state and county highway systems more weight has not been attached to paving practice in our cities where many of the problems of meeting heavy and varied traffic conditions were successfully solved before such conditions made their appearance on country and suburban highways. In our cities the original waterbound macadam and gravel roads have for the most part given way to higher types of construction until to-day they constitute an average of only about 26% of the total yardage. The three most widely used city types are asphalt, brick and stone block. If we eliminate the waterbound pavements we find that of the higher city types asphalt constitutes about 55 per cent, brick about 19 per cent and stone block about 14 per cent, giving a total of 88 per cent of these three types.

In connection with the preponderance of asphalt pavements, the present trend of paving practice in the constructive modern brick and stone block pavements is of considerable significance, as it recognizes a principle which just now

is attracting a great deal of attention on the part of our highway engineers. I refer to the use of a flexible joint filler for brick and block pavements as against the rigid grout fillers formerly so popular. Such cities as New York and Philadelphia are now using asphalt fillers for heavy traffic streets paved with stone block, and both the Paving Brick Manufacturers' Association and the Association of Stone Block Manufacturers are preferentially recommending asphalt as a filler for their respective types of pavements. The reason for this lies in the fact that absolute rigidity in a pavement structure is not a desirable characteristic. Service results and comprehensive field tests conducted by the U. S. Bureau of Public Roads have demonstrated that the brick or block pavement with a flexible filler is more resistant to traffic than with a rigid filler. A certain degree of flexibility is highly advantageous in meeting the heavy impact of modern traffic. Such flexibility is an inherent characteristic of bituminous pavements and is imparted to brick and block pavements when asphalt is used as a joint filler.

Flexible and Semi-Flexible Types of Construction Predominate

While in certain sections of the country the experience of our cities appears to have been overlooked, it is a fact that the flexible or semi-flexible types of construction predominate in our country roads and if we consider the total mileage of state, county and municipal highways higher than gravel and macadam, considerably more than 50 per cent may be classed. By reducing all yardage to a basis of 16-ft. width, we estimate that at least 45 per cent of the mileage of the higher types of pavements are of the hot-mix asphalt types. Our latest available information indicates that last year the total area of asphalt pavements constructed approximated 68,000,000 sq. yds., which was greater than for any other type. Most of the stone block pavements constructed that year were filled with bituminous material and we are informed that about 60 per cent of the brick pavements were similarly filled.

There are, it is true many advocates of the all rigid monolithic types of construction and in certain sections such pavements predominated in last year's work. This is not true, however, of the country as a whole. Those who favor rigid construction have constantly been obliged to increase the massiveness of design of such pavements, and also the amount of reinforcement, in an endeavor to successfully meet the destructive action of heavy traffic, while those who favored the semi-flexible or flexible types have in general found that the old standards of design have proven satisfactory. The all-flexible types, such as the black-base pavements so extensively adopted in our far-western states, appear to be the most highly resistant per inch of total thickness, and may therefore be considered the least massive, and in this respect the most efficient, of the heavy traffic pavements.

It is probable that such pavements will be given considerable attention in the 1922 program of some of our eastern states owing to the remarkably satisfactory results obtained over a long period of years in the west. Many of these pavements are 6 in. or less in total thickness.

What we have learned in the past few years about the destructive affect of traffic impact and the resistance to impact offered by semi-flexible and flexible highway structures has a peculiar significance in connection with a great economic problem that of conserving our investment in old roads, particularly gravel and macadam, when it becomes necessary to adopt a higher type of wearing surface. Prior to the careful investigation of this important subject there existed a marked and growing tendency to discredit the use of old gravel and macadam roads for foundations for the higher types, and this in spite of many remarkable service records of macadam foundations.

For example, in the city of New York a number of the most heavily traveled streets were constructed years ago on macadam foundations and some are still giving satisfactory service. In 1890 Broadway between 59th and 79th streets was paved with asphalt over an old macadam base

*Address delivered March 1, 1922, before the Ontario Good Roads Association, Toronto, Ont.

and for 22 years gave good service. Its replacement at the end of this period was largely due to subway excavations. Paved in a similar manner, 72nd St. gave 22 years of service under increasingly severe traffic conditions, and the same is true for a 19-year period for Fifth Ave. between 110th and 120th streets. Lennox Ave. between 110th and 124th streets was surfaced with asphalt over old macadam in 1904 and is still giving good service. The cost of maintaining this section in 1919, or 14 years after construction, was only 1% — certainly a remarkable record. I have mentioned these few examples, only for the purpose of illustrating the point. Many similar cases might be cited from various localities.

A recent investigation of rolled stone bases for brick pavements was conducted by the U. S. Bureau of Public Roads, and A. T. Goldbeck, of that Bureau, has published a very favorable report on this type of brick construction. All in all it appears that the old waterbound base is again coming into its own.

Methods of Sub-Grade Preparation Improving

One reason for much of this former dissatisfaction with such bases was undoubtedly due to a fault which has been all too prevalent in the rapid development of our country highway systems. I refer to inadequate preparation and drainage of our sub-grades, fostered by the false idea that the cost of such work would make the total cost prohibitive. Political pressure and popular demand for the rapid construction and greatest possible mileage of improved roads for a given amount of money, was to a great extent responsible for this state of affairs. I am pleased to say, however, that this subject is receiving an increasing amount of attention and is being most carefully investigated by the U. S. Government and a number of public service bodies and technical societies, the work of the various organizations being correlated by the Advisory Board on Highway Research of the National Research Council. I believe that most of our highway engineers are now fully alive to the importance of this subject and that marked improvement in our present practice of sub-grade preparation and drainage will shortly follow.

Others frequently see our faults before we, ourselves, fully realize them. W. A. McLean tells me that for a long time he has believed that the failure or unsatisfactory condition of many of our highways is due to their having been constructed in one operation, and that much of our sub-grade troubles can be attributed to this fact. I think I can fully agree with him in this matter, particularly in view of our lack of information on sub-grade conditions prior to construction. Without such information rapid development of a higher-type highway system is almost sure to result in many costly failures.

I understand that the present policy of the Ontario Highway Department is, where new construction is contemplated, to grade the roads a year in advance of surfacing; then where traffic conditions do not immediately demand a higher type, to surface these roads with gravel and macadam, with the ultimate idea of utilizing such roads as foundations for more resistant wearing courses when they become necessary. I believe this policy to be thoroughly sound as it gives opportunity for hunting out and correcting all existing sub-grade troubles before the more expensive surfacing is laid. Such a policy may, and I understand has, caused some dissatisfaction on the part of those who are over-anxious to see and travel over the completed highways at the earliest possible moment, but I believe the great mass of the people may be educated to appreciate the fact that this policy ultimately means more and better highways for a given amount of money.

Thickness of Old Roads Often Overestimated

From what I have gathered during my short visit, it appears that ultimately a considerable portion of the higher-type roads in Ontario will have a macadam or gravel base, and in conclusion, I wish to call attention to just one other matter which has been a very common fault in our work and has often resulted disastrously. This is

the over-estimation of thickness of the old road when it has been decided to utilize it for a foundation. All too frequently we have laid an expensive pavement on an old road actually three inches or less in thickness, when it has been estimated as not less than 6 or 8 inches thick. Macadam and gravel roads wear away very rapidly in comparison with other types, and because records show that a large tonnage of road metal has been used in the construction and maintenance of the old road, it does not by any means follow that most of such material is still on the road. It is very essential, therefore, to determine accurately the existing thickness of the old road before utilizing it as a foundation.

I believe that wherever possible the old road should be left undisturbed rather than to scarify and reshape it, which destroys much of the stability that compression under traffic has brought about. It is quite necessary that the old surface be trued up before the wearing course is laid; but if the reconstruction is to be completed in one operation, the placing of the bituminous mixture in existing depressions will usually prove to be the best practice. If the existing road is not sufficiently thick to serve as a foundation, it may conveniently be reinforced with a thin course of black-base mixture before the wearing course is laid.

ZONING OF BUILDINGS UNDER TOWN PLANNING

ZONING of buildings in cities was the subject of an address by W. E. Hobbs, Manitoba provincial town-planning controller, to the members of the Manitoba Association of Architects at Winnipeg. "Zoning," said Mr. Hobbs, "is the creation of 'use districts.' Under present conditions, there is nothing to prevent the intrusion of an apartment block or a store into a residential district. Similarly, there is nothing to prevent a factory or other undesirable use of land from intruding itself into a shop and office area. Industries of an objectionable nature may go anywhere so long as the land can be purchased. This results in depreciation of property values in the vicinity of the intrusive occupation, and, in some instances, where undesirable occupation becomes marked, the occupiers of property leave the district, and in some cases, property values drop so that there is not only a personal loss to the owners of the land affected but, by the reduction of values, the assessment also drops, and therefore a smaller amount in taxes is collected.

"To prevent this, and to stabilize conditions, zoning has been resorted to by many cities on this continent, and also in Europe. There are three factors in a zoning or distributing scheme. First is the defining of the boundaries of 'height areas.' In those areas the maximum height to which buildings may be erected is fixed, usually in terms of the width of the street upon which such buildings face. In New York, these areas are classed as 2½, 1½, 1¼, etc.; the numbers refer to a multiple of the width of the street with 100 ft. as a maximum and 50 ft. as a minimum.

"Then there is the defining of the areas in which the percentage of the lot upon which the buildings may be constructed is prescribed. These percentages usually vary from about 100 per cent. to a minimum of 30 per cent., the larger percentages being applied in business areas and the smaller in residential areas.

As fixing the height and area of a lot which may be occupied by a building does not prevent any occupation of a building objectionable to other occupants in the vicinity, it is also necessary to prepare a third map which defines the boundaries of areas of the properties within which have a uniform base. Thus residential, commercial, industrial and other buildings are kept within their own boundaries and cannot encroach upon each other. The boundaries of the areas for height built upon area and use do not necessarily coincide with one another.

"Winnipeg is very much in need of a zoning scheme, particularly if industries are to be attracted to the city, and it should be in the interests of the citizens as a whole to institute such a scheme."

CONCRETE BRIDGES AND CULVERTS*

Formulae Used to Determine Size of Structure — Type of Construction to Suit Conditions — Loading Considerations — Peculiar Features of Different Foundations

By W. J. Moore

Highway Engineer, County of Pembroke, Ont.

BRIDGES and culverts are necessary in the construction of highways in order to permit the safe passage of traffic over streams and ravines, and the flow of streams under the highways. In this latter connection there may have to be taken into consideration the designing of a waterway suitable for navigation or for the driving of logs in lumbering operations, as well as one suitable for the maximum flow of water which may occur.

Examination of Site

The first essential towards the construction of a new bridge or culvert is a proper examination of the site. A survey should be made taking in a strip fifty or more feet on each side of the centre line of the highway and for as great a distance along it as can possibly be affected by the construction of the approaches. Levels and measurements should be taken along this strip sufficient to make an accurate contour plan. If there is an old structure there, it should be measured up and enquiries made as to whether it has been of sufficient capacity to accommodate the stream at flood-times. High and low water marks should have their elevations determined and a cross-section of the stream bed should be taken along the centre of the highway. Soundings and borings should also be taken to determine the character of the foundation. This is a very important part of the work and is too often neglected, the consequences being frequently disastrous.

Area of Waterway

In the design of culverts a contour plan should be made of the strip of land previously surveyed and also a profile of the centre line of the highway for some distance on each side of the site. On these should be marked most of the information acquired during the survey. The next step is the determination of the area of the waterway. This may be done in one of three ways, viz., theoretically, empirically or by observation, and in so doing there are several factors which should be taken into consideration.

In the first place, the size of the opening will depend on the amount of rainfall, which amount will be the maximum amount of rainfall for the time required by the run-off to reach the culvert from the most distant part of the watershed. For example, if it is found that it required 30 minutes for the rainfall from the farthest point of a drainage area to reach the culvert, then the area of the waterway should be designed for the maximum rainfall for 30 minutes as observed for the district in question. The figures for maximum rainfall for various districts may be obtained from the Meteorological Service of the federal government. I have been the observer at Pembroke for about ten years, and the maximum storm during that time has been a rainfall of 1.90 in. per hour for a period of 35 minutes.

Not all of the rainfall on an area reaches the outlet, and the portion which does is known as the run-off. The amount of run-off is affected in various ways. The watershed may be long and narrow and covered with dense vegetation, and hence the flow of water may be retarded; or the soil may be of a sandy and porous nature and hence absorb more of the rainfall than if it were clay. Then again, in a northern country, it is possible to have a rainfall on snow accompanied by a thaw and the conditions in addition to the fact that the ground is frozen and practically impervious may give rise to a maximum rate of run-off.

In a theoretical determination of the area of a waterway, many assumptions would have to be made regarding the points mentioned above and the area arrived at by the use of the formulae for the flow of water in open channels. This is a laborious method however, and owing to the many doubtful factors is hardly worth the trouble involved.

Empirical Methods

There are then the empirical methods by which certain formulae are used which have been devised from experience. Chief among the formulae are Myer's and Talbot's. These are as follows:

Myer's, $A = C$ (Drainage area in acres)^{1/2}

Talbot's, $A = (\text{Drainage area in acres})^2$

where A is the area of the waterway in square feet and C is a coefficient varying with the character of the watershed.

Probably the best method, however, is by observation of the flow through existing structures and by enquiry from persons residing near the culvert. In railway practice before the days of the N.T.R. on which permanent structures were built at once, it was the custom to build temporary wooden culverts of ample dimensions. Each year the high water mark was observed and painted on the walls. In this way, after a lapse of eight or ten years when the life of the temporary structure had expired there was reliable data as to the size required for the new permanent culvert. Highway engineers are mostly concerned with roads which have been in existence for years and culvert or bridge work generally consists of replacements of existing works, consequently much information may be acquired by observation and enquiry. Should the culvert be situated on a new location there will, no doubt, be other structures on the same stream either above or below the proposed work, observation of which will give all the data required.

Culverts

The particular type of structure for a given location, is called a bridge or a culvert, arbitrarily in accordance as to whether the span is over or under fifteen feet in width. If a culvert is required, it may be either a plain or reinforced concrete arch or a box culvert. Arches are chosen where the head room is sufficient for this type and where it is thought that a more pleasing effect may be obtained by their use. Box culverts are, however, used more generally due to their suitability for sites where headroom is restricted and to the fact that the form-work on them is not so complicated, as well as for the reason that the load is more evenly distributed on the foundations and less care need be exercised on this account.

Box culverts may be either open or closed boxes. In the former there is not a concrete floor and the load is carried on footings beneath the side walls, while in the latter there is a reinforced concrete bottom which is designed to carry the load.

The length of culvert depends on the depth of the fill on top of it. Assuming the slope of the fill to be $1\frac{1}{2} : 1$, then the length of the culvert will be the width of the roadway plus three times the depth of the fill over the top of the culvert.

Loadings

Loading on culverts is generally considered to be the total weight of the fill above it for the full width of the excavated trench. No allowance is made in fills less than 30 ft. deep for the arching of material above the culverts. In addition to this is the weight of the culvert itself which is generally figured as equal to a like volume of the superimposed earth.

Lateral pressure on the sides of the culvert is generally assumed as one-fourth of the pressure on top. The live load surcharge is added to the top soil pressure in designing top and bottom slabs. The top and bottom slabs are designed as simple beams supported at the ends but not fixed. Reinforcement in them is generally about 1% of the total section. The transverse reinforcement is the most important, but longitudinal reinforcement is also used, as due to un-

*From a paper presented at the Eighth Annual Conference on Road Construction for County Road Superintendents and Engineers, Toronto, Feb. 27.

equal settlement, the culvert as a whole may be subjected to beam stresses. The side walls are frequently not reinforced but are made of ample dimensions to resist the lateral pressure.

The bottom slab is generally of the same thickness and reinforcement as the top but in this the reinforcement is placed near the top whereas in the top slab the reinforcement is placed near the bottom.

End walls on culverts may be of three or more kinds. Some are built as continuations of the side walls with a slope equal to the slope of the bank, some are built at right angles to the barrel of the culvert, while others are built at an angle of 30 or 45 deg. with the side walls. The choice will be controlled by the desirability of providing a clear flow. They should be designed of sufficient weight to resist the overturning effect of the bank behind them and to resist the impact of all kinds of vehicles.

Concrete Bridges

In recent years, more and more reinforced concrete bridges are being built. The following are the kinds usually recommended for various conditions:

- (1) A concrete arch or concrete abutments with reinforced concrete slab top for spans up to 20 ft.
- (2) A concrete arch or a concrete beam bridge for spans from 20 to 40 ft.
- (3) Concrete arch for spans exceeding 40 ft.

Concrete truss bridges have also been used somewhat in recent years.

Arch bridges may be divided into open spandrel and closed spandrel bridges. In open spandrel bridges the load is carried on a system of beams and columns which rest on the arch, while in closed spandrel bridges the spandrel walls are built solid as retaining walls to confine the filling over the arch. Arch bridges are also classified according to the form of the arch as circular, multi-centered, elliptical or parabolic.

In a paper such as this it would be impossible to go thoroughly into the design of the different kinds of concrete bridges. It is sufficient to say that they should be designed by competent men and carefully supervised in construction. A point that should be emphasized, however, is that it is especially essential to have a stable foundation. Of all the failures of bridges that are recorded, by far the greatest cause is the neglect of attention to this rule.

Foundations

Foundations for bridges are either natural or artificial. Natural foundations are (a) Rock, (b) Gravel, (c) Sand, (d) Clay. The allowable pressure per square foot to which the different classes may be safely subjected may be found in any good handbook.

Rock is generally a satisfactory foundation, but sometimes owing to the formation it is inadvisable to build upon it until it is levelled off or cut into steps.

Gravel is a good foundation, but it is necessary to be sure that the stratum is sufficiently thick. Gravel may also be washed out from around a pier causing its failure. In the county of Renfrew this happened in two instances during the past summer to bridges on the Madawaska River. At Stewartville, a central pier was undermined by the action of the swift current, turned partly over and distorted the trusses on the adjoining spans. At Griffith also a similar thing happened. It is necessary therefore in locations such as this to carry the pier down a sufficient depth and if necessary to protect it by a rip rap, a concrete apron or otherwise.

Sand varies from the coarse variety to quicksand, which is probably the most annoying material to work with that exists. Piling is generally resorted to where this occurs, sheet piling being frequently used.

Clay also varies from the firm variety almost approaching shale in its characteristics to a wet soupy material as unstable as quicksand. Sometimes in clay the strata are inclined steeply and a subsidence takes place which spells disaster. This occurred a few years ago at a bridge over

the Madawaska River in the Township of McNab and known as the clay-bank bridge. A shore pier carrying the ends of two girder spans was overturned by a slide of the foundation material.

Artificial foundations may be either of piles, grillage or cribwork. Of these the use of piles is the most universal and satisfactory. Piles may be of almost any variety of sound timber and should be straight. The bearing power of piles depends on the friction of the timber with the earth throughout its whole length and not on the bearing on the point alone as is sometimes popularly supposed. The bearing power is reliably determined by the Engineering News formula.

It must be remembered that on piers and abutments the pressure is not always uniform over the entire area. In abutments the pressure will be greater on the bridge side than on the approach side owing to the overturning effect of the earth fill; and in piers the spans may be of unequal length and thus cause more pressure on one side than on the other. Piles should therefore be spaced closer where the pressure is greatest.

Specifications and Construction

Of equal importance with the proper examination of the site and a fitting design is the further elaboration of the project by complete specifications, a careful detailed estimate and finally the faithful following of plans and specifications in the actual construction.

Specifications, without being too verbose, should cover every particular item of the work both generally and as to materials and methods.

As to the actual construction, the best method will depend on the particular work to be done and the conditions surrounding it. Attention should be paid to the qualities of the various component parts of the concrete. Except for large undertakings cement is not usually tested but is accepted as it comes from the factory. As a rule no serious results occur from this practice.

Aggregates, which constitute about 90% of the concrete, are classified as coarse aggregates and fine aggregates. Coarse aggregates are all particles of gravel, crushed stone, or other materials above $\frac{1}{4}$ in. in diameter. Fine aggregates are all particles below $\frac{1}{4}$ in. in size. As the chemical and physical proportions of the aggregates are not changed by mixing with cement and as they constitute such a large part of the concrete it follows that they should be the best to be obtained in the locality if good work is expected. This is I think if possible of more importance than the determination of the proper proportioning of the ingredients, for the reason that the proportioning has been worked out by experiment for most classes of work and the results are followed by the majority of engineers.

With proper cement and aggregates it is yet possible to get an inferior concrete by improper mixing. After all the material is in the drum of the mixer, mixing should continue for at least one minute and the revolutions of the drum should not be less than 10 nor more than 16 per minute.

Care should be taken in placing the concrete so that separation of the aggregates may not take place and the concrete should be well rammed in place to fill up all voids and pockets. Care is then needed in protecting the work from the elements for a short time.

The Ontario Legislature will place itself on record this session in support of the St. Lawrence Deep Waterways scheme. The matter was drawn to the attention of the House by P. Wellington Hay, who said that, in view of the importance of the matter, the Premier might give the members a statement of the Government's intentions in regard to the matter, if it had any. Mr. Drury spoke of the deep waterways scheme as one which was not yet in the realm of practical politics, though he hoped it soon would be. In voicing his personal opinion he said he believed thoroughly in the project.

SEWAGE DISPOSAL FOR FARMS

Reviewed by
Hector S. Phillips

Assistant City Engineer, Hamilton, Ont.

SANITATION AND SEWAGE DISPOSAL FOR FARM-STEADS AND COUNTRY ESTATES — By Dr. William P. Gerhard, Consulting Engineer, New York City. Published by the author, 17 West 42 St., New York; 12 pp., 6 by 9 in., no illustrations, no cover; price, 30 cents.

Dr. Gerhard has written a valuable and authoritative essay on rural sanitation, divided into two parts, the first containing a few statistics showing the great need of efficient health measures on farmsteads and a criticism of primitive sewage disposal devices, and the second a brief but complete discussion of "really sanitary methods of sewage disposal," namely, (1) dry disposal systems, (2) liquefying or biological systems, (3) chemical systems and (4) water-carriage system.

The author has drawn a picture of the modern and progressive farmer enjoying the benefit of good roads, daily free mail-delivery, telephones, farm tractors, and possibly a motor truck; and in the house and barns, sundry mechanical appliances, probably operated by electric current; and, most important for business progress and social betterment, the availability of running water.

He deplores, however, the fact that even on improved farms, there are few model or even tolerably safe and sanitary waste-disposal systems in spite of the amount of sound information and advice available on the subject.

Much of the matter is not new, but Dr. Gerhard points out the menace of the so-called pit privy, and condemns in very strong language the recommendation contained in some health bulletins for its use in cases where the water-carriage system of plumbing has not yet been introduced. It is described as a primitive device, embodying dangerous and unsanitary features, and representing an unsafe and undesirable accumulation of organic matter in a slow process of decomposition, with the fluid leachings possibly reaching distant wells or springs.

Full appreciation of the benefit of domestic sanitation has not yet been reached by farmers and in rural districts, owing to the difficulty of educating isolated farmer communities on these lines.

This pamphlet should be of interest to all connected with rural sanitation.

SEWAGE DISPOSAL

Reviewed by
R. O. Wynne-Roberts
Consulting Engineer, Toronto.

SEWERAGE AND SEWAGE DISPOSAL, by Leonard Metcalf and Harrison P. Eddy. First Edition, 567 p.p. 6 by 9 in. Cloth. \$5.00 net. Published by McGraw-Hill Book Co. Inc., New York.

This is text book for class use in engineering schools. The authors wrote the well-known treatises on American Sewerage Practice in 3 volumes, in 1914-15 and this text book is an abridgement with certain new matter inserted. This text book is worthy of the authors and will doubtless meet the wants of students (young and old) who have not the leisure to peruse the larger treatises. There are 21 chapters in the book, dealing with various phases of sewerage engineering. The first chapter discusses general features and gives a list of terms with interpretations. These are important because we often hear terms applied incorrectly and this leads to confusion.

The second chapter treats on the subject of quantity of sewage, estimating the growth of population, density of population, water consumption, fluctuation in flows and so

on. One criticism can be made in respect to the examples given and that is they are all based on large American cities. In as much as the text book will be used by students, it is very improbable that many of them will have the opportunity of applying the knowledge gained. Personally I believe it is desirable to impart information as it concerns the smaller towns which are very much larger in number and the difficulties are perhaps relatively more numerous and less easy to surmount.

The third chapter deals with storm water and here we must acknowledge that the lack of general investigations by engineers tends to make the solution of the problem of estimating the volume of storm water depend largely upon the judgment of the engineer. The run-off from different surfaces necessarily depends upon their characteristics, grades, seasons. Whilst 80 per cent. run-off may be anticipated under certain conditions, one eminent engineer recently cited an example where sewers designed to carry off 40 per cent. run-off under apparently similar conditions have sufficed.

The analytical method adopted by Metcalf and Eddy and sometimes called the rational method, is the one to be commended. It is interesting to note that the maximum intensity of rainfall in the eastern portion of the United States and Canada is approximately alike.

In the fourth chapter, on hydraulics of sewers, there are a number of interesting matters referred to such as minimum grades, compensation for curves, etc., which deserve close attention. The succeeding chapters, V, VI, VII and VIII deal with matters relating to construction, preliminary investigations and so on. Chapter IX discusses the chemical and biological characteristics of sewage. Chapter X deals with the sewage disposal by dilution and mentions what is necessary to provide for adequate oxidation of the organic matters and the avoidance of objectionable results.

Chapter XV deals with sludge. The principal question which concerns engineers is how to produce sludge which will de-water rapidly for quick disposal. Several methods are discussed. The Birmingham experiment in the production of gas to operate engines is an interesting development not referred to.

Chapters XI, XII and XIII describe grit chambers, screens, sedimentation and Imhoff tanks. The chapter on activated sludge process contains useful information, although no reference is made to Howarth or Bury methods of aeration.

Filters and beds are described in chapters XVI, XVII and XVIII and treatment in chapter XX. Cost estimating occupies the last seven pages. The index extends over twenty-one pages and is full. There are several examples of calculations given for the guidance of students. This text book is an excellent addition to our library and whilst it is primarily intended for students in engineering schools, it will be found useful in offices.

HOGG WAGE TABLES. Published by James O. Hogg, Jr., & Co., Box 416, Kansas City, Mo. This volume comprises a set of 59 rate tables worked out for every quarter-hour from one to sixty and three-quarter hours and at rates per hour running from thirty cents to one dollar and a half and will be found of great value to contractors. They have been compiled by a man who having served his time as a timekeeper on construction work and never having been able to find a practical set of wage tables for this class of pay rolls, and after seeing these same pay rolls come in from out of town jobs in rather confused shape, proceeded to get out this set of tables which have since been brought to a state of perfection and found to be of very great service to time-keepers in the field. The book is in convenient form, bound in leather and thus able to withstand the hard usage it is likely to receive when on the job. These tables have been checked and re-checked and then photographed from the original tracings thereby eliminating all possible errors from typesetting. The book costs five dollars and will be found a real time-saver.

Letter to the Editor

LIBRARIES FOR RESEARCH WORKERS

Sir,—Having, on several occasions, given some thought to the above subject, I believe that the following suggestions may be of use in securing results which, at least, would do for a start; it would then be much easier to approach the Government with concrete proposals, and the ability to show results already accomplished would be of great value in inducing the Government to give assistance.

There must be, in every city, a considerable number of scientific and technical books and magazines, which, if only their location were known to research workers and technical men generally, would be of great service to them.

Take, for example, the case of Toronto, the following institutions possess libraries composed largely of works of the kind referred to:—

The Engineers' Club.
The Royal Canadian Institute.
The University of Toronto.
The Works Department of the City of Toronto.
The Hydro-Electric Power Commission of Ontario.
The Toronto Hydro-Electric System.

I have no doubt others might be found which could be included in the list.

At present these libraries act together independently of each other and I have reason to believe that their systems of cataloguing are all different from each other. So far as I can see there is no reason why, with a little co-operation, all these libraries should not, practically, be one of the great advantage of all those interested in the class of books which they contain. All the books in each library, could at comparatively trifling expense, be classified and catalogued under one uniform system, using a card "title" catalogue and a card "author" catalogue.

The Dewey Decimal System, which is used in the public libraries in Toronto, and, in fact, in most of the great libraries of the world, and which was exhaustively described in the "Canadian Engineer", could be used for the classification; this would link up the small libraries referred to above with the Toronto Public Reference Library on College Street, and, if need be, with all the public libraries of the province.

If this plan were worked out properly, as I believe it easily could be, the following would be some of its advantages:—

(a) Each individual technical library could keep a card catalogue of the books etc., in all the others, so that a man consulting the list of books at any centre could ascertain whether any book he wanted were available in the city or not.

(b) A good deal of duplication in the purchase of books and periodicals, by individual libraries, might be avoided.

(c) It would frequently happen that a book desired by any one library could be consulted at another before purchasing.

(d) The owners of each library would afford facilities for any accredited technical or scientific man to consult their books, on a proper request being made. The advantage of this would oftentimes be very great.

(e) The compilation of bibliographies of certain subjects would be possible and could readily be understood.

(f) The cost of a scheme such as that proposed would be possible and could readily be undertaken.

(g) The cost of a scheme such as that proposed would be very small and could be covered by a comparatively insignificant subscription from each institution of firm participating in it; even this would be offset to some extent by certain economies which each library could probably effect by taking advantage, whenever possible, of the facilities afforded by the others.

To work the scheme properly it would be necessary to have a trained librarian with headquarters in, say, the Royal Canadian Institute or the Engineers' Club, who would advise and assist the librarians of the individual libraries in the classification of books and other literature whenever necessary, and whose duties would include the proper co-ordination of all the libraries in order to secure the best efficiency.

It is likely that quite a few private firms in Toronto possess small technical libraries of their own, and I have little doubt that, if properly approached, such firms would be very willing to co-operate in a scheme of this kind because it would be a boon to their own technical men and of much value to others.

Many scientists, engineers, chemists, etc., have certain books in their possession, which, while being of no particular value to themselves, would be very useful indeed if made available to those specially interested; no doubt the owners would, in most cases, be quite willing to donate such works to some central organization if it were felt that some advantage would thereby be gained by other men.

Having had a good deal to do with the building up of one technical library in Toronto, I feel that I can write with some knowledge of the very real advantages to be gained by the adoption of some such plan as that given above. This plan is quite feasible and, were a commencement made in Toronto, it would be practicable to extend it along similar lines to other cities in the Dominion, and this even without government assistance, although in the case of Ontario, I believe the Public Libraries Department of the Provincial Government would give any assistance in its power to a properly organized movement.

Personally, I would be very glad to see something done in this matter and am quite willing to help in any way I can to bring about the adoption of some definite scheme.

The opinions of your readers, on this subject, would be welcomed by, Yours faithfully,

A. S. L. BARNES.

Toronto, Feb. 20, 1922.

AID FOR RURAL WATER SYSTEMS IN QUEBEC

IT IS announced that J. V. A. Forget, M.L.A. for Iberville, intends to take up the question of water works systems and filters in the province of Quebec. The reason for the motion is to bring on a debate on the activities of the Superior Board of Health. Mr. Forget claims that of late years, since it got the authority, the Board of Health has been compelling municipalities to alter their water works systems and to install filters, with a view to improving the quality of the drinking water. He wants pure water, but his contention is that in many cases the municipalities against whom these orders are issued are not in a financial position to carry out these obligations. He intends to suggest that the Government give some form of aid, somewhat along the lines of the Good Roads Act, for aiding municipalities to build roads, or some other system which will lighten the burden on the municipalities.

MINING SHORT COURSE AT MANITOBA UNIVERSITY

A SHORT course in mining and geology, for prospectors and others interested in mining, has been opened at the Manitoba University, Winnipeg. The course is being conducted by the department of geology and mineralogy of the University of Manitoba, and all lectures will be delivered Monday evenings at 8:30 in the geology building. Following is a list of the lectures: Monday, Feb. 27, "The Rice Lake Field," by Prof. J. S. de Lury; March 6, "The Extension of the Rice Lake Field Eastwards," by E. M. Burwash; March 13, "The Pas Mineral Belt," by Prof. R. C. Wallace; March 20, "Mine Development," by E. M. Burwash; March 27, "Oil Geology," by Prof. J. S. de Lury; April 3, "Our Building Materials," by Prof. R. C. Wallace.

ORGANIZATION OF METROPOLITAN DISTRICTS

IN THE Report of the Sub-committee on Sewage, submitted to the American Society of Municipal Improvements, which appeared in February 14 issue of "The Canadian Engineer," some interesting information is given on the organization of metropolitan districts for the control of water and sewerage systems. While it is not a new idea, it is only within the last ten or twelve years that any definite progress has been made in this direction, on this continent. Boards or commissions have been in existence in England for some years, while the Metropolitan Sewerage Board of Massachusetts, the Metropolitan Water Board and the Sanitary District of Chicago, the last mentioned formed in 1889, are the earliest examples of metropolitan districts on this continent. In Canada we have the Greater Winnipeg Water District and the Essex Border Utilities Commission.

The increased attention that is being paid to sanitation and more particularly to the development of pure water supplies, has resulted in the formation of various commissions and sanitary districts. Although these commissions or boards have been formed for practically the same purpose, their organization varies both in regard to the powers delegated to them and also in the character of the personnel. In all cases it appears that the system tried has proved to be the one best suited to the conditions prevailing in the district. The report referred to above covered the districts formed for sewerage or drainage of metropolitan areas and not the drainage of farm areas.

The schemes tried may be classified into four groups, although one of these hardly comes within the definition of Metropolitan District. In this particular group the board or commission is practically a municipal organization, the

board being formed by the city council for the purpose of building sewers within the confines of the municipality. In a second group, may be included boards or commissions appointed by elective officers of cities, county or state, and given certain powers by the municipal or federal bodies governing municipalities composing the district. In a third group may be included the sanitary districts which are complete municipalities in themselves with powers of taxation. They can issue bonds dependent upon referendum and the commissioners are appointed by county or state officers. The fourth group comprises the sanitary districts with wider powers than above mentioned. The sanitary districts in this group are organized as municipalities with power to levy taxes and issue bonds without referendum. The commissioners are elected by direct vote of the people in the district.

Probably the best-known organization is the Sanitary District of Chicago, which comes under the last-mentioned group. The best-known of the Canadian organizations is the Essex Border Utilities Commission, which was formed in 1917 to control the metropolitan district comprising the five towns, including Windsor, Walkerville, Ford, Sandwich and Ojibway. This Commission has unusually wide powers, for it not only has under its supervision the sewerage system, but also the waterworks, board of health, hospitals, parks and town planning. Each of the five towns is represented on the Commission by its mayor and there are also 12 other commissioners, making 17 altogether. Money is provided by issuing debentures and levying special taxes, while the cost of construction and maintenance, etc., is divided in proportion to the benefit received by each town in the District. Another Canadian body is the Greater Winnipeg Water District, which was formed in 1913 for the purpose of providing the people of Winnipeg and surrounding towns and a supply of pure water. The Board consists of the Mayor and Board of Control of Winnipeg and the Mayor or Reeve of the other municipalities included in the District.

The successful operation of a metropolitan district is dependent upon the co-operation of all the municipalities concerned. There is no doubt it has many advantages. In districts where there are several towns or communities taking water from the same source and discharging sewage into the same lake or river, a comprehensive water and sewerage system would seem to be essential. It is rather surprising that more progress has not been made in Canada in this direction, particularly in the provinces of Ontario and Quebec where towns are usually closer together than in other parts of Canada and the districts more thickly populated. Conflicting interests between adjacent municipalities tend to hold up very necessary water and drainage schemes, and much trouble could be avoided in such cases by the formation of a metropolitan district.

NATIONAL RESEARCH INSTITUTE

EFFORT is being put forth again this year by the Honorary Advisory Council for Scientific and Industrial Research to obtain a grant from the Dominion government of \$500,000 for the establishment at Ottawa of a National Research Institute. Last session such a grant was approved by the House of Commons but was defeated in the Senate. It is to be hoped that the added publicity to the work of the Council which has arisen during the past year and the increasing appreciation of its services may result in the money being set aside for this commendable object.

In a recent brochure issued by the Council it is pointed out that a lamentable loss in our national assets will be incurred if the variety of occupation which is necessary to retain the most ambitious scientific workers in this country is not provided. If the specialized scientific investigation that must be conducted to back up our industries has to be carried out in a foreign country, it follows that our investigators must either expatriate themselves to have any share in the scientific up-building of our industries or relinquish altogether any claim to shape them towards the ends desired.

That there are many scientific investigations that can only be undertaken by a central independent body supported by government funds is readily evident when one considers the great variety of researches that are under way or are contemplated in this country. The universities and the government departments are of necessity charged with certain routine work of an instructional or administrative character. To mix up research with such activities would be good for neither and the only satisfactory solution of the problem is the establishment of some such institution as that which has been proposed by the Research Council, viz., a national research institute. The undoubted possibilities of such an institute on the side concerning which much is already known, that is work comparable to that undertaken by the U. S. Bureau of Standards, are very great. It is believed that the returns to industry and to the country at large from the explorative activities in little known fields would many times repay the amount of money now being asked of the government.

IMPORTANCE OF KNOWING COSTS

SOME one has said that the most apt definition of engineering is the "art of doing well with one dollar what any person can do with two." It is almost impossible for an engineer to do this without an intimate knowledge of cost and cost analysis.

The engineer of the present day in order to give the maximum service to his client for expenditure on new work must have a thorough knowledge not only of the theoretical part of the design but also of the methods of construction necessary to give the minimum of cost. There is no question but that this branch of the work of the engineer is exceedingly important. In fact much more important than appears to be realized by many of the profession. Too often the question of cost is left entirely to the contractor who has in hand the construction work. But the engineer who supervises and lays out the work is negligent in his duty to his employer as well as in his own best interests if he does not keep in close touch with the costs of the different elements of the work in hand. Much more necessary it is for him to have such knowledge if the construction is being done by himself for his employer. It is only by obtaining full knowledge regarding costs that he can supervise intelligently. By a slight change in the method of arranging forms for concrete, by a different position for the concrete mixer, or in a hundred and one different ways he will find that he can save money and reduce the cost. There is another indirect effect which this study of costs has. The engineer who frequently has before him the aim of obtaining most efficient results will not be led to needless outlay in the matter of design. He will study each element of the design in its relation to the purpose it must serve and will then choose the material which will do the work as cheaply as possible.

The foregoing statements are not intended as a plea for engineers at the expense of efficiency or durability but rather as a warning against the use of expensive and unnecessary details.

PERSONALS

HAROLD B. FISK, manager of the Walsh Plate & Structural Works, Ltd., Drummondville, Que., was elected as secretary of that company at its recent annual meeting.

GEORGE HOGARTH, M.E.I.C., chief engineer of the Department of Public Highways, for Ontario, has been elected president of the Association of Ontario Land Surveyors.

JOHN WILSON, JR., who for the past fifteen years has been a member of the sales organization of the Dominion Bridge Co., Montreal, or associated companies, has resigned in order to accept appointment as sales manager of the Walsh Plate & Structural Works, Ltd., Drummondville, Que.

H. A. TERREAULT, superintendent engineer of the Montreal Waterworks, has been placed in charge of the

various workshops and yards in the city. He will also supervise the administration of the sewer pumping system.

S. FORTIN, assistant director of public works, has been appointed city surveyor of Montreal, which has the title of the head of that branch of the civic service before the organization of the public works department. By his appointment as city surveyor, Mr. Fortin is duly authorized to sign the official plans of the department, as required by law.

GEO. W. OTTERSON who is now residing in Toronto, having accepted a position as consulting engineer to the Canadian Municipal Equipment Corporation, Ltd., was born February 22, 1864, in Atlanta, Ga. After a long practical experience in mining and dredging, and in the construction of municipal water works, sewage and sewage-treatment plants throughout the United States and also in Hawaii and other United States possessions, Mr. Ottersson went to Alaska in 1897, and spent the following fifteen years in dredging, hydraulic work and mining engineering in that territory.

He returned to the United States in 1912 in order to form a company for the manufacture of improved municipal equipment which he had designed and upon which he had obtained patents, and he formed the Ottersson Auto-Eductor Co. in the State of Washington. Mr. Ottersson recently disposed of his interests in that company, of which he was president, upon a royalty basis. While he will devote the greater portion of his time to the new Canadian company which will manufacture his machines, he also intends to establish a private practice in hydraulic and sanitary engineering in Toronto, making a specialty of the design of grit chambers, and of hydraulic dredging and sluicing and sewage problems.

OBITUARY

HON. GEORGE ROBERT SMITH, M.L.A., died in Thetford Mines, P.Q., on Feb. 20. Mr. Smith was born at Newark, N.J., February 17, 1860, and came to Canada in connection with the mining industry. He was vice-president and general manager of Bell Asbestos Co. at Thetford Mines and vice-president and general manager of the Asbestos Manufacturing Co. of Montreal. He was one of the founders of the Canadian Mining Institute, and at one time its president.

Alberta's coal production fell off nearly a million tons in 1921 while Canada was importing 18,102,610 tons of American coal, according to the report of the Alberta provincial mines branch. Alberta produced 5,927,170 tons last year against 6,908,923 tons the previous year. Production last year was the third largest in the history of the province. Need of regulations standardizing Alberta coal to make it more saleable in Saskatchewan and Manitoba are urged in the report, which also points out that there should be a greater market for Alberta coal on the Pacific slope. Some Alberta coal is now being used for bunkering in B. C. ports, and this business is growing, but Seattle and other ports on the Pacific American slope are using much Australian coal which the Alberta product might displace. Alberta has 331 coal mines, and 90 were abandoned last year.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Copper Cliff, Ont., erection of a school	Mar. 9	Feb. 28
Essondale, B.C., erection of addition to hospital	Mar. 24	Feb. 28
Kitchener, Ont., construction of a pump house and a reinforced concrete pump well	Mar. 13	Feb. 28
Raleigh Tp., Ont., erection of a school....	Mar. 18	Feb. 28

BRIDGES, ROADS AND STREETS

Bridgeburg, Ont.—William M. German, of the firm of German & Brooks, has given official notice of intention to apply for a charter for the Niagara Bridge Co. to construct a bridge over the Niagara River between Port Erie and Buffalo.

Cobourg, Ont.—The Town Council is considering the paving of King St., from William St. to the Eastern end of the town, a distance of 1 1/3 miles.

East Angus, Que.—The Town Council passed a by-law authorizing a loan of \$110,000 towards the new bridge.

Hamilton, Ont.—A highway from the western limits of James Street to the Mountain Boulevard will be constructed at a cost of \$137,000.

Hamilton, Ont.—The question of street widening was dealt with on March 3, at a meeting held by the Town Planning Board at the City Hall by James O'Brien, of Toronto, who is deeply interested in the subject and who recently drafted a bill for deferred street widening for the Toronto Civic Guild, which will be introduced at the present sitting of the Ontario Legislature. The speaker explained that thirteen clauses in the draft bill, pointing out that in the event of this bill becoming law, City Councils will have the authority to fix up street lines, which will become effective at a fixed time between three years from the passing of the by-law, and fifteen years.

Kingston, Ont.—The Board of Works decided to purchase the 1922 supply of cement in the open market.

Kingston, Ont.—A concrete walk will be laid on Dursion St. north of Russell St. Cowdy St. to Stephen St. will be opened up.

Montreal, Que.—In all probability the proposed 3,000,000 highway through the Island of Montreal, to extend from the bridge terminal at Bout de l'Île to St. Anne de Bellevue, will soon materialize and work on this thoroughfare is expected to begin early this year. It is to be built in sections and will be 150 ft. wide.

North Vancouver, B.C.—In an endeavor to bring about the adoption of some definite form of connection between the north and south shores of Burrard Inlet at the Second Narrows, a committee consisting of Ald. F. E. Woodside, Mayor G. H. Morden and Reeve J. Y. McNaught will shortly wait upon the Vancouver Board of Trade Commissioners. This decision was reached at a recent meeting of the Burrard Inlet Tunnel & Bridge Co. A communication to the company from the Strauss Bascule Bridge Co., of Chicago, revealed that a double track bridge could be constructed for

\$1,016,500, while a single-track bridge could be built for \$880,000.

Ottawa, Ont.—Carleton County Council authorized County Engineer T. H. Byrne to make a survey of the road from Hawthorne to the boundary of Russell County, which is to be widened in the near future.

Quebec, Que.—Ivan Valee, chief engineer of the Provincial Department of Public Works, announced that the department is preparing plans for several new bridges.

Quebec, Que.—Orders have been issued by the Provincial Government to continue work on the Drummondville, East Angus St. Alexis and St. Thomas bridges.

Ste. Anne de Beaupre, Que.—It is reported that the municipalities along the highway between Quebec and Ste. Anne de Beaupre have come to a final arrangement with the Provincial Government to raise sufficient money to build a hard surfaced roadway between Beaupre asylum to St. Anne will probably start early in the spring.

St. Catharines, Ont.—Lincoln county spent \$328,863 on county roads and \$109,961 on suburban roads during 1921.

St. Catharines, Ont.—Lincoln County Council passed a by-law providing for the raising of \$240,000 for county road construction, and the raising of \$36,000 for maintenance.

St. John, N.B.—The Railway Commission has ordered the construction of an overhead bridge at the C.P.R. crossing, Douglass Ave.

St. John, N.B.—The Common Council is considering the purchase of a motor flusher, a mechanical ejector for cleaning catch basins, several pieces of apparatus for laying pavements, motor truck and a larger asphalt plant.

Stamford Tp., Ont.—The Township Council will urge the Hydro-Electric Power Commission of Ontario to build certain bridges in the township.

Toronto, Ont.—Specifications will be completed and tenders called at once for the construction of the new Gerard St. bridge.

Toronto, Ont.—The Works Committee passed the project for widening Bloor St., from Sherbourne St. to Spadina Ave. Estimated cost, \$1,500,000.

Toronto, Ont.—The City Council plans the construction of a concrete sidewalk on Marlborough Place, at an estimated cost of \$1,224. Work to commence in the spring.

Toronto, Ont.—The City and Harbor Board will urge the Dominion Government to include an appropriation in next year's estimates for the construction of a bridge to the Island.

Toronto, Ont.—The Board of Control recommended to the City Council that tenders be called for the construction of a bitulithic pavement on Coleman Ave., from Barrington Ave., eastward.

Toronto, Ont.—The Board of Control endorsed and forwarded to the City Council for adoption the recommendation of the Works Committee that Bloor St., between Sherbourne St. and Spadina Ave., be widened to 86 ft., at an estimated cost of \$1,500,000.

Toronto, Ont.—Works Commissioner R. C. Harris recommended the construction of the following pavements: Fairford Ave., from Moxley Ave. to Coxwell, \$24,316; Maughan Crescent, Edgewood Ave. to Robbins Ave., \$16,589; Wabash Ave. from Sorauren Ave. to the east end, \$36,348; and St. Clair Ave., from Cobalt Ave. to Runnymede Road, \$35,348.

Toronto, Ont.—The Board of Control has endorsed and forwarded to Council for adoption, the recommendation of the Works Committee that Bloor Street, between

Sherbourne Street and Spadina Avenue, be widened to 36 ft., at an estimated cost of \$1,500,000, of which the taxpayers in general will contribute \$900,000 and the property owners benefited \$600,000.

Windsor, Ont.—A deputation will be sent to Toronto to interview Hon. F. C. Biggs, Minister of Public Works and Highways, in regard to the possibility of launching the promised government road building program in Essex County with as little delay as possible.

Windsor, Ont.—This city's share of the cost of paying 14 miles of county and Provincial highways in the Windsor suburban area, which extends to Essex, is approximately \$150,000. It is proposed to ask the Provincial Government to complete this work in two years. The city is willing to issue debentures covering its share of the cost.

WATER, SEWAGE AND REFUSE

Chatham, Ont.—The possible reclamation of 1,800 acres of marsh land in the vicinity of Rondeau is being considered. One of the farmers interested in the scheme is said to have purchased 100,000 tile, which he will put in as soon as weather permits.

Chatham, Ont.—The Provincial Board of Health has been called in by the Chatham Water Commission, to investigate the water problem, and to give a statement, regarding the relative merit of Lake Erie and the River Thames, as a permanent source of supply of water for Chatham. It is proposed to spend \$5,000 in alterations to the plant and in experimenting on various processes of filtration. Engineer Dallyn states that after this is done the present filtration plant on the river will be able to produce an absolutely pure and wholesome water at all seasons of the year.

Kingston, Ont.—The Board of Works awarded contract for the supply of castings to T. G. Bishop.

Kirkland Lake, Ont.—By order of the Township Council of Teck, several of the wells which supply the townsite with water are being widened and deepened. The installation of a water system is being considered.

Oakville, Ont.—The Town Council decided to proceed with the installation of an auxiliary pump in connection with the water works system.

Ontario, Province of.—Tenders will be received by the Hydro-Electric Power Commission of Ontario till 1 p.m., April 10, 1922, for widening and deepening the channel of the Welland River and a portion of Queenston-Chippawa power canal. Plans and specifications may be obtained at the offices of the Commission, Toronto or Niagara Falls, Ont. (See official adv.).

Ontario, Province of.—Tenders will be received by the Hydro-Electric Power Commission of Ontario until 1 p.m., April 10, 1922, for construction of concrete intake structure and ship channel in the Niagara River. Plans and specifications may be obtained at the offices of the Commission, Toronto or Niagara Falls, Ont. (See official adv.).

Ottawa, Ont.—Tenders will be called in the near future for the construction of the Emmett street sewer.

Ottawa, Ont.—The Canadian Des Moines Steel Co., Chatham, Ont., has received an order from the city for the building of 2,100 ft. of 51-in. pipe, and 150 ft. of 42-in. pipe, together with special fittings.

Peterborough, Ont.—The new \$300,000 filtration plant is now in partial operation, and the improvement in the quality of water is distinctly noticeable. The plant is being tested out each night, and the day requirements are taken from the two-million-gallon reservoir. This plan will continue until the tuning-up process has been completed to the satisfaction of the contractors and engineers.

Riverside, Ont.—Contract let to Collatti Brothers for the construction of a storm sewer on St. Louis Ave., at an estimated cost of \$2,800.

St. John, N.B.—Plans are being prepared by the City Engineer for the construction of a trunk sewer on Lansdowne and Dufferin Avenues.

Saanich, B. C.—The first of the work on the Gordon Head water extension was authorized recently by the Saanich Council, when instructions were given to at once proceed with the laying of water mains from Telegraph Bay along Windsor Place to Douglas Ave., and thence along to Charles St., and also from the present main end on Ruby Road to Cedar Hill Road, thence to Fulton Road and down Shelbourne St. Reeve Watson, Councillor McWilliam and Clerk Cowper were appointed a committee to secure 12-inch pipe.

Toronto, Ont.—The City Council plans the construction of a sewer on McCaul St., at an estimated cost of \$3,810, and another on Walpole Ave., at an estimated cost of \$2,670.

Toronto, Ont.—The City Council plans the construction of a 6-inch water main, for Ingram Ave., a length of 214 feet, at an estimated cost of \$723.08, and a length of 321 feet, at an estimated cost of \$1,077.03, for Lightbourne Ave.

Vancouver, B. C.—City Council let a contract to the Vancouver Engineering Works for the supply of 18-in. riveted pipe for making the connection on Bodwell Road, between Laurel St. and the reservoir. Their tender was \$3.20 per lineal foot, or a total of \$7,251.20.

LIGHT, HEAT AND POWER

Brandon, Man.—Representatives of Brandon City Council and Brandon Board of Trade have requested the Manitoba Legislature to make an appropriation at the present session for the extension of the hydro-electric lines to Brandon.

Bridgeburg, Ont.—A motion will be introduced in Council that steps be taken to bring Hydro power here while its line to Stevesville is being constructed.

Cobalt, Ont.—Work on the new power development for Porcupine is being rushed. The present plans are to complete the 28-mile transmission line within three months, and to turn back the current from the present power houses to assist in the construction of the new power house at Sturgeon Falls.

Fort William, Ont.—The Hydro-Electric Power Commission has signed a contract to supply Nipigon power to the Consolidated Elevator here. The contract calls for the delivery of between 500 and 600 h.p. The construction of a line to the Consolidated plant means that several other elevator plants in the vicinity will be able to secure power.

Winnipeg, Man.—The following prices were received by the local Hydro-Electric System for 100,000 ft., more or less, of 3 1/2-in. fibre conduit: Filer Smith Machinery Co., 9.28c per ft. for Orangeburg Fibre Co. product; Northern Electric Co., 11.07c per ft. for American Fibre Co. product; Canadian Johns-Manville Co., 9.5c per ft.

RAILWAYS

St. Thomas, Ont.—It is reported that the Wabash Railway Co. is planning the erection of locomotive repair shops in this city in the near future, at a cost of approximately \$500,000.

Toronto, Ont.—Following a conference of representatives of York Township Council, the Toronto Transportation Commission and the Ontario Railway and Municipal Board, it was decided that York Township Solicitor Spence should meet the solicitor for the T.T.C. to draft legislation covering the extension of street car lines into York Township.

Windsor, Ont.—According to a statement made recently by Hon. W. C. Kennedy, Minister of Railways and Canals, there is no possibility of the Grand Trunk yards here being electrified, owing to the expense of such work.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Extension to Shawinigan Hydro - Electric Plant

New 41,000-H.P. Unit Has World's Largest Steel Casing and Biggest Valve Ever Built — Foundation Slab is 12-Ft. Thick, 52-Ft. Space — Paper Read at Last Annual Meeting of Engineering Institute of Canada

BY JULIAN C. SMITH

Vice-President and Chief Engineer, Shawinigan Water & Power Co., Montreal

IN PRESENTING a description of the latest hydro-electric development at Shawinigan Falls, it is the writer's intention merely to describe briefly those features of design and construction which, because of their departure from more usual practice, are worthy of attention.

The rated capacity of the waterwheel of the new unit is 41,000 h.p., and the wheel will operate at 138.5 r.p.m. under a head of 145 ft. The art of manufacturing wheels has advanced rapidly during the last twenty years. The first wheels installed at Shawinigan in 1903 were rated at 6,000 h.p. at 180 r.p.m., and were the largest wheels that could be built at that time. By the time of the second

ranted. The total flow for the full capacity of 220,000 h.p. at existing load factor for the two power houses at Shawinigan Falls will be about 12,000 cu. ft. per second.

Forebay Extension

The forebay extension begins on the downstream side of the bridge and is carried in a straight line to the end of the bulkhead extension. Excavation in this part of the work has been begun and will be carried in the dry as closely as possible to the existing crib. After the bulkhead and the new crib are completed and as much of the rock taken out as possible, the extension will be flooded

POWER HOUSES NOS. 1 AND 2, SHAWINIGAN FALLS — EXTENSION TO NO. 2 IS BEING CONSTRUCTED AT EXTREME RIGHT OF PHOTO

development at Shawinigan, in 1910, it was possible to install horizontal double-runner turbines with a rating of 18,500 h.p. In 1922 there are wheels of 52,000 h.p., and the Hydro-Electric Commission of Ontario are considering for their Queenston installation waterwheels having an even greater capacity.

In order to provide the water for the unit at Shawinigan, about 3,000 cu. ft. per second additional flow is required. The existing canal through which the water flows to the head-gates is 160 ft. wide by 35 ft. deep. It is restricted to this width at the upper end by the bridge which carries the railroad spur and roadway giving access to the power house. Owing to the fact that the velocity of the water in the canal will be increased only about 25%, or to $3\frac{1}{4}$ ft. per second, which is not excessive, it was decided that the expense of widening the canal, which would necessitate an additional bridge span, was not war-

and the old crib and remaining rock will be removed by dredging.

Gatehouse

The extension to the gatehouse is very similar in detail to the existing building. It is 80 ft. long and contains five sluiceways, each 12 ft. wide, the same width as the sluiceways in the existing building, thus enabling the same stop-logs and similar gates and racks to be used. It is not intended to instal gates at present, as it is hoped to regulate the flow by the Larner-Johnson valve. However, grooves will be left in the concrete so that gates can be installed later if necessary.

Prevention of Ice

One of the features of the 1910 development at Shawinigan Falls was the provision for prevention of the forming of ice on the racks. In the early days of the power

development at Shawinigan the operation of the gates and the clearing of the racks were made very difficult in winter owing to the formation of ice on all iron parts in contact with the water. It was believed that the formation of this ice was due to the fact that the iron, being slightly

the building. The air is drawn into the fan through electric heaters and discharged

GENERAL PLAN SHOWING TUNNEL AND EXTENSION TO BULKHEAD AND POWER HOUSE.

colder than the water, conducted heat away from the water thus causing the formation of ice on the iron. In order to raise the temperature of the iron slightly, large air ducts are provided in the gatehouse floor, extending the entire length, with laterals across the building into the chambers leading to the penstocks, so that air can be discharged into these chambers and blown down against the racks.

at a temperature of 150 deg. F. into the main duct. Since the installation of this system there has been no ice formation inside the building and no tendency of the ice in the water to stick to the rack bars. Further, the ice has not formed around the gates and consequently no difficulty has been experienced in operating the head-gates in the most severe weather.

Gathering Tube

A very interesting feature of the development is the tunnel intake, designed by R. D. Johnson and P. Wahlman of New York. It consists of five parallel water passages, one for each of the sluiceways in the bulkhead, which empty into a manifold, or gathering tube. The water passages are nearly rectangular in section and meet the gathering tube at an angle of about 35 deg. The upstream water passage is joined to the gathering tube at the control section by means

CROSS SECTION THROUGH CENTER LINE OF NEW UNIT

This heating system is being extended to serve the addition to the gatehouse, as it has been found that the system is very efficient. A fan with a capacity of 60,000 cu. ft. of free air per minute is located at the far end of

of an elbow, the other passages join the gathering tube in long narrow slots. The gathering tube itself is circular in section, 20 ft in diameter, at the downstream end where it meets the tunnel, and tapering to 13 ft. 4 in. in diameter at the upstream end or control section.

The function of the intake is to cause a uniform flow

of water in each of the five sluiceways and to discharge the water into the tunnel with a minimum of disturbance. The hydraulic theory of its operation is roughly as follows:

In order to fulfill the hypothesis on which the design is based, the flow from the water passages into the gathering tube must be uniform per unit of length.

The diameter of the gathering tube at any section was fixed by making the quantity of water flowing at that section proportional to the square of the velocity; that is, at any point in the gathering tube Q/V^2 is a constant. This relationship was decided on after some study, as giving the most economical dimensions for the gathering tube.

At any point beyond the control section in the gathering tube, the water arrives from two sources, a small part of it from a section of the slot adjacent to the point considered, and a large part from the gathering tube itself. The difference between the loss of head which has accumulated in the gathering tube up to this point and the loss which has accumulated in the water passage must be just large enough to cause the required quantity of water to flow through the slot.

When losses up to the point under consideration have been determined, the depth of slot at that point can be calculated.

The friction loss was based on a coefficient of 130 in the Hazen and Williams' formula, which is equivalent to about $N = 0.12$ in Kutter's formula, and the coefficient of discharge for the slots was taken as 0.98.

The total loss of head in the intake has been estimated to be 4½ in. for a distance of 2,940 sec. ft. This loss may seem rather large at first sight, but the complication

GENERAL LONGITUDINAL SECTION, EXTENSION TO NO. 2 POWER HOUSE, SHAWINIGAN FALLS

a little head to insure nearly uniform distribution of flow through the racks, in the belief that the total loss will be less than would ordinarily be the case with high local velocities through them.

It is interesting to note that the uniformity of distribution is not to any material extent, within reasonable limits, a function of the quantity of water drawn through the intake, so, with the dimensions determined for the maximum draft, the distribution will remain practically uniform for other quantities drawn.

A little study of the problems involved in the design will indicate that the forces dealt with are very small, yet their relation to each other is the only consideration upon which reliance can be placed to secure the desired distribution of flow. A slight variation of the dimensions determined may cause a noticeable unbalance of distribution. This was well shown in a model which was constructed for us by the I. P. Morris Co., and tested in their laboratory. At the first run it was found that the flow was unbalanced, especially between the first, or upstream, and second sluiceways. The model was emptied and the dimensions checked up and it was discovered that the throat of the control section was a little too large. This was corrected by placing fillets ¼ in. thick, top and bottom, in the throat, and the model was again tested, with the result that a uniform flow was obtained in all five sluiceways. The scale of the model was 1/15 full size, so these ¼-in. fillets would correspond to a little less than 2 in. in the full-sized tube.

The water passes from the gathering tube into a tunnel, 20 ft. in diameter, which delivers it to the steel penstock at the bottom. The tunnel was chosen in preference to a steel penstock for economy both in construction and upkeep. The completed portion of the tunnel has cost less than \$370 per foot, whereas the steel pen-

REINFORCING IN PLACE FOR FOUNDATION SLAB, 12 FT. THICK, 52-FT. SPACE

of the design necessary to effect a material reduction did not appear to be warranted by the gain in energy, and the assurance of getting even distribution of flow would be reduced. It was thought proper, therefore, to sacrifice

designed to take care of the static head plus the surge. The allowance for surge at the lower end amounts to a little more than the static head, the combined pressure being 126 lbs. per square inch. In other words, the tunnel at the bottom is reinforced to take care of a bursting stock, which connects the tunnel to the Larner-Johnson valve, will cost erected about \$450 per foot.

CONCRETE POURED TO ELEVATION OF TUNNEL—PORTAL AT SOUTHEAST CORNER OF POWER HOUSE

The tunnel is lined with concrete averaging about 2 ft. in thickness, which is reinforced throughout its length. The reinforcement for some distance from each end was pressure of 3,600,000 lb. per foot. This reinforcement consists of hoops of 1 1/4-in. diameter bars, spaced 3 in. on centres at the lower end of the tunnel, 12 in. on centres in the central part, and 6 in. on centres at the upper end. The hoops are tied together longitudinally by 3/4-in. diameter bars about 2 ft. on centres, which act as spacers and as temperature reinforcement.

TUNNEL, LOOKING TOWARD POWER HOUSE—POURING CONCRETE IN FIRST 100-FT. SECTION

A section of steel penstock, 77 ft. long and 20 ft. in diameter, connects the tunnel with the Larner-Johnson valve. This penstock is built of 1 1/4-in. plates and is anchored into the tunnel by means of seven rings of 4 by 4

by 3/4-in. angle, which are rivetted to the plates. These rings will also serve as seals to prevent leakage along the penstock.

The loss of head in the tunnel and penstock, using a coefficient of .012 in Kutter's formula, will be about 0.7 ft., so that the total loss of head up to the turbine will be about 1.1 ft.

The rock through which the tunnel was driven is a very hard granite, compact throughout the length of the tunnel except at the upper end near the surface, where faults were encountered.

The tunnel was driven from the lower end in the

usual manner, by first driving a heading 10 to 15 ft. ahead of the face and then shooting down the roof. Most of the mucking was done by a one-yard, motor-driven. Thew shovel of a type especially designed for this kind of work. The muck was loaded by the shovel into skips, hauled to the portal and hoisted by derricks either to the crusher platform or to dump cars which carried it to the spoil bank.

Owing to the hardness of the rock, the cost of tunnel excavation was high, averaging \$7.22 per cubic yard. The

cost of drilling and blasting alone was half of this amount, the balance being made up of handling, loading, hauling to dump and pumping.

After the excavation was completed, the invert for the lining was placed, beginning at the upper end and working towards the portal, the bottom being cleaned out and the tracks removed just ahead of this work.

The forms were then erected on the invert and the upper part of the lining concreted, beginning about 30 ft. from the portal and working towards the upper end.

The forms for the straight portions of the tunnel were made of 2-in. B.C. fir lagging supported on structural steel ribs spaced 2 ft. 6 in. on centres. The lagging was delivered to the job in 10-ft. lengths and dressed to a 10-ft. radius like the staves of a tank. The steel ribs were composed of two 6 by 3½-in. angles back to back, and were anchored to the rock by means of 1-in. bolts so that no internal bracing was required, and the whole interior of the tunnel was left clear for the dismantling and carrying ahead of the forms as the work progressed.

The concrete was mixed at the upper end of the tunnel and delivered by means of a chute to a hopper part way down the slope. From the hopper it was fed into a pneumatic mixer which forced it under 200 lb. pressure through an 8-in. pipe into the forms. This meth-

INTERNAL C. I. CYLINDER FOR 20-FT. JOHNSON VALVE BEING FACED ON 18-FT. VERTICAL BORING MILL

od of placing the concrete gave us a very dense lining, with a remarkably smooth surface.

The forms for the tunnel elbows were built outside on a platform near the carpenter shop and there lowered into the tunnel in sections about 5 ft. long.

In designing the power house superstructure the details of the existing building were followed as closely as possible and the only marked differences are in the elevation of the operating floor and in the height of the new generator room.

The extension is 80 ft. long and the same width and height as the old building, that is, 115 ft. wide by 75 ft. high.

The new unit occupies the upstream part of the extension, the generator room being 50 ft. wide by 80 ft. long and the full height of the building. It is served by a crane, the trolley of which is designed to lift 200 tons and the bridge for a load of 150 tons at either end or 200 tons at the centre.

The operating floor of the new units is 16 ft. above the operating floor in the old part of the building.

The downstream part of the extension will be served

by the 100-ton crane that serves the old generator room.

The Moody draft tube in the substructure of the extension presented a number of difficulties both in design and in construction. The principal difficulty in design was in connection with its reinforcement.

The draft tube block can be described as a flat plate with a circular hole in the middle, the bell of the draft

WORLD'S LARGEST STEEL CASING FOR HYDRAULIC TURBINE — PARTIALLY ASSEMBLED AT DOMINION ENGINEERING WORKS

tube being suspended from the bottom of the plate. The walls supporting the plate are roughly in the shape of a horseshoe, 52 ft. in diameter and 48 ft. between the points. The plate is 12 ft. thick. The total load, including the weight of the block, is something over 12,000,000 lb. The problem was to reinforce this block in such a way that it could be poured in sections not exceeding 250 cu. yd., which was about a day's run for the mixer.

The most obvious method of reinforcing it was to run bars in two directions at right angles to each other, as in an ordinary flat plate. This method, however, was found to be impracticable on account of the fact that there would have been required four layers of 1½-in. bars on 6-in. centres each way, which would have meant a total of eight layers where the bars crossed, or a network of bars 4 ft. deep like a stack of 6-in. mesh sieves. It does not require a very vivid imagination to picture the kind of

C. I. PLUNGER FOR 20-FT. JOHNSON VALVE—WEIGHT, 46,000 LB.

concrete that would have been obtained at the bottom of that mass of steel.

The method used was, therefore, decided upon as most nearly complying with all of the requirements. It

consists of hoops and vertical bars placed near the outside of the bell, horizontal bars placed radially at the bottom of the plate and diagonal bars to take care of the shear or web stresses. The part of the block between the points of the horseshoe was reinforced as a beam in order to provide support for the plate on that side.

In this system the bars are in comparatively short

RUNNER FOR 41,000-H.P. TURBINE—BEING MACHINED ON BORING MILL

lengths and easy to handle. There are at most two layers of bars vertically and they do not cross to form a grid and construction joints can be formed on practically any radial line, as there is no shear on the radial planes.

The stresses were limited to 12,000 lb. per square inch tension in the steel, 500 lb. per square inch compression in the concrete, and 50 lb. per square inch bond stress.

In designing and constructing the formwork a great deal of care was taken to prevent deflection of the forms and to ensure smooth surfaces for the water passages. The construction of the draft-tube bell particularly was a very intricate piece of work and required the services of several pattern makers. The ribs for the bell were all cut and shaped in the shop and the whole assembled before being set in place. We have been amply repaid for the care taken in this regard by the smoothness of the finished surfaces and the resulting accuracy of line and grade, which will make the assembling of the machinery merely a matter of setting in place.

Larner-Johnson Valve

The Larner-Johnson valve which is being manufactured for this development at the Dominion Engineering Works is the largest valve that has ever been built. It is about 23 ft. in diameter and 27 ft. long, and weighs approximately 150 tons. The moving part of the valve alone weighs 25 tons.

The valve will be located in a chamber outside of the power house, between the 20-ft. diameter penstock and the turbine casing. It can be operated either in the valve chamber or by means of a three-way valve at the generator control board.

The valve consists of a bell-shaped, cast-steel shell, 22½ ft. inside diameter, tapering to 13 ft. diameter at the outlet, a cylinder inside the shell, 16 ft. in diameter, which is rigidly attached to the shell and has a conical head pointing up-stream, and a plunger which slides in the cylinder. The plunger terminates in a conical nose.

Between the cylinder and the plunger there is an annular chamber, sealed at one end by a ring attached to the plunger and at the other end by a ring attached to

the cylinder. These rings are lined with brass and serve as guide bearings for the plunger.

The valve is hydraulically operated by a differential pressure on the two sides of the plunger. When the valve is open and balanced, the cylinder and the annular space between cylinder and plunger are under the full penstock pressure and of course the penstock pressure is exerted on the nose of the plunger. To close the valve the penstock pressure is maintained in the cylinder and the pressure in the annular chamber is released. This causes the plunger to move forward and closes the valve in a manner similar to the action of a needle valve. An automatic damping device slows down the motion of the plunger as it nears the valve seat.

To open the valve the operation is reversed. Water is admitted to the annular chamber under penstock pressure and the pressure in the cylinder is released.

The pressure in the cylinder and in the annular chamber is controlled by means of three 12-in. Larner-Johnson valves so arranged and connected that the large valve can be balanced in any position from closed to full open.

Selection of Type

When the second hydro-electric development was made in Shawinigan, in 1910, the horizontal type of unit was adopted, and the 18,500-h.p. double-runner turbines then installed were among the largest machines to be built at that time. It was then assumed that the ultimate development at this plant would be carried out with this type of machine. When, however, the demands for additional power necessitated an extension of the plant in 1920 and a careful study was made of the more recent development of turbine manufacture, it was decided to adopt the vertical type of unit as being the most economical machine to produce the required power.

It is not necessary here to compare at length the relative merits of vertical and horizontal units. In adopting the vertical type of machine for this installation, consideration was given to economy of space and material. The centre-to-centre spacing of the three 41,000-h.p. machines which will be the ultimate development at Shawinigan, is 60 ft. The centre-to-centre spacing of the present 18,500-h.p. units is 40 ft., so that there is a decided saving of space with the new vertical units. The dimen-

CAST-STEEL CASING PARTIALLY ASSEMBLED — ENTRANCE SECTION REMOVED TO SHOW GUIDE VANES

sions of the vertical machines are such that an extension of the present power house on the same dimensions affords ample room. In fact, were it not for the necessity of extending the present crane runway, the downstream side of the power house could be narrowed considerably in the extension.

The problem of bearings for vertical units has been successfully solved by more than one manufacturer, and this objection to the vertical type of construction no longer exists. The advantages of weight and low mechanical stresses are on the side of vertical machines, so the change from horizontal to vertical units in this power house was amply justified.

Rating and Characteristics

The rating of the generator is 30,000 k.w. at 75% power factor, which is equivalent to 40,000 k.v.a. The power will be generated at 11,000 volts, 3 phase, 60 cycles and the machine will operate at 138.5 r.p.m., being designed with 52 poles.

The short-circuit characteristics of the machine are such that the instantaneous short-circuit current will be 3.3 times full load current, and the sustained short-circuit current at normal excitation will be equal to twice full load current. It is interesting to note that with the high internal reactance necessary to give these results the short-circuit current on light load and correspondingly light excitation will not exceed one-half full-load current.

The stator coils are form wound and the mica insulation is put on in the form of tape. The coils under test have withstood a break-down voltage up to 59,000 volts on the average. The full-load regulation of the machine at 100% power factor will be 15%; and at 90% power factor, 28%.

Mechanical Features

The rotor is of cast steel and is built to withstand the stresses which would be developed at double normal speed; that is, at a peripheral velocity of 21,800 ft. per minute.

To facilitate handling, the rotor is constructed in six parts; that is, there are three horizontal sections which are split vertically along the axis of the shaft. When the rotor is erected the two halves will be assembled on the shaft and then drawn together with 36 bolts, which will be shrunk in place. Each pole piece weighs about one ton and is dovetailed into the rotor and secured by wedges and a retaining ring at top and bottom, as is usual in this type of construction. In order to reduce windage, the spokes of the rotor are encased with steel plates. The generator rotor and turbine runner are mounted on separ-

able disc. This construction of the lower disc insures a practically uniform distribution of the weight over the surface of the bearing. The oil flows from an elevated tank up along the shaft and is drawn through the bearing by the centrifugal action of the rotating disc. The lubricating oil is cooled by a water coil which keeps the temperature of the oil below 55 deg. C. and enables

ASSEMBLY OF GUIDE VANES ON POWER DISTRIBUTOR RING

the bearing to operate with the exceedingly small oil circulation of about 4 gal. per minute. The bearing is required to carry the weight of the rotor, the turbine runner and the hydraulic thrust, which in this unit amount to about 723,000 lb.

Brakes

In order to bring the machine to rest in a short time when desired, a combination of air and oil actuated brakes is provided, which operate on the underside of the rotor. The air pressure required for these brakes is 100 lb. per sq. in., and a separate oil pressure pump is provided so that the brakes can be used as lifting jacks to raise the rotor.

Structural Features

The structural features of the unit have been so arranged that the operating floor is level with the top of the generator frame instead of with the base as is customary. This arrangement has several advantages as it not only tends to lessen the windage noises but permits the control of the warm air discharged from the generator. The cooling air, which amounts to 100,000 cu. ft. per minute, is drawn from the wheel pit through radial tunnels and may be discharged from the generator outside the building in the summer, or into the operating room in the winter when warmth is desirable.

The control apparatus for the generator and turbine will be located on the generator room floor. It is worth noting that in modern station design there is a tendency to place the control apparatus on the operating floor. This reversion to the arrangement followed in the original hydro-electric stations is made possible by the design of enclosed and quiet running machines.

Electrical Connections

The keynote of the electrical connections has been simplicity. Each generator will be connected directly to the low-tension side of its transformer bank without any intermediary oil-circuit breakers, which virtually makes each generator and its transformer bank one unit. The 11,000-volt cables from the generators to the transformers are carried in fibre conduits. There are nine single-phase cables per unit, arranged with the three cables of each phase in a vertical plane. This arrangement gives the

STATOR FRAME FOR SHAWINIGAN UNIT — WEIGHT, 95,000 LB.—ON 35 FT. BORING MILL

ate shafts and coupled together on account of the enormous weights of these parts.

The main bearing is of the General Electric spring thrust type, consisting of a lower disc with a polished steel surface, split into sectors and supported on a great number of small helical springs on which rubs an upper, solid,

best current distribution among the conductors; although owing to the different reactance of the conductors in different positions, the reactance drop is not the same in all cables, yet the difference is not great enough to cause overheating of any one conductor.

Disconnecting switches are provided in the 11,000-volt cables to facilitate the making of tests.

There will be two 110,000-volt circuit breakers connecting the transformers to the high-tension bus, as it was considered inadvisable to depend on one switch for so large an amount of power. These breakers are each to be placed in a separate chamber which can be completely shut off so that the effect of a possible fire or explosion may be localized. Provision will be made to ventilate the switchrooms by small electrically driven exhausters, so as to prevent the accumulation of inflammable gas from the vaporizing of the switch oil.

GRAVEL AND STONE ROAD MAINTENANCE*

Difference Between Repair and Maintenance of Gravel Roads — Screening Equipment — Gravel Used in Elgin County — Shaping Roads in Spring

By F. Pincio,

Elgin County Road Superintendent.

ROAD maintenance consists of keeping it as nearly as practicable, in the same condition as it was when originally made; the repair of a road is the work rendered necessary to bring it up to its original condition after it has deteriorated by neglect. Thus there is a wide distinction between the two operations, and when the comparison of costs is made, errors are frequently caused by setting the repairs of one road against the maintenance of another or vice versa.

No matter how well made a structure may be, or how carefully the materials have been inspected, after being used it will exhibit defects which it is almost impossible to guard against, such as variability in the quality of the material and slighting on the part of the workmen. Moreover, every material, whether natural or artificial, is continually undergoing a process of deterioration by the action of the elements; this decay is hastened or retarded in proportion to the means employed and care bestowed to arrest it.

The crown of the road should be sufficient to allow water to pass freely to the ditches on the side of the roadway. On many of our gravel roads in Elgin county, the shoulders were higher than the centre of the road. These have been thrown outward and either spread uniformly along the sides or drawn to some narrow or dangerous point on the road. Where the shoulders of the road are high, it makes impracticable the use of the most necessary implement for the maintenance of a gravel or earth road, the split log drag. After the shoulders have been thrown outward, the grader is then reversed and if there is any good material, it may be drawn to the centre of the road. Great care should be taken that no sods or poor, worn materials are thrown into the centre of an old gravel road.

Roads Resurfaced with Screened Gravel

Resurfacing should be done with nothing but the best grade of screened gravel, well spread out free from earth or any stones that will not pass through 1½-in. ring. In Elgin we have 256 miles of county road, of this mileage about 190 miles is gravelled; 25 miles is either macadam or stone road, and the balance is clay or sand. We own five gravel pits, these are located in different parts of the county with the view of trying, as near as possible to furnish material for the entire county highways and not have the haul exceed more than ten or twelve miles.

Semi-portable bin, elevator and screen is used for re-

moving large stones and makes loading of trucks and teams quickly done, the bin holds 30 tons, the floor or bottom of the bin has a slope of about 50 degrees, so that the gravel will slide to the opening or shut on the side of the bin. The gravel screen is 9 ft. long, all in one piece with 3 ft. perforated with ¼-in. holes for sand, 3 ft. blank, to carry gravel across bin which is 12 ft. wide and 3 ft. of 1½-in. holes, in this manner the gravel becomes all mixed from a reasonable portion of sand to any stone that will not pass through a 1½-in. ring where the gravel drops into the bin. The elevator is the bucket type 32 ft. long with hopper at bottom, gravel is brought from the bank with the ordinary slush or slip scraper drawn by a horse and dumped into the hopper, the horse passing directly over the hopper which is protected by grizzly bars.

A regular gang of men are employed in this work during the working months in the year, they are furnished with portable cook house, sleeping tents, etc., this equipment takes care of the whole gang including the truck drivers. We handle from 125 to 160 tons of gravel per day.

Truck Loads

Teamsters usually haul about one and one half yards to the load and are instructed to make four dumps of this size load, spread it at least 10 ft. wide and in this manner one load of gravel will cover about 10 ft. of road, in length. The trucks are of the dump body type carrying a load of five yards, which load will cover about 200 ft. of road in length, 6 ft. wide, in some cases three widths of gravel are put in by the trucks making a spread 18 ft. wide.

In Elgin county gravel is the natural road building material. While this may not be the best type of road to construct I believe that we can build enough extra miles of fairly good road to travel on than they would if we were to expend our money on a more permanent road in a small mileage. The County of Elgin has no road roller, nor do I see any use for one as long as we continue our present method of constructing and maintaining gravel roads. A gravel road is very apt to break up during the early spring, but it is only a matter of a few days and if properly attended to at the right time, it will come back in its original shape, therefore emergency of this kind should be provided for by having storage gravel piled along side of the road which can be quickly put on if necessary.

Early Spring Best Time For Road Repairs

The writer has found that the early spring is the proper time to go over gravel roads and shape them for the coming summer. Where a gravel road is inclined to be wavy our method for levelling is to use the standard size grader, turn the blade crosswise of the road and plane the unevenness down in this way. This can be done in the early spring. If we find the roadbed too hard for the blade we remove it and attach a scarifier on the grader where the blade has been. After the roads have been shaped in this manner, the ordinary split-log drag will keep them in a fair condition for the balance of the summer, providing that enough shifting material of gravel is on the road which is quite necessary in order to maintain a gravel road. Gravel should never be placed on an old gravel road more than 2 in. in depth, never get too much gravel on the road in one place and let the traffic roll out the road instead of a road roller. A patrolman should be appointed about every two and a half miles, furnished with a split log drag or small grader.

Hon. F. C. Biggs, Minister of Public Works and Highways, stated recently that there is now 49,785 miles of metal surfaced roads in Ontario, 23,166 being gravel roads and 566 miles permanent highway. He promised that by the end of the present year the foundation would be laid for a permanent highway from Windsor to the Quebec boundary.

*Paper read at the 125th Annual Conference on Road Construction, Toronto, Feb. 27-28.

EFFECT OF SPEED ON HIGHWAYS*

Road Surface Effected By Speed — Impact on Pavements —
Tractive Resistance of Various Pavements — Variation
Of Speed Limit in Different Provinces

By W. G. Robertson,

Secretary-Treasurer of the Ontario Motor League.

IT HAS been estimated from available statistics that the volume of road-borne traffic in Canada is ten times that of the rail-borne traffic. There is no need to discuss the relative importance of the railway and the highway, both are essential, each being the complement of the other, but as speed is admittedly a prime factor in railway operation, it is worth while to consider this factor in relation to the highways which carry the great bulk of the traffic.

Speed, for the purpose of this discussion, will be taken in the sense, rate of travel or velocity rather than in the sense, to make haste, perhaps unnecessarily. Let me say here that so far as "speeding" or exceeding the speed limit is concerned, the Ontario Motor League, which organization I have the honor to represent, stands for the same observance of the law and advocates a reasonable regard on the part of all motorists for the rights of others using the highways. Safe driving and courtesy under all circumstances are expected by the League of all its members.

There are many angles from which the question of speed of motor vehicles may be considered. It might be taken up from the standpoint of engine efficiency and fuel economy; from the standpoint of tire efficiency and economy; from the standpoint of experience and skill on the part of the driver; with regard to the factor of safety, or with regard to the effect of speed on road surfaces. Each of these various aspects of speed is worthy of serious thought and capable of considerable elaboration, but it will be necessary for the present to confine our attention largely in the aspect in which the Good Roads Association is chiefly interested, the effect of speed on road surfaces.

It is well known that speed is a very important factor in the amount of destruction which results from the unrestricted use of the roads by vehicles. The impact increases very rapidly with increase of speed. It increases much more rapidly in the case of a truck equipped with solid tires than one equipped with pneumatic tires, because of the greater resilient qualities of pneumatic tires.

A report issued by the United States Bureau of Public Roads on the "Effect of Impact on Pavements" gives some interesting information on this subject, and shows that the impact resistance increases with the velocity, with the total weight of the vehicle, and with increasing road-surface roughness. In these tests, the impact resistance of good asphalt or bitulithic or other smooth pavement, was practically negligible, and reached its highest values on granite-block roads with sand filled joints, and on badly worn macadam pavements. The rate of increase of impact resistance with speed was most marked on the roughest roads.

Tractive Resistance

The following urban pavements are enumerated in the order of their desirability for vehicle operation from the point of view of tractive resistance at 20 km. (12.4 miles) per hour, as found in this investigation. (1) asphalt, (2) wood block, (3) hard smooth macadam, (4) brick block, (5) granite block with cement-filled joints, (6) cinder, (7) gravel, (8) granite block with sand-filled joints.

The equivalent grade at 120 km. (12.4 miles) per hour of a badly worn city macadam road, was found to be nearly three times as great as that of the best asphalt road tested. This means, at this speed, a consumption of energy at wheel treads, of nearly three times as much on level macadam roads as on good level asphalt roads.

Increasing the gross weight of the vehicle by 12 per cent. through load, was found to have no effect on tractive resistance within the observed speed limits for smooth roads in good condition, but on rough roads, a distinct increase in tractive resistance with this extra weight was observed.

Effect of Speed on Road Surface

Tests have been made which show that increased speed of a vehicle equipped with hard rubber tires tremendously increases the impact which its wheels make on the roadway where there is any unevenness. On the other hand, where pneumatic tires are used, increased speed adds comparatively little to the impact. It has been suggested that these tests will be of great value not only in settling questions of design, but may also lead to a rational basis for determining license fees for motor vehicles.

Trucks have been used in these tests varying in size from a 1-ton up to a 7½-ton truck carrying an excess load. Each truck was run over a special recording device imbedded in the roadway and the impact which resulted, when one of the wheels made a two-inch drop from a ledge built in the surface, was recorded.

Recent tests were made with a 3-ton truck loaded so that the weight on each rear wheel was 7,000 lbs., the unsprung portion being 1,700 lbs. and the sprung portion 5,300 lbs. The truck was equipped first with an old solid tire that was worn down to a thickness of one inch. Then, with exactly the same load on the truck, a wheel was fitted with a new solid tire 2½ inches in thickness. And finally, the truck was equipped with pneumatic tires 42 by 9 in., blown up to a pressure of 142 lb. per sq. in. The following table shows very clearly the bad effect an old tire is likely to have on a road surface and the greatly lessened impact which is produced by trucks equipped with pneumatic tires. The tests show that as the vehicle's speed was increased, the impact from the old hard rubber tire increased greatly. The impact from the new tire was somewhat less.

Speed M.P.H.	Old Tire Lbs.	New Tire Lbs.	Pneumatic Tire Lbs.
5.7	11,600	9,400	7,000
10.2	18,500	14,100	7,900
14.6	26,500	18,700	8,330

In fixing speed limits for motor vehicles, Legislators hitherto have given consideration mainly to the question of safety. Diversity of opinion as to what constitutes a safe maximum speed is reflected in the variety of legislation on this subject in different provinces and states. The State of Kansas sets 40 miles per hour as the upper limit of speed in the open country. California and a number of other states draw the line at 35 miles per hour, while 30 miles per hour is about the average for all the states.

Speed Limits

Thirty miles per hour is the maximum speed limit in British Columbia, while the other Western Provinces fix no limit other than requiring speed at all times to be reasonable, having regard to traffic. In Ontario, Quebec and Nova Scotia, the upper limit has been fixed at 25 miles per hour. New Brunswick sets no definite speed limit other than what is reasonable, having regard to traffic, while Prince Edward Island, but recently opened up to the automobile, puts the ban on a speed in excess of 15 miles per hour.

In Ontario, the Load of Vehicles Act (Section 5) stipulates that no vehicle carrying a weight in excess of four tons, including the vehicle, shall be operated on any highway at a speed greater than ten miles an hour; and no vehicle carrying a weight in excess of six tons, including the vehicle, shall be operated upon any highway at a speed greater than eight miles an hour.

The speed limits for trucks provided in the Ontario Act are extremely restrictive. If modified in conformity with recent experience, all commercial vehicles equipped all around with pneumatic tires would be restricted to 25 miles per hour on open country highways, while commer-

*Paper read at the Annual Convention of the Ontario Good Roads Association, Toronto, March 2.

cial vehicles equipped partially or all around with solid tires, would be required to conform to the following speed schedules:

Gross Weight	Open Country
Under 2 tons	Highways
2 to 6 tons	25 miles per hr.
6 to 10 tons	20 miles per hr.
10 to 14 tons	15 miles per hr.
	12 miles per hr.

To fix the speed limit of commercial vehicles at an extremely low figure, means also interference with the free movement of general traffic on the highways. On a road of average width, when there is a steady stream of traffic in opposite directions, it is at once both difficult and dangerous to pass a succession of slow-moving vehicles, in the face of oncoming traffic. The great increase in motor traffic indeed points to an early necessity of providing such width on main highways as will enable trucks and slow-moving vehicles to travel the outside of the road, and leave a lane of sufficient width for two lines of the more swiftly moving passenger cars. Under present conditions it is just a question whether it might not be conducive to safety to require all motor vehicles to travel at not less than a minimum rate of say twelve miles an hour under normal traffic conditions.

Factors Affecting Speed of Vehicles

Width of highways, degrees of grades and curves, nature of road intersections, ditches, and railway crossings, and volume and kind of traffic, are all factors which must be considered in determining speed from the standpoint of safety. So complex are these factors that it is impossible to state what might be considered a reasonable speed on any but a straight-away stretch of country road, without taking into account local conditions. Vigilance and sound judgment are essential to safe driving everywhere and no arbitrary speed limits can be devised which will relieve the drivers of motor vehicles from the ever-present obligation of giving due regard to constantly changing traffic and road conditions.

ONTARIO GOOD ROADS ASSOCIATION

TOWNSHIP, county, town and city officials from all parts of Ontario met at the Ontario Veterinary College, Toronto, on March 1, 2 and 3 for the twentieth annual meeting of the Ontario Good Roads Association.

T. J. Mahony, of Hamilton, president of the association, occupied the chair throughout the sessions. At the first session, on Wednesday morning, nominating and resolutions committees were elected. The report of the executive committee was received and various questions and resolutions were submitted by the delegates.

On Wednesday afternoon, addresses were delivered by Hon. F. C. Biggs, minister of public works for Ontario; Hon. Harry Cockshutt, lieutenant-governor of Ontario; Prevost Hubbard, chemical engineer of the Asphalt Association, New York City, and T. J. Mahony, president of the Ontario Good Roads Association.

W. G. Robertson, secretary of the Ontario Motor League, opened the Thursday morning session with a paper on "Speed on Highways." Mr. Robertson was followed by Controller Russell Nesbitt, of Toronto, who welcomed the delegates to the city and assured them that Toronto realizes what good roads mean to her citizens. G. C. Parker, of the Ontario Department of Public Highways, read a paper on "Headlights." G. F. Pineo, road superintendent of Elgin County, spoke on "Highway Accounting"; and F. H. Richardson, warden of Ontario County, delivered an address entitled "Provincial Highways, How Should They be Paid For?" Mr. Richardson discussed the justification for direct taxation and the question of whether there should be a provincial equalization of assessment.

W. A. McLean, deputy minister of highways for Ontario; Hon. J. L. Perron, minister of highways for Quebec; K. W. McKay, clerk of Elgin County; E. A. James, chief

engineer of the Toronto and York Roads Commission; and D. J. Kean, superintendent of highways for Ontario, also delivered addresses at the session on Thursday afternoon, and at 7:00 p.m. the annual banquet of the association was held in the Pompeian Room of the King Edward Hotel.

At the last session of the convention, which was held on Friday morning, there was a round-table discussion on township roads, lead by the following superintendents:

Silas Toole, Pickering Township; Peter Upcott, South Gosfield Township; James Todd, Yarmouth Township; J. D. Flanders, Dereham Township; Walton Smith, Nepean Township; James Hunter, Nelson Township; and Wm. E. Hambly, Townsend Township. Among the topics discussed were maintenance, construction, highway accounting, and the abolition and commutation of statute labor.

After the presentation of the reports of the committee on resolutions and of the nominating committee, the following officers were elected for the ensuing year:

Honorary presidents, Capt. Lucius E. Allen, Belleville, and T. J. Mahony of Hamilton; president, W. H. Brown of Bruce; first vice-president, John Currie, Middlesex; second vice-president, Geo. S. Henry, York Township. Directors—J. E. Jamieson, Simcoe; F. A. Senecal, Prescott; W. H. Nugent, Hastings; Alvin Rose, Brant County; P. Ray, Wentworth County; and Fred Richardson, Ontario County.

ONTARIO'S COUNTY ROAD SUPERINTENDENTS HELD EIGHTH ANNUAL CONFERENCE.

UNDER the auspices of the Ontario Department of Public Highways, the county road superintendents of that province held their eighth annual conference on road construction at the Parliament Buildings, Toronto, on February 27 and 28.

Hon. F. C. Biggs, minister of public works and highways for Ontario, welcomed the members of his staff and emphasized the importance of county and township roads, as distinct from the provincial system. He called special attention to the need for adequate drainage, for permanent roads of the highest types, and for the maintenance of gravel and other temporary roads.

W. A. McLean, the chairman, expressed pride in the work of the highway engineers of Ontario and in the system of roads that is being obtained as a result of their efforts. The subject for the first session, "Concrete Bridges and Culverts," was well covered in a paper by W. J. Moore, of Renfrew, the discussion being introduced by John Young, of Wellington, and D. J. Kean, of Ontario County.

Tuesday morning's session commenced with a paper on "Concrete Road Surfaces," by L. A. Pardo, of Kent County, followed by a short introductory talk on the subject by L. S. Litche, of Waterloo. Frank Pineo, of Elgin County, read a paper on "Gravel and Stone Road Maintenance." The discussion was introduced by R. H. Fair, of Frontenac, and S. Fox, of Hastings.

"Bituminous Road Surfaces" was the subject of a paper presented by Alan K. Hay, of Ottawa, at the concluding session, on Tuesday afternoon. G. Marston, of Norfolk, and Wm. Waters, of Lanark, opened the discussion. Frank N. Rutherford, of Lincoln, delivered a paper on "The Early Preparation of County Road Programs." The discussion being opened by E. L. Miles, of Victoria, and N. L. Powell, of Peel County.

Following his assurance to the House that preliminary steps would be taken to look into the matter of Chippawa costs, Premier Brury, it is understood, is calling into consultation the firm of Stewart and Kerbaugh, the well-known American consulting engineers. The firm of Stewart and Kerbaugh was one of those engaged by the Hydro-Electric Commission to report upon the Chippawa work, and the estimate of \$55,000,000 given to the House last session, and which has now been exceeded, was to a large extent, the estimate of that firm.

HIGHWAY DRAINAGE AND THE APPLICATION OF DRAINAGE ACTS*

Sub-Base Drainage Problems—Procedure Followed in Carrying Out Drainage Schemes Under Ditches and Watercourses and Municipal Drainage Acts

By U. W. Christie,

Dufferin County Engineer.

DRAINAGE besides carrying off the surface water from the road reduces the water content of the sub-grade and improves the foundation. Road failures have largely been the result of weak foundations at the time frost is coming out of the ground, when the water content of the soil is high and foundations are consequently weakened. If we except the Telford and probably some other large stone and sub-base types of road, foundations have not been built with large enough interstices to resist capillarity. Hence the water level must be lowered an amount to overcome capillary action, just how much depends upon the character of the subsoil. In light soils the water rises rapidly and falls rapidly, in heavy soils it rises more slowly and falls more slowly. In light soils the percent of water in the soil decreases rapidly with the height above the source, while in some heavy soils the water content is strikingly uniform at different depths.

Horizontal capillarity occurs with much faster water movement and greater uniformity of moisture content. The speed and distance vary with the different soils and ranges from 7 to 33 ft. in the first 24 hours. The rapidity with which capillary action occurs when there is a free source of water makes it necessary to remove this source with the greatest promptness if a substantial road foundation is to be maintained.

Height of Sub-grade Above Water Surface

If it is absolutely necessary to allow water to stand or flow along a road for even a few hours, the height of the sub-grade above the surface of the water and its distance horizontally from the water source must be considered.

For water on the side of a road for one day at a time, we would require a height of subgrade of about 18 in. and if the horizontal distance was large we might reduce this; but if the road were alongside a pond or lake or any body of water that remained for a considerable time, the height of subgrade above the surface of the water would have to be increased to a height of 3 or 4 ft.

In grading the practice has been to excavate from the sides of the road to raise and form the grade, if these trenches have not a continual fall to outlets where water will run freely away, they are not drains but elongated ponds which hold the water and permit it to soak into and soften the roadway. Water must be made to flow from the road as quickly as possible. Trenches should not be carried along the side of the road and past outlets as has frequently been done. Water should be discharged in small quantities into frequent outlets. Culverts should be so placed that water carried across the road will be carried off the road directly from the culvert.

Use of Tile Drains

Tile drains should be made use of to carry water away from all springy or soft spots in the foundation and to intercept water likely to reach the foundation. A tile drain should always be placed on the higher side of a side hill road, if there are indications of water trouble and often on the face of a hill, in the latter case the drain may be in the centre or to one side of the road. Tile drains should be about 3 ft. deep, should be laid carefully to grade and should be covered with an open material such as gravel, crushed stone or cinders, if in quicksand the tile should be laid on boards and cinders should be used in preference to gravel or stone.

Where a tile drain is required to carry off surface water, it should be at least 6 in. in diameter and for this purpose ordinary porous field tile are not suitable, the tile should be concrete or vitrified pipe with bell and spigot ends or some other approved form of joint and each pipe should have a laying length of 2 ft. The surface water should enter through catchbasins, the floor of which should be 2 ft. below the invert of pipe. A cheap way of building these is to place 24 in. diameter pipes in vertical column and place 4 in. of concrete in the bottom and a cast grid on top. Catchbasins should be cleaned out frequently to insure the tiles remaining open.

Obstructions that will impede the free flow of water should be removed from culverts and drains at frequent intervals and a special effort should be made each fall to see that this is done and also to see that fences are removed from all drains.

In most county road drainage problems, other roads and lands are affected and the machinery for initiating, carrying out and distributing the cost of these is provided for in our Ontario Drainage Acts of which there are two, the Ditches and Watercourses Act and the Municipal Drainage Act. The former is for the smaller undertakings and for forcing an outlet, and the latter for the larger undertakings.

Work that may be undertaken under the Ditches and Watercourses Act is limited to a cost of \$1500 and to a length of 7 township lots. The land, the owners of which may be made liable for the construction, is that lying within 150 rods of the sides and upper end of the drain.

The owner of higher lands has not the right to construct the drain to dump water on lower lands and if such a drain be constructed the owner of such lower lying lands may block up or dam such a drain. In fact the owner of the low lying lands may block back a surface flow of water, but not a natural watercourse. Drainage may only be undertaken by agreement of owners or by the legal application of the drainage laws.

Ditches and Watercourses Act

A party requiring an outlet and wishing to proceed under the Ditches and Watercourses Act would proceed as follows: He would file with the clerk a declaration of ownership, and would obtain from him a form of "Notice to Owners of Land Affected by the Proposed Ditch" and also a form of "Agreement of Owners." The notice of owners he would fill out sign and serve personally, or leave with a grown up person at the usual place of abode of the owner or occupant; in the case of a non-resident he would serve the notice upon the agent of the owner or send by registered post to the post office nearest the place of his last known residence, and where his place of residence is not known, then notice may be served as directed by the Judge. The notice should name a day and hour and also a place convenient to the proposed ditch at which the owners are to meet and if possible come to an agreement as to the apportionment of the work and supply of material for construction. The time between the serving of the notice and the calling of the meeting shall be at least two clear days, the day of serving and the day of the meeting do not count. Parties notified have 5 clear days after service to apply to the county judge to set aside proceedings on the ground that the person commencing proceedings is not an owner within the meaning of the Act. If no such application is made or is made and is not successful, the ownership is thereafter not open to question.

If an agreement is arrived at, it shall be reduced to writing and filed with the clerk within six days after the signing thereof. Should two or more municipalities be affected the agreement shall be in duplicate or triplicate, etc., and one copy shall be filed with the clerk of each municipality.

Should it happen at the meeting of owners that notices were omitted or improperly served the owners present may adjourn the meeting to a subsequent date to allow the notices to be properly served.

*Paper read at the Eighth Annual Conference on Road Construction, Toronto, Feb. 27-28.

The head of council of any municipality may sign the agreement as owner. If an agreement is not arrived at by the owners at the meeting or within five days thereafter, the owner requiring the ditch may file with the clerk of the municipality a requisition, naming therein all the lands that will be affected and the respective owners thereof requesting the engineer to appoint a time and place at which he will attend to examine the premises, parties and their witnesses, if any.

The clerk shall notify the engineer, who will in turn notify the clerk of the time and place at which he will attend. The clerk files the copy of the appointment of attendance of engineer and sends one copy by registered mail to the party making the requisition, who shall, at least four clear days before the time appointed serve notice upon the other owners requiring their attendance. After the service of these notices the party shall indorse on one copy the time and manner of service and leave with the engineer at least the day before the date fixed in the notice of appointment.

The engineer will attend at the time and place, examine the premises and if he considers a ditch necessary will lay it out. In due time he will file his award with the clerk, who shall notify each of the persons affected within the municipality by registered letter or personal service, of the part of work to be done and material to be furnished by each person.

Any owner affected by the award may within 15 days of the notice of the filing of the award appeal therefrom to the judge. The appellant shall serve upon the clerk of the initiating municipality a notice in writing of his intention to appeal, shortly setting forth the grounds for appeal. The clerk will notify the judge of the appeals and will furnish him with a copy of the award. The judge will fix a time and place to hear the appeal at which he may set aside, amend or affirm the award. The order of the judge shall be filed with the clerk and the award as altered or affirmed, may be enforced in the same manner as the award of the engineer.

If the drain be not completed at the time specified in the award, the engineer may let the work and the supply of material to the lowest bidder and the cost shall be borne by the parties failing to comply with the award.

The drain shall be maintained by the parties whose lands have been awarded maintenance, and any owner who fails to do so may be notified in writing by any other owner party to the award to have his portion put in repair within 30 days from the receipt of such notice; and if the repairs are not made and completed within such 30 days, the owner giving the notice may notify the engineer in writing, to inspect the portion complained of. The costs of enforcing maintenance are collected in the same way as costs of construction.

Municipal Drainage Act

Under the Municipal Drainage Act, new work must be undertaken by a petition, which must be signed by a majority in number of the resident and non-resident persons exclusive of farmers' sons and others not actual owners, as shown by the last revised assessment roll to be the owners of the lands to be benefited in any area described in such petition within any township, incorporated village, town, or city, to the municipal council thereof, for the drainage of the area described in the petition.

The council procures an engineer or Ontario land surveyor to make a report which would include an estimate and recommend an assessment on the owners of lands and roads. Upon the filing of the engineer's report with the clerk of the municipality, the clerk shall by letter or postal card to notify the parties assessed of such assessment and the amount thereof, and the date of the council meeting at which the report will be considered. The engineer's report shall be of as many copies as there are municipalities affected and the initiating municipality shall notify each other municipality.

At a meeting for considering the report the clerk shall read the report to all the ratepayers in attendance and an opportunity shall be given to any person who has signed the petition to withdraw in writing and an opportunity shall be given to persons who have not signed the petition, to do so. Should the petition at the close of the meeting contain the names of the majority of owners, the council may proceed to adopt the report and pass a by-law authorizing the work, but if after striking out the names of the persons withdrawing, the names remaining including those added do not represent the majority of owners according to section 3 of the Act, then the persons who have withdrawn from the petition shall on their respective assessment on the report, with 100% added thereto, together with the other original petitioners, be pro ratio liable to the municipality for all expenses incurred.

For repairing drains constructed under the Act it is not necessary to have a petition, a simple resolution of council is all that is required and any one having a grievance owing to the non repair of a drain simply makes application to his council, whose duty it is to have repairs made.

In the case of reports by an engineer for a new drain or for the repairs of an old drain under Sections of the Act, where the assessments are varied from their original proportions, there are appeals.

- (1) By individuals.
 - (a) To the Court of Revision.
 - (b) To the County Judge.
 - (c) In certain cases to the drainage referee.
- (2) By municipalities in case of two or more municipalities being affected.
 - (a) To the drainage referee.
 - (b) To the High Court.

REPORT OF SASKATCHEWAN HIGHWAYS

A REPORT of the Department of Highways of Saskatchewan has been issued covering the work of the department for the season of 1921. The following information has been taken from the report. The department assists rural municipalities in the construction and maintenance of main roads, the work being done either by the municipality under departmental supervision or by the department, the expenditures being charged to capital account. The department also carries out similar work in unorganized districts. During 1921 the department entered into 959 contracts with rural municipalities, the expenditure being \$538,000, and in addition carried on 476 separate pieces of road work costing \$357,000. The department also assists rural road maintenance by grants to each of the 300 rural municipalities, the grants varying according to area but averaging \$500. Under this head the 1921 expenditures were \$145,000. For road construction on the provincial main road system under the Canada Highways Act the year's expenditure will be \$534,000, of which the federal government pays forty per cent.

The mileage was, Under contract, 225 miles of earth road, costing \$320,000; by day labor: 95 miles of earth and gravel road, costing \$214,000. Preliminary surveys for future work under the Canada Highways Act have been completed for 1,075 miles. On the construction or repair of 140 timber bridges the expenditure will be \$153,000, while 12 permanent bridges have been built at a total cost of \$155,000, and seven steel trusses erected at a cost of \$48,000. Other sundry expenditures are: Road drag competition and high posts, \$20,000; ferries, \$115,000; fireguards, \$1,000; water supply, \$15,000; surveys, \$47,000; drainage works, \$30,000, a total of \$228,000 for sundries.

The uniform wage schedule adopted by the Western Builders' Convention held at Calgary has been endorsed by resolution of the Association of Building and Construction Industries of Moose Jaw.

STONE ROADS MAINTENANCE*

Advocates Water-Bound Roads — Gang System for Repairing Gives Better Results Than Patrols — Maintenance Work for Three Seasons

By E. A. James,

Chief Engineer, Toronto & York Roads Commission.

DURING the last two years the type of construction on our main roads has so improved that we have heard little or nothing of stone roads, but there are many miles of stone roads to be built which, if properly constructed and maintained, will give excellent service.

While agreeing that for heavy traffic on a few of our main thoroughfares, concrete or a concrete base with a bituminous top is the only economical form of construction, yet the writer is just as thoroughly convinced that this type of construction on lesser travelled roads is at present a waste of both energy and money.

Stone roads may be divided into two classes.

- (a) Stone roads bound by traffic;
- (b) Stone roads water bound.

While the writer does not advocate the construction of roads of the former type, yet we find that many miles are still being built, and with a medium hard stone and iron tired traffic, it is surprising how quickly they bind and re-bind. Their maintenance, however, must necessarily be somewhat haphazard, as one cannot estimate just how they will act under traffic. Holes should be filled with 1-in. stone, sprinkled with limestone dust or loam. The sides of the road should be kept well shaped so that water will run quickly to the ditches. Oiling may be adopted similarly, and similar methods to those used on water bound macadam. We are, however, dismissing the maintenance of this type of road with a few words. Firstly, because this type is not economical either in construction or maintenance, and secondly because the remarks on the maintenance of the second type may be applied, with slight modification, to the maintenance of roads of the first type.

Patrol and Gang Systems

In maintaining roads, two types of organization have been adopted, namely "patrol" and "gang." Both systems have merit, but in our experience the gang system has given better results.

In the patrol system, one man or at most two men, have a small mileage to look after, and we have found it very difficult to secure a man who is a good workman and of the temperament that makes it possible for him to work steadily day after day alone, patching and cleaning up along the roadside. Although he works conscientiously, we find that without someone with whom he can compete he becomes slower and slower, until although he is busy all day he only does from one-half to three-quarters of the work a man should do.

By adopting the gang system, we find that by using very light motor trucks we can give a foreman twenty to twenty-five miles of road, and from four to five men. Under this system we can secure foremen of greater ability and with more initiative, and there is companionship and rivalry among a man and his gang and between gangs, which tends both for efficiency and economy.

On stone roads well built, there are several months in a year when little or no maintenance is necessary and the gang can be used to construct small culverts, do light grading or build short stretches of improved road. In this way the foreman and his men maintain their interest in road work, and we have found that the men who have had experience in road building are, without exception, the best men to employ on road maintenance.

The advocates of hard surface roads make the statement that the maintenance of a stone road commences the day after it is built, and while this statement is true and should be emphasized, yet it does not deter us from building stone roads.

First Season Maintenance

The maintenance for the first few weeks after a stone road has been completed, consists of seeing that the limestone film is worn uniformly without removing the filler between the stones. In other words, endeavor to get the traffic to distribute itself over the full width of the pavement. With the first indications of travelling, oiling should be commenced. This first oiling consists of spraying with a light asphaltic oil, say 40% bitumen, applying approximately one-third of a gallon per square yard, and then sanding the applied oil. During the first season only light oils should be used on stone roads, otherwise there is danger in forming cakes on top of the limestone film, which break and cause the road to pit. Such a stone road, oiled in this manner, will take legal traffic up to 75 motor cars and 100 horse-drawn vehicles per hour. The second step in this maintenance will occur the following spring, when a few holes may develop, due to the unequal rolling or stones of unequal size being used. These holes should be cleaned out, the loose stone removed, and the hole patched with 1½-in. stone, bound in place by bitumen poured hot, using approximately 14 gallons of bitumen per cubic yard of stone. It is well not to use too much bitumen, nor to fill the hole too full, otherwise there is a tendency to shove. The patch should be pounded with a hand pounder. The second method of patching is to use K.P., which is a bitumen that may be mixed with the stone cold, and the mixture thus formed tamped into the hole that has been properly cleaned and shaped. In this case it is better to use a mixture of ½-in. and ¾-in. stone, thus producing a dense aggregate.

Maintenance During Second Year

During the second year, it will always be found a good investment to treat with bitumen the water bound macadam road, and whether it is done before or after the patching is immaterial. It will usually be found, however, that to get the best from carpet surfacing the road should be treated early in the season, before there is time for patching, but this does not spoil the patch work, as the bitumen penetrating the road assists in binding in the patches, whereas if great care is not used in spraying, bitumen applied on top of the patches cuts back the binder in the patches causing them to shove. The second year treatment should be preceded by careful sweeping to see that all dust, dirt and film has been removed. This may be done with the aid of hand brooms, or by using horse-drawn revolving brooms. Care must be taken, however, not to sweep so vigorously as to disturb the stone.

The weight of the carpet coat for the second year will depend upon the character and intensity of the traffic, but a tar having the consistency of Tarvia "B" or a 65% asphalt sprayed evenly and hot; 1/3 of a gallon to the yard and 30 lb. of ½-in. chips or pea gravel per square yard, will mat into a wearing surface that will carry the traffic of our leading highways, 400 motor cars and 75 horse-drawn vehicles per hour. In the fall the necessary patch work should again be carried out, when it will be found that the carpet coat has ironed out into a perfect mat.

Third Season's Work

The third season, patching in the Spring as before will be required, but the carpet coat can be reduced to 1/6 of a gallon of bitumen per sq. yd., and the stone to 10 lb. per sq. yd.

Thin repairs may be made by spraying from a watering can hot bitumen, and sprinkling with ½-in. chips or pea gravel. Where the road is covered with a mat of bitumen, this surface patching is very advantageous, as it prevents holes developing.

*Paper read at the Ontario Good Roads Association meeting, Toronto, March 2.

REPORT OF COMMITTEE ON TOWN PLANNING

Report Presented at Association of Ontario Land Surveyors' Meeting, Toronto, Feb. 21-23

By Horace L. Seymour, O.L.S.

Chairman of Town Planning Committee

FOR several years papers and reports relating to town planning have been presented at the annual meeting of the Association. In this work T. D. LeMay, city surveyor, Toronto, has been the pioneer. His broad definition of town planning is "a willingness to do one's duty towards one's neighbor." If we accept this definition every citizen should be a town planner in the widest sense of the term.

Town planning deals not only with material things but with human and social relationship. In the narrower sense of the term, the surveyor has a function to perform in town planning in a technical way. To be successful, however, he must have the broad outlook which Mr. LeMay embodies in his definition of town planning.

The report of your Committee on Town Planning this year consists of short reports from the members of the Town Planning Committee on town planning activities in various sections in Ontario. As proposed, the programme was as follows: Northern Ontario, G. M. Summers, Hailbury; Southwestern Ontario, J. J. Mackay, Hamilton and F. N. Rutherford, St. Catharines; Toronto and vicinity, T. D. LeMay, A. J. Van Nostrand and N. D. Wilson, Toronto; Eastern Ontario and general, Horace L. Seymour, Toronto.

Northern Ontario

We were very fortunate in hearing from H. T. Routly, on "The Development of Townsites in New Ontario." In the past I believe there are some surveyors who have looked on town planning as something of a fad or as something of a luxury. Mr. Routly has shown it to be a matter of stern necessity in the development of the North country. He states that this is not only an opportunity for the town planner but that it is a call of duty to the town planner and we want surveyors to be town planners, or at least to be sympathetic to town planning principles.

In the western provinces, and I am familiar especially with the provinces of Alberta and Saskatchewan, all proposed subdivisions must be approved by the Government and are subject to inspection on the ground. In Saskatchewan, I understand, every proposed subdivision is visited by an inspector. W. A. Begg, surveyor, is town planning director for the province of Saskatchewan. Recently, W. E. Hobbs, surveyor, has been appointed town planning controller under the 1916 Manitoba Town Planning Act, and will approve of all subdivisions. Surely the province of Ontario should delegate to the proper officials full powers in the approval of subdivisions, wherever located and should offer every facility for that approval.

A report covering South Western Ontario was presented by J. J. Mackay, of Hamilton, and another covering Toronto and vicinity was submitted by A. J. VanNostrand and N. D. Wilson. This was followed by an interesting lantern talk on "Maps and Plans of Toronto," by T. D. LeMay.

Eastern Ontario and General

Last year the attention of the members was directed to the assistance of the Town Planning Institute of Canada. There were seventy-five Ontario members. There are eighteen architects, while the engineers and surveyors together total fifty-one, twenty-five engineers and twenty-six surveyors, although some of the latter are now mainly or entirely engaged in engineering. The Toronto Branch although claiming but few regular members, has been doing good work, I believe. A. V. Hall, who spoke on the work at Knapuskasing, is a landscape architect and is chairman of the Toronto Branch. I am glad to tell you that surveyors generally form fifty percent of the attendance at the meeting.

There was held at Toronto recently a two-weeks course in town planning. This was attended almost entirely by others than the ordinary student. There were 48 enrolled—architects 14, engineers 20 and surveyors only 2. All those attending the course seem to have been very much pleased. If continued next year, I hope more surveyors will be present.

The Ontario Town Planning and Housing Conference recently sent a delegation to wait on the Premier. Premier Drury's attention was drawn to the fact that town planning legislation was scattered through various Acts and that in consequence the average municipality did not know its powers. The Premier promised consideration in the consolidation or codification of town planning powers. Town planning activities in Eastern Ontario, as far as I know, have been greatest in Ottawa and Oshawa, two municipalities that have active town planning committees. This is generally true, I think, throughout the province. I might mention the cities of Hamilton, St. Catharines, Kitchener, Waterloo, Guelph, Brantford, Niagara Falls and the Essex Border Utilities Commission.

REPORT OF COMMITTEE ON ENGINEERING, ROADS AND PAVEMENTS

Report Submitted to Association of Ontario Land Surveyors at Meeting in Toronto, Feb. 21-23

By J. M. Empey, O.L.S.

THE PAST year has been a most successful one in regard to the amount and quality of road construction accomplished in the Province of Ontario, by the different systems in operation under the supervision of the Department of Public Highways.

Early in the year many contracts for construction of permanent concrete culverts, bridges and pavements as well as grading of several hundred miles of road bed were entered into by the Department on its 1800 miles system of provincial highways. Similar conditions prevailed in the different counties in connection with county road systems, which received careful inspection and helpful assistance from the Department. The vast improvements resulting from this work had a good influence on all work undertaken by the townships, resulting in better work being done and of a more permanent nature. Greater care is being exercised to remove dangerous turns, narrow places and bad grades, all of which greatly increases the safety as well as the comfort of the travelling public.

Around larger centres like Toronto, Hamilton, London, Ottawa, St. Catharines and Brantford, considerable work has been undertaken and a goodly percentage completed. Programmes have been laid out for further extension in 1922.

Total mileage of roads in Ontario, all types, 23,166 miles.

	Miles
Gravel surface	23166
Stoned surface	3385
Bituminous surface	226
Bituminous Macadam	139 1/2
Asphaltic concrete	43
Concrete	118
Brick	1 1/2

Total mileages in provincial county provincial and county roads, 11,487 miles of which 9,400 miles are surfaced with the following types:

	Miles
Gravel surface	6728
Stoned surface	2161
Bituminous surface	221
Bituminous Macadam	140
Asphaltic concrete	42.7
Concrete	112.5

During the past year the Chippawa Power Canal, one of the greatest engineering works of the world has been

carried forward to a stage which enables them to utilize part of the plant to develop power for distribution. We feel justly proud of this vast undertaking, as it has been devised and developed entirely by our own Canadian engineers.

Considerable progress has also been made in preliminary work on the St. Lawrence deep waterways and power scheme. Considerable progress has also been made with preliminary survey and plans in connection with the International bridge over the Detroit River at Windsor, under one of our Canadian engineers.

Letters to the Editor

JANUARY INDEX NUMBERS

Sir: The price chart which we recently sent you, and which was published in your issue of February 21, was the result of studies made by the Presidents' Conference Committee of the railroads. The credit due this committee was inadvertently omitted from the chart.

The following index numbers for January, based on 1914 as 100, may be of interest:

Average, all commodities, 148; farm products, 116; food, etc., 134; cloth and clothing, 183; fuel and lighting, 183; metals and metal products, 117; building materials, 202; chemicals and drugs, 159; house-furnishing goods, 214; miscellaneous, 146.

L. H. BEAN,

Vice-president, Dwight P. Robinson & Co.

New York City, March 2, 1922.

ARCHITECTS AND FOREIGN MATERIALS

Sir: At the present time when every manufacturing industry in the country is making superhuman efforts to get business and consequently give employment to Canadian workmen, it behoves every architect and engineer who is truly Canadian to employ Canadian products in preparing their specifications.

The following extract is from a recent issue of the "Montreal Herald," and is worthy of publication in your magazine:

"A peculiarly heavy obligation rests upon architects who prepare specifications for materials and equipment.

"In some cases United States architects are employed, and these are in the habit of specifying United States goods, because they are not acquainted with the products of this country. Even in the case of architects of Canadian birth, many have had their training in the United States, and frequently, through lack of information relative to Canadian goods or lack of experience with Canadian products, they call for materials or supplies of United States production."

"In some instances, public bodies which are anxious to support the Made-in-Canada campaign to the fullest possible extent, have allowed specifications to be issued in which imported articles are called for, by direct mention of the name of manufacturers abroad, with or without some qualifying clause permitting the use of some 'equal' alternative. In this way the use of the imported commodities is impressed upon the mind of the contractor and he must take the full responsibility if any objections, justified or unjustified, are made to any alternative goods which he may substitute. Recently the school board of two large Canadian cities issued specifications calling for foreign-made master clocks and signal gongs as equipment for collegiate institutes. These specifications apparently were drawn up by their architects thoughtlessly or in ignorance of the fact that similar equipment, at least equal in quality to, and comparing favorably in price with, the imported equipment, was made by Canadian workers, in plants in

Canada which buy Canadian material and pay taxes in the Dominion."

"There is a duty also upon public bodies, private companies and individuals throughout Canada, to insist that the architects who prepare specifications for them, should call for Canadian products to the fullest extent consistent with the obtaining of satisfactory results at favorable prices. Responsibility also rests upon Canadian manufacturers and other producers to keep architects acquainted with their products by distribution of catalogues or otherwise."

W. E. RAMSAY,

Vice-President,

Pedlar People, Ltd.

Montreal, Que., February 24, 1922.

ENGINEERING PROBLEMS OF BOUNDARY WATERS

PROBLEMS of unusual difficulty in connection with international aspects of the control of boundary waters were discussed recently by J. B. Challies, Director, Dominion Water Power Branch, before the Engineering Society of the University of Toronto. In an impartial way, Mr. Challies outlined the nature of the contentions arising in connection with a considerable number of projects along the border from the Pacific to the Atlantic. Amongst other situations discussed were those of the Pend d' Orielle River which is related to the power situation at Nelson, B.C., the St. Mary and Milk River diversion, on which a decision has recently been reached by the International Joint Commission, the Lake of the Woods control problem, and the power and navigation problem in the international section of the St. Lawrence River, now become a very live issue due to the deep waterway agitation.

TRAINS FOR ROADS CONVENTION

INFORMATION has been issued by W. B. Howard, District Passenger Agent at Toronto for the Canadian Pacific Railway Co., regarding the cost of railway fares for those who expect to attend the annual convention of the Canadian Good Roads Association, which will be held in June at Victoria, B.C.

The summer tourist fare from Toronto, Ont., to Victoria, B.C., and return, limited to October 31, is \$133.30. A lower berth one way, Toronto to Vancouver, costs \$26.25. There is an additional charge of \$10.10 each way for routing via the Great Lake steamers from Port McNicol or Owen Sound to Port Arthur, but in this case the charge for berth is reduced.

Either the "Trans-Canada Limited," leaving Toronto at 9 p.m. June 8, or the "Vancouver Express," leaving at 10 p.m. June 8, will reach Victoria in time for the convention.

For those who desire to return immediately after the close of the convention, it will be possible to be in Toronto at 9 a.m., June 22.

For routing via the Great Lakes, it will be necessary to leave Toronto at 12:30 p.m., June 7, and by this routing the passenger could not arrive in Toronto after the convention until 11:55 a.m., June 23.

That the Ottawa Hydro-Electric Commission passed through a most successful and profitable year in 1921 is indicated by the annual statement and balance sheet submitted by J. A. Ellis, chairman of the commission. It shows a gross surplus for the year of \$61,791.96, after deducting all charges for maintenance and operation, power, interest, and sinking fund on \$700,000 debentures. Except for \$15,054.96, the surplus has all been carried to capital account for depreciations, renewals and extensions, or, in other words, the net surplus was \$15,054.96. The operating report shows revenue for the year of \$328,108.97. The outlook for 1922 is most encouraging, according to the report.

COST DISTRIBUTION FOR THE ST. LAWRENCE WATERWAY

OPPONENTS of the St. Lawrence waterway in the United States are making loud protests concerning the distribution of the cost of the work, representing that it should be on a 50-50 basis, without regard to the economic characteristics of the two participating nations. It is stated that the United States is being asked to put up the major part of the cost of the Canadian waterway and that the proposed distribution of the expenditure is not acceptable to the people of that country.

Consideration of the situation shows that the basis of cost distribution recommended by the International Joint Commission is a most fair and equitable one. It is recommended that international navigation works be maintained and operated by the International Board, while national navigation works be maintained and operated by the country in which they are located, and that power works be built, installed and operated also by the country in which they are situated. The first cost of navigation works is to be apportioned on the basis of benefits received, that is, after a preliminary period of five years following completion of the work, the annual costs shall be assumed on the basis of the freight tonnage of each country actually using the waterway during the previous five year period. Navigation works for the combined use of navigation and power are to be paid for equally by the two countries.

It is difficult to see how a more equitable arrangement could have been discovered. If the United States is to enjoy the greater part of the benefit of the improved waterway for considerable time, surely it should be willing to assume the cost in due proportion to the benefit received. If, on the other hand, the benefits should at any time

be greater to Canada than to the United States there would be no objection on this side of the line to assuming full financial responsibility for such benefits. If it is stated that the waterway is an affair of greater interest and value to Canada than to the United States, then actual use would throw the greater part of the expenditure upon Canada and the Americans could have no possible cause for objection.

Engineering News-Record recently expressed the view that the first cost of the navigation works for the improved waterway would be met largely by the United States, and that the subsequent adjustment after the five year period following construction would apparently affect only operation and maintenance, which would represent a small percentage of the first cost. While we do not know that any definite statement has yet been made by the International Joint Commission on this point, it would seem obvious that the adjusted payments would cover total annual charges, including sinking fund on the bonds floated for the project. Under such circumstances the adjustment would affect first cost as well as operation and maintenance.

The statement that the principal beneficiary of the waterway would be Canada is scarcely borne out by consideration of the statements contained in the report of the International Joint Commission with respect to the resources of foreign and coastwise trade of each country within the country economically tributary to the waterway. There are in the tributary area of the United States some forty-two millions of people, while in the tributary area of Canada there are less than five millions. The production which is indicative of the resources of the two tributary areas is far greater within the tributary area of the United States than in that of Canada. Under such circumstances it is only reasonable to expect that a larger share of the cost of navigation works should be assumed by the United States than by Canada.

PROFESSIONAL LEGISLATION IN ONTARIO

THROUGH the pronounced opposition of the interests in Northern Ontario, it has become necessary to make a modification in the Professional Engineers' Bill now before the Ontario Legislature. It was represented by these interests that the long existing privileges of the prospector and mining operator would be encroached upon and that the bill would be intolerable to them. Rather than court the opposition of a considerable number of engineers and technical workers in the mining industry, the Advisory Conference Committee has agreed to an amendment of the bill which will render it inapplicable to those conducting mining or metallurgical operations.

While this procedure is undoubtedly the best under the circumstances, it is to be hoped that in the near future mining men will come in under such professional engineers' legislation as may be passed. No doubt a considerable number of professional mining engineers will take advantage of the prestige offered in registration and will become members of the Association of Professional Engineers, although such will not now be obligatory. When it is discovered that the professional engineers have no sinister designs on the mining industry, and greater confidence has been created, there no doubt will be a thorough consolidation of all professional engineering interests in the Province and through it adequate legislation both in the interests of the public and of the engineers themselves will arise.

PERSONALS

LIEUT.-COL. CARMICHAEL, minister without portfolio, and representative of the Ontario Government on the Hydro-Electric Power Commission has placed his resignation as a commissioner in the hands of Premier Drury.

W. C. SMITH, of Toronto, has been recommended to the City Council by the Water and Light Commission for

appointment as town engineer of Oshawa, Ont. Mr. Smith was formerly engineer for the Sumas Reclamation Project, New Westminster, B.C. If appointed, Mr. Smith will supersede N. G. McDONALD, the present town engineer, and also N. J. GOEBEL, the waterworks engineer, as the Board of Works has recommended the amalgamation of these two offices.

THOMAS W. HARVIE, the chief engineer to the Montreal Harbor Commissioners, was born in the parish of Old Monkland, Lanarkshire, Scotland, on August 5, 1877. He was educated at Gartsherrie Academy, Garnet-hill School and the Royal Technical College, Glasgow, winning distinction in most of the classes at the last-named institution. Mr. Harvie was a pupil for five years with Kyle, Dennison & Frew, civil engineers, and remained with this firm one year longer as assistant engineer, during

which period he was engaged on water supply, sewage and general engineering work. The following three years he was assistant resident engineer with the Caledonian Railway on heavy railway construction contracts. During the subsequent six years Mr. Harvie was on the engineering staff of the Clyde Navigation and acted as resident engineer on harbor construction. Mr. Harvie's next position was with Sir Robt. McAlpine & Sons as agent and engineer on York-hill Docks and other works for a period of three years. In 1910 Mr. Harvie was appointed assistant engineer on the engineering staff of the Harbor Commissioners of Montreal, and for three years was resident engineer on the construction of the new Victoria pier and market basin, riverside wharves and upper section of the harbor railways. In 1913 he was appointed assistant chief engineer in succession to A. D. Swan and from that date was in charge, directly under the chief engineer, of the various schemes of harbor extension and improvements. When W. F. Cowie was promoted to the position of consulting engineer to the Harbor Commissioners in February, Mr. Harvie succeeded him in the office of chief engineer. Mr. Harvie has had over 25 years of experience in engineering works, nearly 20 of which have been entirely devoted to harbor construction. Mr. Harvie is a corporate member of the Institute of Civil Engineers, London, and also of the Engineering Institute of Canada. He is a member of the Association of Professional Engineers of the Province of Quebec, and a member of the American Association of Port Authorities.

OBITUARIES

JOSEPH HALL, for nearly 50 years superintendent of the waterworks system at Windsor, Ont., died at the Hotel Dieu on March 6. Born in England 83 years ago, Mr. Hall came to Canada when he was 14 years old.

J. R. McCAILLUM, chairman of the Welland Water Commission, died recently at his home in Welland aged 76. The deceased was at one time a prominent contractor.

E. B. MCKAY, a former surveyor-general of British Columbia died in Edinburgh, Scotland, recently, aged 72. Mr. McKay was born in Scotland and came to Canada in

1875, and joined the staff of the Vancouver Coal Co. In 1883 Mr. McKay left Nanaimo and engaged in survey work on the Island railway. In 1889-90 he was in charge of a party which surveyed the Sutton timber lands, and in the latter year he entered the Government service as draughtsman. He was appointed surveyor-general in December, 1905, and continued in that capacity until 1911, when he was superannuated. He surveyed and laid out the town of Duncan, B.C.

Engineer's Library

BAROMETRIC CONDENSERS. Bulletin No. 9224 issued by the Canadian Ingersoll-Rand Co., Sherbrooke, Que., gives a clear understanding of the principles underlying condensation with particular emphasis on the importance of proper construction of counter-current condensers. The bulletin contains a comprehensive description of the barometric condenser, dealing with the construction and method of operation while a number of illustrations show the details of construction and several installations. Copies of the bulletin may be obtained from the head office of the company or any of the branches.

OIL PRODUCTION METHODS. A study of oil-producing methods is being made by T. E. Swigart, who is preparing a bulletin that will deal with the advantages and disadvantages of the various kinds of equipment used on producing oil wells, with methods of handling wells that produce by flowing, bailing, swabbing, and pumping, and methods for overcoming the many troubles encountered in this work. A paper on surface equipment for pumping wells is being prepared by H. C. George, petroleum engineer at the San Francisco field office of the United States Bureau of Mines. This paper will cover the many problems of power and of methods of connecting wells in order to reduce pumping costs.

A complete photographic survey of the proposed Great Lakes-St. Lawrence river deep waterway, with special sets of vertical and oblique photographs of points along the route where the different engineers suggested dams and locks, has been completed by the Ottawa station of the Canadian Air Board for the International Joint Commission. Surveys were also carried out over the old and new Welland canals, showing the progress made with the project.

The report of the investigation made by the United States Bureau of Mines at the Pittsburgh Station, relating to the value of coke, anthracite and bituminous coal for the generation of steam in the low pressure cast iron boiler, is being prepared for publication at a later date. The report shows the relative steaming values of the fuels and why the thermal efficiency varies with the different fuels. The draft required with the various fuels is carefully analyzed.

An Eastern Ontario Good Roads Association, whose object is "to protect the interests of the eastern part of the Province" in road construction, has been formed at Kingston, Ont. It is the intention of the new association to call a convention in Kingston in the course of the next few months to formulate new road plans and discuss the possibility of the extension of the Provincial highway system in the East. The contention of the organizers is that Western Ontario has been unduly influencing the Government's policy, and that the East must be organized to look after its own interests. It is claimed that, in respect to mileage, the west has dominated the whole program. It is pointed out that there are about 1,200 miles of highway in that portion of the Province, compared to less than 600 miles in the east, and that the east has but a single trunk line in the highway from Toronto to Montreal and Ottawa.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders	
	Close	Issue
Hamilton, Ont., construction of storm sewer	Mar. 22	Mar. 7
Ottawa, Ont., plumbing, heating, wiring, tinsmithing, roofing, plastering and painting	Mar. 15	Mar. 7
Regina, Sask., erection of Chemistry Building	Mar. 31	Mar. 7
Toronto, Ont., erection of school	Mar. 18	Mar. 7
Winnipeg, Man., erection of High School	Mar. 20	Mar. 7
Essondale, B.C., erection of addition to hospital	Mar. 24	Feb. 28
Raleigh Tp., Ont., erection of a school....	Mar. 18	Feb. 28

BRIDGES, ROADS AND STREETS

Barton Tp., Ont.—The Township Council decided to macadamize Crockett St., from East 32nd St. to East 36th St. Sidewalk improvements will likely be made on south side of Concession St. Clerk, A. G. E. Bryant, Hamilton.

Brantford, Ont.—City Engineer F. P. Adams will submit a program of proposed road improvements to the City Council at its next meeting.

Brantford, Ont.—The Provincial Highway in Brant County, between Brantford and Paris, will be graded and surfaced with gravel this season. On the west side of the county for a distance of about one mile a waterbound macadam base course will be constructed.

Brantford, Ont.—An extensive road program has been approved by the department of A. M. Jackson, County Engineer, including the laying of about 2½ miles of 9-ft. pavement along the Burford Road. The Mount Pleasant Road is to be further graded next fall in preparation for concreting the following year. Filling will be continued on the Cockshutt Road; Burford Road will be gravelled in that area directly under the county jurisdiction; grading will be carried out near Oakland for a distance of some two miles; and general road work on the Burford, Norwich and Hatchely roadways will be undertaken. The road through the village of St. George will also be rebuilt, and two miles more grading carried out at the end of the Blossom Road.

Calgary, Alta.—The City Commissioners are considering the widening of Seventeenth Ave. West.

Calph, Ont.—The City Council passed a by-law providing for the raising of \$62,431.10 for the construction of pavements. City Engineer, F. McArthur.

Hamilton, Ont.—The Works Committee will have sidewalks completed on Tragina Ave. and Weir St.

Hamilton, Ont.—The Board of Works is considering the widening of York St. near the high level bridge, and the extension of Glenferrie Ave.

Hamilton, Ont.—The paving of King St., from James St. to Bay St., and Wentworth, Locke and Margaret Streets is planned. City Engineer, E. R. Gray.

Hamilton, Ont.—The opening up of the mountain roadway, from Sherman Ave. east to Ottawa St., has been suggested as a means of providing more employment.

Hamilton, Ont.—Wentworth County Council will spend \$60,000 on the construction of roadways on the main thoroughfares of Beamsville and Grimsby. Road Superintendent, T. R. Allison, Hamilton.

Hamilton, Ont.—The "jack knife" bridge at the Hamilton Beach canal is nearly completed and will be opened about March 25, when automobile traffic across the beach, which has been cut off for over a year, will be resumed.

Hamilton, Ont.—The Works Committee decided to pave Mary and Catharine Streets, from Cannon to Barton Streets. The paving of Dundurn St., from York to King Streets, is under consideration. City Engineer, E. R. Gray.

Hull, Que.—A resolution calling upon the Quebec Provincial Highways Department to designate the road from Hull to Maniwaki as a provincial highway was adopted by Ottawa County Council.

Kitchener, Ont.—The City Council instructed Stanley Shupe, City Engineer, to obtain quotations on a carload of cement.

Kitchener, Ont.—The City Council decided to complete Woodlands Ave. grading. A sidewalk will be constructed on the south side of Baurice St., between South and Sidney Streets. City Engineer, S. Shupe.

Manville, Alta.—The council of the Municipal district of Melberta No. 483 will urge the Government to construct a bridge across the Vermilion River. If the Government builds a bridge, the municipality will build a road.

Penticton B. C.—According to Provincial Road Engineer W. K. Gwyer, an extensive road program is to be carried out in this district during the coming season, necessitating the employment of more than 1,000 men. Among the most important work is the construction of 35 miles of trans-continental road from Hope to Princeton. Tenders for the work will be called shortly. The 19 mile gap in the trans-provincial highway between Christina lake and Rossland will be finished this year. Most of the other work will consist of improvements to existing roads, particularly along the Okanagan lake shore and on the Oliver project road, which will probably be extended to Osoyoos.

St. Catharines, Ont.—The Dominion Railway Board has ordered the Grand Trunk Railway to have completed by June 30, this year, a new overhead bridge on St. Paul St. West.

Simcoe, Ont.—The Provincial Highway Department plans to undertake the following work in Norfolk County: West from Simcoe 12 miles of road will be graded and gravelled; an additional 8 miles will be gravelled, making a total of 20 miles west from Simcoe which will receive a substantial surfacing of gravel. In the town of Simcoe a bridge with a 40-ft. span will be constructed. All the culverts between Tillsonburg and Jarvis will be, it is expected, placed under contract within the next few weeks. The three miles of Provincial highway at the end of the county will be surfaced.

Toronto, Ont.—The City Council referred back to the Works Committee the proposed extension of Riverdale Ave.

Toronto, Ont.—The City Council passed the necessary by-laws for the extension of Dundas St. across Yonge St.

Toronto, Ont.—The Works Committee recommended the extension and grading of Patterson Ave., at a cost of \$15,500.

Toronto, Ont.—The City Council decided to call for tenders for the construction of bitulithic pavement on Coleman Ave.

Toronto, Ont.—The City Council rejected the proposed widening of Bloor St., from Sherbourne St. to Spadina Ave.

Toronto, Ont.—The City Council intends to construct an asphalt pavement on Chestnut Park, at an estimated cost of \$49,989.

Toronto, Ont.—The Board of Control recommended that tenders be called for the construction of an asphalt pavement on Coleman Ave.

Toronto, Ont.—The Works Committee recommended the adoption of the report of Commissioner Harris for the opening of a lane 12 ft. wide, between Keele St. and Mavety St., at a cost of \$2,475.

Toronto, Ont.—Mayor Maguire announced that if the railway companies will build their proposed bridge over the tracks at the foot of Spadina Ave., the city will not have any objection to their doing so. This statement was made in reference to the application made some time ago by the railway companies to the Dominion Railway Commission, but held in abeyance. The Mayor has received a plan of such a bridge.

Toronto, Ont.—The chief engineers of the C.P.R. and G.T.R. recently held a conference with Mayor Maguire and Works Commissioner Harris on the question of eliminating the level crossing on Bloor St., between Dundas St. and Lansdowne Ave. Mr. Harris has prepared plans for a subway under the east tracks and a bridge over the west. These are to be considered by the railways, and the city will be further advised as to whether they will consent to the plan. The matter will then be submitted to the Railway Board for a division of the costs.

Toronto, Ont.—The Works Committee recommended the adoption of the reports of Works Commissioner Harris for the construction of the following work: Raglan Ave., concrete walk on east side, \$614; Fairford Ave., Morley Ave. to Coxwell Ave., asphalt pavement, \$24,316; Maughan Crescent and Hemlock Ave., Edgewood Ave. to Robbins Ave., asphalt pavement, \$16,589; Wabash Ave., Sorauron Ave. to east end, asphalt pavement, \$36,197; St. Clair Ave., concrete pavement, \$35,348; curbs on Fairford Ave., Hemlock Ave. and Maughan Crescent, \$3,366; concrete sidewalks on Gifford St., Glendonwyne Road, Nasmith St., Glebeholme Blvd., and Ashdale Ave., \$15,132.

Victoria, B. C.—The following tenders were opened recently for the construction of the steel railway portion of the Johnston St. bridge: Canadian Bridge Co., Ltd., Walkerville, Ont., for supplying the steel and preparing it for assembly, \$159,900, and for completing the structure, \$213,400; John Coughlan & Sons, Vancouver, agree to do the same for \$175,000 and \$212,500, respectively. William Arrol Co., Ltd., Glasgow, Scotland, \$186,156 for the supply and fabrication of the material. The tenders were referred to the public works committee.

Windsor, Ont.—This city's share of the cost of paving 14 miles of county and provincial highways in the Windsor suburban area, which extends to Essex, is approximately \$150,000. It is proposed to ask the Provincial Government to complete this work in two years.

WATER, SEWAGE AND REFUSE

Guelph, Ont.—At a recent session of the Dominion Railway Board held here a new plan for the proposed Grand Trunk freight sheds was presented by E. A. James, consulting engineer, Toronto, who was employed by the city to prepare same.

Oliver, B. C.—It is expected that the government expenditure on the large irrigation project here this year will be approximately \$400,000.

Oshawa, Ont.—The Grand Trunk Railway Co. will immediately erect a 75,000-gallon water tank here.

Ottawa, Ont.—The City Council authorized the Board of Control to call for tenders for the construction of the Emmett St. sewer.

Ottawa, Ont.—The City Council awarded the following

contracts in connection with the Overland Pipe Extension: For special pipe castings, Victoria Foundry Co., Ottawa, at \$6.18 per cwt.; expansion joints, Canadian Des Moines Steel Co., Ltd., Chatham, Ont., one expansion joint, \$281, and four expansion joints at \$319 each.

Quebec, Que.—Power has been given to the Quebec Streams Commission to build a gigantic dam on the Ouareba River in the Laurentian Mountains, beyond St. Agathe, at a cost of \$250,000. The work is to be started this spring, and will include the erection of storage dams at Lakes Ouareba, Archambault and Blanc.

Toronto, Ont.—The Works Committee recommended the adoption of the report of Commissioner Harris for the construction of a 6-in. water main on Nursewood Road at a cost of \$2,775.

Toronto, Ont.—The Works Committee recommended the adoption of the reports of Commissioner R. C. Harris for the construction of sewers on Small St. and Simpson Ave., to cost \$1,770 and \$4,200 respectively.

Toronto, Ont.—The contract for the laying and jointing of water pipes on Larchmount Ave., Berkshire Ave., Rushbrooke Ave., Marigold Ave., and Eastern Ave. has been awarded to the Grant Contracting Co., Ltd., Toronto.

Vanconver, B.C.—City Engineer Fellowes' has recommended the laying of another 18-in. pipe across the First Narrows, at a cost of \$33,000.

Vanconver, B.C.—The contract for supplying the city with 2,200 ft. of water pipe, at \$2.88 a foot, has been awarded by the City Council to the Vulcan Iron Works.

Windsor, Ont.—Engineer Keith of Essex Utilities Commission is preparing data which is expected to show that the commission will be able to supply filtered water to the border municipalities at lower rates than the Walkerville Water Company. Officials of the commission are certain that a joint filtration system will be more economical than individual units at Walkerville and Windsor. Under the plan of the commission all the municipalities will control the distribution systems.

York Tp., Ont.—The Township Council instructed Engineer R. O. Wynne-Roberts to prepare plans of the proposed sewerage lines for the suburban areas of the township.

York Tp., Ont.—The Township Council will have permanent culverts constructed on Nairn Ave., Ennerdale Road, Holmesdale Road, Harvey Ave., Blackthorn Ave., and First Ave. Engineer, Frank Barber, Toronto.

LIGHT, HEAT AND POWER

Barton Tp., Ont.—The Township Council passed a resolution asking the Hydro-Electric Power Commission of Ontario to incorporate that section of Barton Township which is situated below the mountain with the Saltfleet rural distribution system. Also that the commission be asked to prepare a statement on the cost of segregating the Barton township distribution system.

Bridgeburg, Ont.—The Town Council appointed a committee consisting of Mayor W. T. Malkin and Councillors Williams, Atwood and Hogg, to take up the question with the Hydro-Electric Power Commission of Ontario of bringing the Hydro into Bridgeburg. The Commission will start the construction of a line from Chippawa to Stevensville shortly and Bridgeburg will almost be touched by this line.

Kingston, Ont.—The Utilities Commission will proceed at once with the changing of the power lines on Ontario St. About 25 steel poles will be erected.

London, Ont.—The improvement of the city's street lighting is projected. It is understood that \$60,000 or \$75,000 will be available for this purpose.

Montreal, Que.—It is believed that the Montreal Public Service Corporation contemplate developing power on the Kipawa river in Pontiac County where 90,000 h.p. can be generated. This corporation is seeking powers to

construct transmission lines in twenty-three counties in this province.

Penticton, B.C.—The Municipal Council will have work commenced shortly on the installation of an electric pumping plant. Estimated cost, \$12,000. Clerk, B. C. Bracewell.

RAILWAYS

Calgary, Alta.—The street railway department has applied to the city commissioners for authority to call for tenders for 35 tons of steel rails, to be used on Centre St.; an electric welding outfit; and a Ford truck to be used as a tower for work on the overhead lines.

Galt, Ont.—The Public School Board decided to erect an 8-room school. Chairman, C. K. Jansen.

Hastings, Ont.—John Coughlin has offered the School Boards a free site for the erection of a public or High School.

London, Ont.—Several thousand dollars will be spent for repair work throughout the London division of the G.T.R., and work will commence shortly. The Grand Trunk will continue laying new 100-pound steel rails between London and Sarnia.

Montreal, Que.—The Knights of Columbus are inaugurating a campaign to raise \$250,000 for the erection of a clubhouse.

New Toronto, Ont.—A by-law will be submitted to authorize an issue of debentures amounting to \$75,000 for the erection of the proposed new school.

St. Catharines, Ont.—Mayor Graves is pressing for some action here to get under way the proposed extensions and improvements on the local street railway and on the suburban lines of the N. S. and T. Railway. Alderman J. E. Riffer, chairman of the Railway Committee, has called a conference of all the municipalities, and will submit the assurance from Sir Adam Beck that there is no reason why extensions and improvements cannot be carried out by the present owners and the cost added to the option price. Pressure will be brought to bear to have some action taken at once.

Swastika, Ont.—The Canadian Light Railway Construction Co. has asked the Ontario Government for support in the construction of a light railway through the outlying mining fields of this district. It is planned to build standard gauge lines.

Toronto, Ont.—This year's rehabilitation program of the Toronto Transportation Commission calls for an expenditure of approximately \$11,000,000.

Toronto, Ont.—The Separate School Board will erect schools in Moore Park, an 8-room school on Jane St., a 10 room school in the vicinity of Ossington Ave. and Dewson St., and a 1-room school in the neighborhood of Dundas and Bloor Streets. Also a 4-room school in Fairbank district. Chairman, David Carey.

Toronto, Ont.—Ward Two Ratepayers' Association will ask the Toronto Transportation Commission to extend the street car tracks up Parliament to Bloor St. The Association will also urge upon the commission the need of establishing a cross-town car service, by way of Danforth Ave., Bloor St., Parliament St. and Queen St. to Sunnyside.

Waterloo, Ont.—Plans for the erection of a parish hall for St. John's Lutheran Church will be completed shortly. Estimated cost, \$40,000. Address Joseph Ludwig.

FACTORIES AND LARGE BUILDINGS

Beeton, Ont.—The School Board awarded the contract for the erection of a school to E. H. Horton, of Hamilton.

Berwick, N.S.—W. O. Bilgic intends to erect a two-storey theatre 90 by 40 ft., on Commercial St.

Brechin, Ont.—Plans are being prepared for the early commencement of work on the new High School for the Scarborough district, to be erected at Scarborough Junction.

Bridgeburg, Ont.—An Anglican parish hall will be erected at the corner of Central and Emerick Avenues.

Calgary, Alta.—The School Board will submit by-laws to raise \$60,000 to remodel certain schools.

Calgary, Alta.—The congregation of the Central Christian Church plan the erection of a three-storey edifice at the corner of Fifteenth Ave. and Sixth St. West. Pastor, Rev. Burton Davies. Tenders will be called. The congregation has in view the construction of a third unit to be used as the church auditorium in the not distant future.

Edmonton, Alta.—The Board of Education is considering the provision of additional school accommodation.

Edmonton, Alta.—Sketch plans of the proposed new Isolation Hospital have been prepared by City Architect J. Martland. Estimated cost, \$200,000.

Ettobicoke Tp., Ont.—Walker & Gibson, architects and engineers, 70 Victoria St., Toronto, have been retained by the Trustee Board of School Section No. 11, to design and supervise the construction of a six-room addition to the present school building. The old building is to be overhauled and made more fire proof.

Ford City, Ont.—School Board plans the erection of a school on Charlotte St. at a cost of \$100,000. Tenders will be called. Architect, A. H. McPhail. The erection of a school in the Drouillard Road district is under consideration.

Galt, Ont.—The School Board is having plans prepared for an eight-room school and tenders will be called.

Galt, Ont.—High School Inspector Rogers has recommended the erection of an addition to the Collegiate Institute.

Guelph, Ont.—A special committee has approved plans submitted by Architect George Hutton, of Hamilton, and decided to call for tenders for the new Collegiate Institute, which will cost approximately \$320,000.

Hampton, N.B.—The grist mill owned by W. H. Hill was destroyed by fire recently. Loss, \$14,000.

Kingston, Ont.—Plans are being prepared by Stevens & Lee, architects, for the proposed infectious building in connection with the General Hospital.

Kingston, Ont.—Ettobicoke Township Council authorized the issuing of debentures amounting to \$90,000 for the construction of a school at Humber Bay.

Jarvis, Alta.—The local branch of the U.F.A. plans the erection of a hall. Secretary-Treasurer, H. H. Lee.

Kingston, Ont.—There appears to be every possibility that the Eastern Ontario Dairy School, recently destroyed by fire, will be rebuilt in this city. A scheme is now before the Government, and it is expected that a decision will be made shortly.

Kitchener, Ont.—The Dominion Shirt Co. plan the erection of a new factory.

Kitchener, Ont.—The Greb Shoe Co. plans the erection of an addition to their premises.

Kitchener, Ont.—The contract for the construction of St. Peter's Parish Hall has been let to Durker Bros., of this city.

Mimico, Ont.—A \$90,000 public school building is to be erected in the township, east of the Mimico municipal boundary.

Mimico, Ont.—The Official Board of Mimico Methodist Church decided to erect at the corner of Station Road and Mimico Ave. a church school building. Pastor, Rev. J. O. Johnson.

Montreal, Que.—Power to borrow several million dollars to build a new City Hall here will be granted by the Provincial Legislature.

New Toronto, Ont.—Charles Langley, chairman of the finance and management committees of the New Toronto Public School Board, announced that the trustees are proceeding with the project of building an eight-room public school. Estimated cost, \$75,000.

Niagara Falls, Ont.—The Brant Creameries will erect a two-storey brick, concrete and steel building on Simcoe St.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Power Development at High Falls, Que.

Possibilities for Power Development on Lievre River — Will Open Up Region Rich in Minerals for Industries — Two Falls Near Buckingham, Que., Supply Power for Electric Reduction Co. and McLaren Lumber Co.

BY A. LANGLOIS

WITH THE great water powers at High Falls, near Buckingham and all along the river from Buckingham to its mouth, adding the 25 miles of inland navigation, the Lievre River Valley should become a most prosperous section of the Province of Quebec.

Besides its water powers, the region possesses almost unlimited forests together with fertile plateaux surrounded by mountains of graphite, mica and phosphate deposits. Only a fraction of the power possible of exploitation on the river has as yet been utilized.

River Drains Large Area

The Lievre River which takes its source about 225 miles to the north, flows into the Ottawa River at a point 18 miles east of Ottawa city. The total drainage area of the river is 4,050 sq. miles. Its average annual flow is about 3,000 c.f.s., but this could possibly be increased with proper conservation of the water from the lakes and tributaries. The extreme fluctuations of the river are low.

About 30 miles from its mouth, the river begins a series of falls and rapids of great importance. The first called the High Falls, is situated about 40 miles from Ottawa. In 1913 a dam was built at High Falls by the McLaren Lumber Co. of Buckingham. The dam is of modern type built of concrete throughout. It measures 600 ft. in length and averages 35 ft. in height, and is composed of nine piers and abutments. The dam is provided with three regulating sluices and a concrete log slide measuring 650 ft. in length. The head at the dam is 150

ft. This great water power readily available is near several towns but has not been developed.

From High Falls the Lievre River is navigable as far as the town of Buckingham, a distance of 25 miles. A lock is necessary, however, at Poupore, half way down.

DAM AT HIGH FALLS DURING CONSTRUCTION

to overcome a fall of 8 ft. This lock and the necessary dam and approaches were built by the Department of Public Works in 1892, but were considerably improved lately. The lock is built of masonry, and measures 150 ft. long by 31 ft. wide by 8 ft. on the sills. The minimum depth of the channel is 9 ft.

Development at Buckingham

A Buckingham there are two magnificent concentrated falls which are at present being developed to full capacity. The two falls are only a short distance apart. The power developed on the upper falls is utilized by the Electric Reduction Co., excepting a small reserve to the town of Buckingham water works.

The Electric Reduction works are situated on the site of an old granted property and water power, where many years ago it was proposed to build a pulp mill, but which was bought by W. A. Williams, of England who, in company with the late W. F. Gibbs, a chemist and inventor, made a number of experiments on the possibilities of utilizing the enormous phosphate deposits of the Lievre River Valley, with the intention of erecting there, mills for the reduction of the ore. Mr. Gibbs was entirely successful

DAM AT BUCKINGHAM DURING CONSTRUCTION

in his experiments, at the same time discovering the means of using electricity for the reduction of the mineral in electric furnaces. Extensive developments have taken place since, and the company is today splendidly

COMPLETED DAM AND POWER HOUSE OF ELECTRICAL REDUCTION CO., BUCKINGHAM, QUE.

organized to extract the phosphate from the inexhaustible deposits in this region.

Electric Reduction Co. Development

The dam and power house of the Electric Reduction Company were built in the years of 1918-19. The works there, as well as those at High Falls, were constructed under the supervision of John B. McRae, consulting engineer of Ottawa. The dam is built of reinforced concrete throughout. It comprises a log slide, five sluiceways controlled by stop logs, and a long spillway adjacent to the power house which is also entirely built of reinforced concrete. Three units are in operation at the present time, and provision has been made for two more to be used when the company has completed its proposed improvements to the mills, when it will then absorb all the power possible of development there. The head at the dam is 32 ft.

There is another concentrated fall at a few hundred feet down the river, the property of the McLaren Lumber Co. There, also, the extensive developments are under way, and it is said that the cost of the present improvements will be in the neighborhood of one and a half million dollars. The level at which it is proposed to maintain the water surface at the dam, will give an approximate head of 60 ft. The company operates two large saw mills, and a pulp mill having a capacity of 100 tons of pulp a day.

From the foot of the lower fall at Buckingham to the mouth of the Lievre River, there remains a total drop of 200 ft. distributed over a distance of about 2 miles and terminating by a concentrated fall of about 40 ft., situated at the intersection of the river with the Canadian Pacific Railway main line, the banks of the river at that point contributing to the development of the falls which are also divided in two branches, separated by a rocky island. These last mentioned falls are only 18 miles east of Ottawa city.

IRRIGATION STRUCTURES DISCUSSED

AN INTERESTING paper on "Actuarial Factors in the Design of Irrigation Structures" written by H. B. Muckleston of the Lethbridge Northern project was read by G. P. F. Boese, assistant engineer of the C.P.R. Natural Resources Department, before the Calgary branch of the Engineering Institute of Canada at the Board of Trade rooms, Calgary.

The economic problem in the design of water storage works is usually studied under five heads, as follows:

Determining the economic value of storage.

Determining the available storage from the run-off records over a series of years.

Determining the capacity curve for a wide range of dam heights.

Determining the unit of curve for a wide range of capacities.

Determining the economic storage capacity to be developed.

The reader then dealt conclusively with each of the above factors, giving a wealth of data and figures, gleaned by the experience taken from scores of irrigation projects, during the history of this phase of artificial water supply.

Possible floods to be provided against is the most important question entering into the consideration of the spillway. Given enough time, any size of flood may occur on any size of stream.

The various causes of high water in these latitudes are six in number: (a) a heavy winter snowfall in the mountains; (b) a late quick spring; (c) heavy rain in the water-shed; (d) precipitation on previously saturated catchment areas; (e) precipitation in which the storm centre moves down stream; (f) breaking of logs and ice jams, beaver dams, etc.; and (g) destruction of other storage works higher up in the valley. Any combination of these causes may occur together, resulting in anything from slight damage to disaster, or any one of them may cause high water or perhaps moderate floods.

He then gave a table showing how frequently each of the above causes, except the two latter, is operative on the average.

Cost Not Constant

The cost of maintenance is not constant, but will vary somewhat with the height, length of spillway, area of surface protected by rip-rap, or other means, and with other factors of more or less special application. Every irrigation canal, in the upper reaches at least, crosses the country drainage. This drainage must be taken care of either by taking it into the canal or passing it across.

The reader then went exhaustively into the figures giving the financial aspects of the structure. Absolute permanence is not a possibility, even the eternal hills decay. What is usually meant by permanence is a useful life so long that the annual charge to replacement account is practically zero. Even this kind of permanence is not always economical; for it may cost more than it is worth. But there is for each individual case a useful life which in the long run is the most economical.

Takes Extreme Case

It is frequently possible, by refinements in design, to save a considerable annual amount in the cost of operation; and as an extreme case he took a system where all the distribution is by means of closed channels. In this case, provided the pipes could stand the pressure, there would be very little cost properly chargeable to delivery of water, as each used would open and close his outlet at his own convenience. Such a happy state is however, seldom practicable.

In conclusion Mr. Boese said: "The best design in irrigation structures it not necessarily the cheapest in first cost of operation, but the design is as dependent upon the financial foundation as it is on its structural foundation."

At a meeting of the Hamilton branch of the Engineering Institute of Canada recently, a paper was read by F. W. Farmer, of the engineering staff of the Ontario Hydro-Electric Power Commission, on the electrical power plant at Queenston.

A most interesting and instructive lecture was delivered before the Engineering Society of the University of New Brunswick, at Fredericton, N.B., on March 9, by F. P. Vaughan of the Vaughan Electric Co., St. John, on the phenomena of high frequency currents. Mr. Vaughan demonstrated the effects and discharges by means of a number of pieces of valuable high frequency experimental and test apparatus which he recently donated to the science department of the University and valued at approximately \$2,000. With the addition of this apparatus to the equipment of the science department, wide fields of research work have been opened up to the students in the electrical course which is offered at the University.

INTERCEPTING SEWER IN THE ESSEX BORDER DISTRICT*

Sewer Serves Seven Municipalities Along Detroit River — Description of East and South Interceptors, and Pumping Stations — River Freed from Pollution

M. E. Brian, O.L.S.; A.M.E.I.C.
City Engineer, Windsor, Ont.

BORDERING on the Detroit River in the Province of Ontario there are seven incorporated municipalities — Tecumseh, Riverside, Ford, Walkerville, Windsor, Sandwich and Ojibway — with adjoining boundaries along the river for ten miles. The entire district is very flat and the drainage of each municipality in relation to its downstream neighbor, created a distinct problem which could not be solved without joint action between them.

In 1914 the International Joint Commission issued their first progress report and in it, the fact was stated that the entire Detroit River was polluted by the municipalities of Windsor, Walkerville and Sandwich, and across the International Boundary, in the State of Michigan by the cities of Detroit, Wyandotte and Trenton. It further stated that the intakes of the Windsor and Walkerville waterworks systems, were exposed to pollution owing to the discharge of sewage above them.

In 1916 a second report was published dealing with the prevention or remedy of this pollution. It advocated the formation of a drainage district along the Detroit River in order to avoid friction and duplication of effort which would result by each municipality endeavoring to solve its own problems.

Essex Border Utilities Commission Formed

In 1916, the Essex Border Utilities Commission was constituted by special act of the Legislature at the request of several of the municipalities along the Essex Border, which had common problems that could not be satisfactorily settled by the municipalities individually. The Commission had for its object, the solution of problems which affected the entire district as distinct from those affecting any one in particular. The personnel of the Commission included the Mayor and one elected representative from each of the municipalities in the Metropolitan District.

To consider the various problems, the engineers of the district constituted a board, consisting of the late Owen McKay, representing Ford City and Walkerville; M. E. Brian, representing Windsor; C. R. McColl, representing Sandwich Town; J. J. Newman, representing Sandwich West Township, and Morris Knowles, C.E., representing Ojibway. The writer, city engineer of Windsor, was appointed chairman. The Board recommended that an engineer be retained by the Commission to make a report on a metropolitan water supply and sewage system, and as a result, the Commission appointed Morris Knowles, C.E., of Pittsburg, Pa.

Report Recommendations

A single joint sewage scheme to protect the entire water front was proposed as being most economical, both in first cost and operating charges. In brief, the report recommended an intercepting sewer parallel to the river front, extending from Pellette Road in Ford to 14th Street in Ojibway, with a disposal plant in Sandwich between Chewett and Detroit Streets. As an economic factor, the plant was designed for domestic sewage only, with storm overflows into the river, as all sewage would require to be

pumped on reaching the disposal plant. Two recommendations were incorporated in this report for immediate consideration.

(1) That the sewage of Ford and Walkerville be collected at once in an intercepting sewer and be delivered to a pumping station in Walkerville and there lifted to an intercepting sewer connecting with the Parent Avenue outlet, thus removing all sewage from the river above the present intakes.

(2) That an intercepting sewer be constructed through portions of Ojibway, Sandwich West, and Sandwich, which would deliver the sanitary sewage from these districts into an existing outlet on Park Street in the Town of Sandwich.

In March, 1918, the work embraced in the foregoing recommendations, was approved by the electors of all municipalities by a vote of seven to one.

Cost Apportioned Among Municipalities

The estimated cost of the work, based on labor and material prices in 1916, was \$210,300. The cost was apportioned among the various municipalities upon the basis of four factors, area, population, capacity and capacity times distance, with some minor modifications to govern special conditions and was as follows: Ford, \$65,300.00; Walkerville, \$18,600.00; Windsor, \$26,200.00; Sandwich, \$25,333.34; Sandwich West, \$28,333.33; Ojibway, \$46,533.33; Total, \$210,300.00. The estimated costs were considerably exceeded as the work was carried out in 1918-19-20, when labor and material were at the highest level.

The work divided itself naturally into two sections,

easterly and southerly, and while in progress was referred to as the east and south interceptors. Detailed surface and underground surveys of Sandwich Street, from Pellette Road in Ford, to Parent Avenue in Windsor, were made by the late Owen McKay, while similar surveys were made for the south interceptor by Messrs. McColl and Fletcher.

The quantities of vitrified tile sewer involved in the east interceptor, were as follows: 942 lin. ft. 15 in.; 1469 lin. ft. 18 in.; 1555 lin. ft. 20 in.; 2585 lin. ft. 24 in. The quantity of segment block sewer used was 2037 lin. ft. 30 in. and 3709 lin. ft. 33 in. There were 48 manholes in addition to measuring chambers and regulators.

Regulators at Junction of Two Sewers

The existing outlet sewer and drains in Walkerville and Ford, carried both storm water and sanitary sewage. To divert the dry weather sanitary sewage into the interceptor and allow the storm water to continue into the river, regulators were designed and built at the junction of the two sewers. The regulators consist of two compartments built adjacent to the combined sewer, one directly connected with it, containing a float which rises and falls with the flow in the combined sewer, the other section connected by means of an 8 in. x 12 in. opening with a cast iron bronze faced sliding

*Paper read at the Thirtieth Annual Meeting of the Association of Ontario Land Surveyors, Toronto, Feb. 21-23.

gate. This gate is connected to the float through lever rods so arranged that the sanitary sewage is at all times diverted into the interceptor. During a storm, the float rises, which in turn partially closes the slide gate, allowing a diverted flow, equal to the maximum sanitary flow from the drainage area, into the interceptor. The lever and float are so arranged that they may be adjusted to meet the increased discharge of the growing district. A dam of sufficient height is constructed in the combined sewer to divert the sanitary flow to the interceptor. These have now been in operation for almost two years and have been found positive in action at all times. In Walkerville, it was necessary to install a tide gate in one of these structures, otherwise the Detroit River at its maximum recorded elevation, would flow into the interceptor.

While several factors were involved in the apportionment of construction costs, the maintenance charges are in direct proportion to the amount of sewage delivered by each municipality. To this end measuring chambers were erected at the municipal boundaries. Measurement is made in each case by a Venturi meter connected to an indicating and recording register, from which daily charts are obtained. By simple subtraction, the amount of sewage from each municipality can be ascertained.

East Sewage Interceptor

To complete and put into operation, the east sewage interceptor, a pumping station, was necessary near the boundary between Windsor and Walkerville. This avoided a high lift for all the sewage at the disposal plant and eliminated excessive depth of sewers across the city of Windsor. The east interceptor was designed of sufficient capacity to carry the sewage flow from Ford and Walkerville, when both municipalities would be completely built up. The pumping equipment for this station must, therefore, be capable of lifting this flow and after being selected, the station was designed to accommodate it.

The station is 24 ft. in diameter and 22 ft. deep, constructed throughout of reinforced concrete. The lower compartment contains the pumps, while the motors, float, switches, meter registers, etc., are located on the upper floors. An annular wet well is provided around the pump room to distribute the sewage from the interceptor to any one or more of the pumps. The upper part of the wet well is enclosed to form a force main and receive the discharge from the pumps placed three feet below the interceptor to make them self priming.

Four complete pumping units will ultimately be installed, two being in place at the present time; one of which serves as a spare except in short period of maximum daily flow. Each unit consists of one 2000 i.g.m. vertical centrifugal Yeomans sewage pump, direct connected to a 20 h.p. 3 phase 25 cycle 220 volt. 500 r.p.m. induction motor. The station is automatic in operation, the motors being started or stopped by a float operated switch attached to a copper float, actuated by the rise and fall of sewage in the wet well. The station is entirely underground, access being available through a small brick superstructure of pleasing appearance. It has been in operation for almost two years and during that time all sewage from the towns of Ford and Walkerville, has been discharged below the intakes of the Windsor and Walkerville waterworks.

South Sewage Interceptor

The south Interceptor extends from 14th St. in Ojibway follows Main, Sandwich and Russell Streets to Park Street and is 12,930 ft. long. It was designed to care for the domestic flow from Ojibway, Sandwich West and the southerly half of Sandwich. The sewage of Ojibway will be received at a pumping station to be constructed near 13th Street by the city of Ojibway, and will be raised and delivered to the interceptor at this point. There were no existing sewers in the district traversed by this portion of the interceptor and special structures of any kind were unnecessary. Lock joint pipe was used, and in the following

quantities: 5690 lin. ft. of 27 in.; 4370 lin. ft. of 39 in. and 2800 lin. ft. of 42 in. There are 27 manholes.

This work presented many construction difficulties, the greater part of it being through water bearing sand. Sheet steel piling was used for a short time but was abandoned and the trench opened with a clam shell bucket, until the sides stopped sliding, the trench in places being 25 ft. wide. While the yardage excavated was excessive, more rapid progress was made and at less cost than by driving and pulling the steel piling.

A temporary pumping station was constructed at Park Street to lift the sewage into an existing sewer. This will be of no further use when the interceptor is continued to the proposed disposal plant.

With the completion of these two sections of sewer, and the auxiliary structures, the recommendations contained in the engineer's report had been acted upon, nine sewage outlets had been eliminated and the river front freed from domestic pollution, for a length of five miles. The time is probably not far distant when the International Joint Commission will issue an order that the pollution of Boundary waters must cease. With the completion of the section across the city of Windsor and part of the town of Sandwich, and the construction of the disposal plant, the order will have been complied with in so far as it concerns the Essex Border District. In conclusion the writer desires to record his indebtedness to J. C. Keith, now chief engineer of the Essex Border Utilities Commission, for facts and plans.

IMPROVED STEEL COLUMN FOOTING

UNTIL recently the accepted method of constructing a spread footing for a steel frame building has been by the use of steel grillages. An important departure from, and improvement on, this practice has, however, been made by Eugene W. Stern, consulting engineer, New York, and a graduate of the University of Toronto. This consists of utilizing layers of rolled steel slabs, laid one on top of the other with their contact surfaces planed. Footings of this type have been used by Mr. Stern for some time with marked success and economy.

For light loads, single steel slabs have been used by many designers, but the replacing of heavy footings by a tier of slabs is believed to be novel. This construction not

COLUMN FOOTING

only is cheaper than grillage construction, but it takes up much less depth—an important consideration where rock excavation is necessary. Slab footings are also much cheaper and more dependable than steel castings.

In design, Mr. Stern believes that for an unyielding foundation, the cantilever method is perfectly safe, assuming a permissible flexural stress of 16,000 lb. per sq. in.

The accompanying illustration shows a footing 82 in. square supporting a column with a load of 3,400 tons and transmitting this load to a hard rock foundation. If this footing were properly built up of grillage beams, its cost would be almost double that for the design shown.

The Montreal Water Board now consists of Ald. Brodeur, chairman, S. Fortin and H. A. Turreault. The services of Messrs. R. S. & W. S. Lea and Walter J. Francis have been retained as consulting engineers to the Board.

THE MONTREAL SITUATION WITH REFERENCE TO TOWN PLANNING*

Rapid Growth of City and Lack of Definite Plan — Traffic Congestion — Need for Comprehensive Plan — Should Co-operate With Railways

By James Ewing, M.E.I.C.

IN THE last thirty years the city of Montreal has grown fully five times over, or twice as fast as the Dominion of Canada itself. This astonishing development has been due, as most students of civic development will admit, much more to individual enterprise than to good guidance or good government. The basic reason for the rise of Montreal is the unique situation of the city itself, on one of the world's greatest waterways, at the head of ocean navigation, and yet hundreds of miles inland. It has thus become the main transfer point of all railroad and water borne traffic, inward and outward bound, of the larger part of a continent, and to this must be added its great natural advantage of abundance of water power, both present and potential, and its by no means to be lightly estimated steady and reliable labor market.

There is little to fear that the future growth of the city will be arrested or even in any degree lessened. Montreal will continue to grow, and it is this that brings us face to face with the question as to the manner of its growth.

Montreal was never designed for a really great city. It has simply happened along. If we consider it in its beginnings as an early settlement with rather narrow streets, we shall observe this little centre fringed around a series of long narrow strips of land, and we shall learn to appreciate the wisdom of the early French settlers who held the secret of sociable and neighborly farming, which is at the bottom of the successful agricultural development of the province of Quebec, and which is in striking contrast to the rule-of-thumb rectangular and sectional methods of the other more westerly provinces.

But the intrepid pioneers of these early days were not prophets, and who can blame them if they failed to foresee the wonderful destiny of the mighty city which, during the last two centuries, has sprung up on the banks of the St. Lawrence River under the shadow of Mount Royal?

But unfortunately for us, what is good for agricultural development is not so favorable for the convenient and orderly disposition of a great city. For the multiplicity of ownership entailed by these long narrow strips requires a strong and intelligent guiding and controlling hand in the laying out of streets, and that is what Montreal has never had, what she most needs, and what if she continues to do without will only bring her into more and deeper trouble.

Already Montreal is becoming cumbersome and unwieldy, her shoes are beginning to pinch, and she is, to use a colloquialism, "treading on her own feet." It is not to be expected that free, healthy and vigorous movement can be had under encumbrances like this, nor can we hope that this condition of things can by any possibility remedy itself. It is bound to become more and more aggravated as the city grows and traffic increases.

Street Congested with Traffic

If we have doubt in this matter we have only to note during the rush hours the enormous glut of traffic from tram-cars, automobiles, motor trucks, cabs and delivery wagons, backed up for a couple of blocks, with the poor pedestrian dodging for his life. Clearly the streets and crossings have not been designed and proportioned to accommodate and digest such an amount of traffic.

There is also the ponderous tram-car swinging round the corner to remind us that the Tramways Company holds sway, not only the roadway, but also the sidewalk itself.

And as car after car gradually works its way up to the crossing, each one freighted with a seething mass of concentrated humanity, and having its exterior decorated with

another contingent of quondam acrobats hanging on to the steps, after a free-for-all scrimmage between those who want to get off and those who want to get on, there is yet to be seen a goodly number of disappointed and disgruntled ones "left at the post."

It might be too optimistic to expect that even with proper and judicious town planning we should be able to eliminate the overcrowding of cars, but if we could succeed in stopping the overcrowding of streets and crossings we should then be in some sort of position to "talk" to the Tramways Company, and take away their only remaining valid excuse.

Common Sense Necessary

If we take a walk towards the down-town district, on the brow of the hill we see a horse struggling vainly trying to haul uphill a load about twice too heavy for it, sometimes shivering under the merciless lash of the driver. We shall notice that, if left to itself, and there is room for it, the horse will take a zigzag course, that is to say, instead of going full tilt up the face of the hill as the street has been laid out, it will seek an easier gradient in a diagonal direction. We are tempted to wonder what that poor dumb creature thinks, and what contemptuous expressions it would utter regarding the mentality of those responsible for its plight, and at the same time, we may begin to realize that town planning is not so much a matter of transcendental science or of art as it is of ordinary, every day, common horse sense.

As we reach the down-town district, perhaps the first thing we shall observe is that all the traffic is going in one direction. These are our "one way streets," not bad things in themselves as a merely temporary traffic exigency. They are, however, a self evident confession of incapacity and economic weakness and simple postponement of a better method.

Next we shall notice, lining the sidewalk, a long array of automobiles, laid wheel to wheel like batteries of guns, and we shall wonder what we are going to do ten years after this when the number will have multiplied manifold, unless perchance by that time the motor car will have been supplanted by the aeroplane and we may be able to get in and out of the upper windows without using the streets at all.

As we continue our journey further we come upon one of our public squares, where we might expect to see some grand old trees, fountains and monuments and we find that this too has been practically turned into an automobile parking stand.

We visit another, the historic spot where the founder of Montreal, Paul Chomedey de Maisonneuve, withstood the onslaught of the marauding Indians over two hundred years ago, and where his magnificent monument by Hebert is the dominant feature of the main Tramways transfer station, the marshalling ground of the noble army of strap-hangers.

I am sure if he could only see it to-day he would lay down his arms and take the first boat for France.

Nor is this all, for a little further on we reach another historic place where the tread of marching feet has echoed and re-echoed for generations, and there too we shall find the ubiquitous and all-conquering automobile occupying its section, while the remainder on certain days at least is made to serve as a huckstering market place all cluttered over with garbage.

Must Discover Solution of Difficulties

We are not for a moment trying to impugn the policy of our civic administrations in permitting these things. We perfectly realize that under existing circumstances they have been in a manner forced on them, and we are loath to believe they are more than mere temporary expedients. They are cited simply as an indication of "Breakers ahead!" and a warning that it is time to take our bearings and try to discover some more practical, fitting and permanent solution of the difficulties confronting us.

And as possibly we have stayed down town long enough to convince ourselves that from a traffic point of view at least everything is not as it should be, let us follow one of

*Paper read at the Town Planning Conference, Montreal, Sept. 29-Oct. 1, 1921.

the principal thoroughfares leading towards the upper town and there we shall find similar conditions of congestion, obstruction and delay. Indeed it is doubtful if in Montreal we can say we have a main thoroughfare worthy of the name. They are all too narrow, cribbed, cabined and confined.

But if we stray over into the bordering residential sections we shall find a different state of affairs, for there the streets are all too wide, just as wide, in fact, as our principal thoroughfares and there is really no necessity for this; it is both literally and figuratively throwing money in the gutter.

To be sure a great many people believe a street can't be wide enough, until they are asked to pay for the paving and for the maintenance and renewal. Possibly it will be said, "Oh well, it is the proprietor who pays for that," but don't you believe it, for it is with that as with other things, it all comes back to the ultimate consumer, and usually it is the working man that is the goat.

Character of Districts Change

And as we pave these residential streets just as we do the main ones, they at once invite heavy traffic and actually become through traffic streets. Then comes the corner grocery, the fancy goods store, the Chinaman, the tobacconist and the saloon; next the industrial flat, the shirt and collar factory, the cigar and paper box factory, with larger and heavier industries following in train. And one fine morning when you wake up you observe the men in the street digging up your beautiful pavement that you paid for in order to lay down heavier water pipes and larger sewers. And soon your rent, your taxes, and fire insurance premiums go up, and you begin to realize that all Montreal is on the move,—uptown.

The reason is that the factories down town have driven out all the respectable residents leaving a lot of tumble-down shacks that soon become infested with foreigners and the improvident, dens of misery squalor and vice, open cankerous sores, that eat into the body politic, and which are, one might say, about the most expensive and extravagant luxuries in which a city can indulge.

And it does not stay at that, for the factories soon find that the sources from which they have been drawing their labor supply is disappearing, and they start to get after it, invading the upper town districts, and leaving in their trail the slum areas they have created, and the large derelict tracts that we see of unoccupied and unproductive land.

This sort of thing is what is hailed by some people as the onward March of Progress, and it is fortunate for those keen-seeing and astute enough to be able to exploit and take advantage of the constantly fluctuating land values. It may even give the appearance of plenty of business and lots of work being done; but it is all lost motion, going round and round in a circle, putting up and pulling down, building and rebuilding, so much waste and nothing accomplished that is enduring or worth while.

A Comprehensive Plan Essential

How much better it would be if we would have a definite plan of development to work to, putting things in the places where they rightly belong and having them stay,—put.

That is to say, segregating industrial, business and residential property to the localities where each would be mutually advantageous and least detrimental to others.

Taking the factories, for instance, and all the industrial establishments and herding them together in districts close and convenient to the transportation systems, the railways, canals, and wharves, we could give them an economical concentration of ample water and sewerage services, power, lighting and heating facilities, special fire protection, and every accommodation and help they might require. This would improve their working conditions, reduce their production costs, eliminate a vast amount of unnecessary cartage, and to advantage all around.

In addition to this it would mean a wonderful saving to the city itself, for the heavy cartage would be guided

and directed along main thoroughfares proportioned and constructed to be able to provide relief to all the other streets which would not then be as they are now in a constant state of transition and upheaval through having new and larger water mains, sewers and power conduits put in. Fire risks would also be diminished and fire insurance premiums with them.

Even rent and taxes would be lower, for the occupation of the land and property speculators would be largely eliminated because land values would be stabilized, and undergo only a steady and gradual appreciation concomitant with the city's growth.

Besides benefiting the individual and the public generally, the city itself would soon be in a better financial position, and be able to provide automobile stands, transfer stations and market places without having to gobble up the public squares. They might be able to widen some of our main thoroughfares in a systematic way, or what is easier and just as serviceable, round off the corners of our most congested crossings, or better still provide circles introducing gyratory movement of traffic, thus lessening obstruction and minimizing the risk of accident.

Diagonal Thoroughfares

New main diagonal thoroughfares might be constructed at even less cost than street widening, for they could be designed to pass through least valuable property, and the enhanced value after construction might be sufficient to cover the entire outlay. These diagonals would be doing double duty of reducing the grades and shortening the distance, besides relieving the existing uptown and crosstown streets of their burdenn of traffic.

Many things like these and many other devices might be used to give much needed relief and work wonderful improvement if we could only make up our minds to go about it in a systematic and comprehensive way.

Perhaps it is not forgotten, and it should not be forgotten, that only a few years ago many millions of dollars were sunk by the city in useless expropriations and clumsy and abortive attempts at street widening. And the reason is not far to seek, for instead of making a thorough diagnosis of the condition of the patient and getting down to the roots of the disease, they were only administering palliatives and treating the mere symptoms as they appeared on the surface, while the disease itself was allowed to run unmolested, eating into our very vitals, which it still continues to do.

I sometimes think that town planning is like grasping a nettle, if you do it in a gingerly way it stings you, but if you take hold of it with grim determination it will be harmless and prove all to the good.

And of all the evils and bottomless sinkholes of perfectly good money, this piecemeal town planning, this tinkering, is the worst,—carrying out a bit of street widening here and street extension over there or suggesting a big boulevard somewhere else, most of such movements springing from more or less self-interested motives. It may be possible to effect a little improvement here and there but never in a way commensurate with the expense, and you are dead certain to get into greater trouble at some other point.

If this thing is to be tackled in a serious way with the expectation of arriving at anything worth while it must be by taking the city and surrounding district as a complete entity, studying its whole fabrique, and working on a general scheme of development from the bottom up. And if you asked me "what is the bottom?" I would say at once it is the Railroad Transportation Problem.

Should Co-operate with Railways

The railways are the one thing you can least juggle with, as some of our friends from Toronto may be able to tell us. And yet it may be possible to eliminate a certain amount of that needless duplication of rival surface lines and terminals which, at present, have such perilous and paralyzing effects. We can only do this, however, with the help and co-operation of the railway companies them-

selves, and fortunately for us, the day is past when the railways seemed to be run on the principle of "Ourselves alone and the People be Damned." The managements of today are intelligent and alive to the fact that what is in the best interest of the public is bound in the end to be to the advantage of the railways.

The railway transportation system and the street transportation system must be made to link up and dovetail in together so that each will be the useful and helpful adjunct of the other, instead of being, as now, often in serious and open conflict.

We must bear in mind that it is necessary not only to have main thoroughfares of ample capacity and reasonable grades but that it is necessary to have a street transportation or main arterial system.

Zones

Our factories and industrial establishments must not be strewn promiscuously all over the place, but arranged and located in an orderly and intelligent system.

Similarly also our shopping and business premises should be confined to certain streets and localities in some sort of system that will be most advantageous to themselves and least detrimental to others.

And in particular our dwellings and residences should be kept free of invasion from factories and business concerns, so as to keep down the rents and taxes and at the same time preserve that wholesome, sweet, clean and quiet reserve that is in keeping with the idea of home.

We need more parks and recreation grounds and especially a more equitable distribution of these in the localities where they are most needed, in fact a Park System, linked up by creditable tree shaded driveways or boulevards and not as at present to be approached only through mean squalid unbanked streets.

No doubt it will be said that while all this may sound very well in theory, it is quite another matter to work it out in practice. I quite agree with that, and I would like to say that our success will depend very much on how we go about it, if we ever attempt anything of the kind. Other great cities are trying it and effecting wonderful improvements with beneficial results. Indeed Montreal can only come in now at the tail end of the procession, for there is not a city of anything like its size and importance on the American continent that has not some scheme of development.

Comprehensive Plan Necessary

What is wanted is a general comprehensive plan as a clear objective towards which we can gradually work. The carrying out of the plans will not be the work of a day or a year or even five or ten years; perhaps few of us here would ever live to see its consummation. But we need to make a start in the right direction and along proper lines and not be, as we are now, a ship at sea without a chart or compass and without even a man on the lookout, drifting, drifting,—“We don't know where we're going but we're on the way.”

Another objection likely to be raised is that we are starting in to interfere with individual interests and the rights of private property, and my answer is, it is about time we did, for they have been interfering with and overriding us long enough. If there is one thing more than another that has brought us into this mess it is the assertion and exercise of individual privilege over public interest and the common good, the only remaining thing left to the public being the privilege of paying for it all, with little or no voice in the matter. But town planning is in the interest of all and ultimately for the best interest of every single individual.

Again, it will be said, “It is too late, we have gone too far, at least as regards the built up portion of the city.” That is to say that Montreal is in the position of the small boy with his catechism lesson. He had got past “redemption” and was beginning to “endure the pains of hell forever.” Well, I am not one of those who believe that; and

in any case, how is it we are so apathetic regarding the unbuilt portion of the city? We recognize that things are bad in the centre, and we are doing precisely the same thing on the outside, only we are doing it worse than has ever been done before, and we are doing it over a much greater area. For if we look out there among the stubble, and carefully examine the surveyors' stakes we shall find a bountiful crop of expropriations for street widenings, extensions, and adjustments growing up, under the burden of which unless corrected in time the city of Montreal will go staggering for generations.

Embryo Slums

We talk, too, about hygienic measures for the prevention of disease and the uprooting of slum conditions while we are making them with the one hand faster than we can unmake them with the other. By the way I was cautioned above everything not to say that Montreal had such a thing as ‘slums,’ and I am not going to say that it has, but I will say that out there in what is now nothing but pretty green fields you can find slumdom in embryo, lots of disjointed, broken backed, dead end streets, which, cut off from the general circulatory movement, must in time become the refuge of the foreigner, the nestling and breeding place of dirt and disease, and the hotbed of the epidemic.

Economy of Planning

But perhaps the last and seemingly insuperable objection is certain to be raised, it is this: “The city of Montreal has no money for town planning, there are many more important and pressing things to be attended to before that, so there's an end to it.” I confess that somewhat floors me, but I am tempted to ask, as many another has done before me, why a prosperous and wealthy city like Montreal has no money. I know of course there have been numberless allegations about graft, mismanagement, and so forth. Now, I don't know anything about that and am not going to say anything about it, but this I do know and will make the statement without equivocation, that the main reason why the city of Montreal has a deficit today is because all the city governments we have ever had have been too busy working on the surface, tackling results, and have never been able to get down to first causes. Even the best intentioned of them have been valiantly trying to stop the waste by holding their hands over the burst pipe without stopping the flow of water at its source. And I will further say that if the city of Montreal can't afford to get a systematic plan of development, it is mainly because hitherto it has not had such a plan. And until it gets one, an good and well considered one at that, the city will keep on leading the hand-to-mouth existence it has been doing, and that condition will steadily continue to get worse instead of better, no matter what we do.

Before closing I would like to say a word or two regarding the embellishment of Montreal, about which a good deal has lately been spoken. Candidly, I have no liking for the world, it savors in my mind entirely too much of artificiality, and in any case is beginning at the wrong end. If we can plan wisely and well on useful, economical, orderly and symmetrical lines, the city will naturally embellish itself.

But what worries me is that we have already been going in for that sort of thing, laying out parks and squares in the conventional Union Jack pattern and planting rows of trees spaced with dull and deadly regularity, on isolated patches of ground that are as bare and bald as a pole-cat, while our eyes have been blind to the real beauty spots we already possess, with magnificent outlooks over the river, and with noble majestic trees, the growth of a century. On the trunks of some of them you will see big notice boards nailed, with the inscription “Fine Factory Sites for Sale.” Now if we were careful to conserve some of these before they are racked and ruined, we should be doing more for the embellishment of the city than we could do in fifty years of artificial work.

In passing, let me put in a plea for "Our Friends, the Trees." It is not so many years since Montreal used to be called the "Forest City," but I don't think anybody would care to call it that to-day. The ravages of insects, the natural process of decay, the clumsy butchery of the electric lineman, and the curiously mistaken notion that trees have no place in a business section, have all got in their deadly work, and the city is fast becoming bare. Now if we have any notion of going in for the "City Beautiful," and I would like to add the "City Sensible," we can't do better than emulate the example of other cities who are spending a lot of money to save the trees they have, and plant as many new ones as they can.

In conclusion would it not be well if we could hold up before our eyes some sort of ideal towards the consummation of which we could steadily strive to attain. I believe there is a certain big city at the head of the lakes which has already appropriated one, it is to be called the Paris of the American continent. From one of the dingiest and worst planned cities it has made great strides in recent years, and by voluntarily taxing itself for the carrying out of wonderful improvements under its famous plan of development, it has been doing its utmost to deserve that appellation. In this sort of thing, however, it is not so much a question of "Who saw it first?" as it is of who can make good its claim to the title. And surely the second French city in the world to-day is not willing to stand idly by with folded arms while the guerdon goes past it. If we can only make up our minds to begin, we have within us all the elements of success. With the fine artistic sense of the French as already exemplified in the works of Hebert, Laliberte, Suzor-Cote and many others, together with the inimitable instinct of that race in seizing hold of the joy of living, and getting the most and the best out of life; and the energy, enterprise and sterling business qualities of the English speaking nationalities—with these blending and operating in unison what is there to stand in our way?

This then I commend to you as the goal we should strive for, and which we may ultimately reach:—"Montreal le Paris de l'Amerique."

GOOD ROADS ASSOCIATION MAKES PROGRESS*

Review of Work of Ontario Association Since Organization
— Work Being Efficiently Done — More Interest
Being Taken in Township Roads

By T. J. Mahoney,

President, Ontario Good Roads Association

IT CAN safely be said that the progress and the sentiment in favor of road improvement in the Province of Ontario has been parallel with the progress of the Ontario Good Roads Association. The Association was organized in 1894, and in 1896 we had a provincial road instructor appointed whose object was to make uniform the building and construction of our highways. In 1902, the Highway Improvement Act as passed, under which the Province of Ontario laid aside \$1,000,000 for the improvement of county roads in the province, on the basis of 33% for construction purposes. In 1912, there were \$5,000,000 set aside for the construction of colonization roads in the northern part of the province. In 1913, the Highway Commission was appointed whose purpose it was to investigate road construction and road financing, not only in this country but in other countries as well, and it is largely on the excellent reports which that Commission submitted that our present highway construction and highway financing is to a large extent based. In 1915, legislation was brought in which provided for the establishment of provincial county roads under which the government proportion was increased on those roads to 60% instead of 40%.

*Presidential address before Ontario Good Roads Association Convention, Toronto, March 1.

In 1917, the Provincial Highways Act was passed, and it is not necessary to refer to the great increase which has been made in the highway legislation and road improvement since that Act was placed on the statute books. I think you will agree that we have reached a stage where public sentiment has advanced so far that plenty of money will be available for road improvement, providing the people are satisfied that that money is spent economically and to the best possible advantage.

Well Balanced System of Roads

We have in this province a very well balanced system of roads. We have our provincial highways which are under the direct supervision of the Government, which are financed and constructed by the Highway Department. Of these roads we have 1,800 miles connecting the main centres of our province, and they are intended to carry the bulk of the through traffic. We have close to our urban centres provision made for suburban roads to which the cities or towns and the counties will contribute a share, and they are also assisted by a percentage from the Government. Then we have our ordinary county roads on which the Government pays 40%, and last but not least, we have our township roads which, so far as mileage is concerned, are the most important divisions of our roads in this province.

It is not necessary to refer to any extent to the provincial highways. The efficient corps of engineers which the government has constructing these highways is good evidence that the work on these roads is being done efficiently and well. So far as the counties are concerned, they have for the most part been engaged in highway construction since 1902, and they have had a great deal of experience in road organization and road construction, and we can safely assume that in most of the counties of this province, our county road work is being done efficiently and economically.

Township Roads

When we come to township roads, there is no question that this important link in our system has to some extent been overlooked in the past. It was only two years ago that legislation was placed on the statute books whereby the province was to contribute 20% on the work done on these roads provided it was done under certain regulations. Since that subsidy has been granted, there has been a greater interest taken in the work on our township roads. Your executive realizing the importance of greater interest in connection with the township road work, has devoted one complete session to the consideration of township road matters, both as regards construction and road accounting and financing. "Who should pay on Provincial Highways" is an interesting subject for discussion and it is a subject on which the people in this province who are beginning to feel the effects of the tax will be interested.

The Ontario Good Roads Association has been during the years it has been established, as it were, a leader and an educator of public sentiment with regard to road matters, and while the final say with regard to legislation rests with the Government and the Highway Department, I think it can be truthfully said that the expression of opinion given at this convention and through the members of this association will not fall on deaf ears.

That American cities are making tremendous strides in street paving is indicated in reports from city engineers to The Asphalt Association, which show that over 270,000,000 square feet, or 1750 miles, of asphaltic pavement, thirty feet wide, will be laid on city streets this year. Reports from State Highway Departments indicate that 207,000,000 square feet will be laid on the State highways, while the area laid in counties and other districts will bring the total to 585,000,000 square feet, or 3690 miles, of asphalt pavements, thirty feet wide. This will be an increase of 35 per cent over the area paved in 1920, and is sufficient to build an asphalt road thirty feet wide from Augusta, Ma., to San Francisco, Cal.

GOOD ROADS SYSTEM IN ONTARIO*

Assistance to County Roads Under Highway Improvement Act — Government's Subsidies for County Roads — Type of Road Giving Satisfactory Results

By Hon. F. C. Biggs,

Ontario Minister of Highways and Public Works

AS ONE travels from place to place and interchanges ideas with municipal officers, it seems that everyone wants better roads, but the big difficulty confronting that idea is impatience on the one hand and lack of funds on the other. It is impossible to build roads everywhere all at once, and so it is up to the officials in the counties and the townships to single out the roads that will do the most good and build them first. And as you build them do not lose sight of the fact that within the last five years the motor cars of this province have increased from about 40,000 to over 200,000.

The convention this year is probably the most important up-to-date on account of the many townships that have adopted the good roads plans, appointing superintendents and enlarging their scope and interests in road work. Another reason why it should be the most important is the fact that the counties are spending more money on roads than ever before in the history of the province. With these large expenditures it is well for the officials of the counties and townships to keep in close touch with the very latest ideas that may be carried out in the different municipalities and on the Department Highways.

At the present time, the Province of Ontario and the world in general is suffering under a heavy depression. During the war period, prices became inflated and we based too many of our calculations on those conditions. Now prices on agricultural products have gone back to practically pre-war levels, and a great responsibility rests on the shoulders of the municipal officers in the counties and townships, for while the prices were gradually increasing, there was only one thing to do as far as materials and wages were concerned, and that was to buy at the best price, but at the present time materials are coming down, and municipalities must use their best judgment as to the proper time to buy. But probably the most important factor is the factor of wages. Wages went up on account of the scarcity of help, but today in the Province of Ontario we have a great unemployment situation. While we want to do the work as reasonably cheap as we can, we do not want to persecute those whom we employ; we want to use them at least fairly at these times until the necessities of life reach a normal level again.

Adequate Drainage Essential

I want to say a few words in regard to road expenditure, the mileage undertaken and the way the townships are taking hold of the work. The one great essential in the development of roads is not the surface that is put on the road, but the drainage. We have thousands of miles of gravel road in the Province of Ontario today that is going to pass through the fall and spring seasons of the year in poor condition on account of inadequate drainage, and when we put down the higher type of road, we never think of leaving it until it is properly drained in every respect. Is it not just as important that the gravel and macadam road should be properly drained and maintained, as the better classes of roads? We have thousands of miles of gravel roads in the province that would give twice the wear with half the maintenance if the drainage was properly looked after. The one great essential to my mind in road building in the province today is the drainage of the road.

During this last year a new way of carrying out county construction was undertaken in several municipalities. I

might mention two cases: one is in a rural district and the other in a suburban district. The first one is in Halton County, directly north of Oakville on the line running north to Georgetown. On this road which is situated in a heavy clay country, a concrete strip 9 ft. wide has been put down, with 3 ft. stone shoulders on the sides. This seems to answer the need there very much more rapidly and very much more economically than if that county had stopped to build the full width of roadway. That road carries a medium traffic, and undoubtedly a very large percentage of that traffic can be handled on the concrete strip, and the stone shoulders will only have to take the turnouts. I have had reports given to me that at least 98% of all the travel over that road will be on the concrete. We have the Township of Trafalgar, without any road material at all, into which every bit of stone or gravel to build a road had to be shipped, and if the county had waited to build the full 18-ft. road there would have been only half the stretch served by a permanent road as is served today, with the same expenditure. It seems to me that at the present time many roads could be well served with that type of construction.

Then just out of Brantford on the Burford road, in the suburban district, the county engineer has put down another 9-ft. strip, but this time the road is all on one side with the idea that later on another strip will be added giving the full width of road. Gravel has been placed on the side that is not paved. That strip is carrying a large percentage of the traffic, and if the Suburban Commission had waited to extend the road out the entire distance, only half the distance would have been served.

When the Toronto-Hamilton Highway was promoted, there was a difference of opinion as to the route that should be taken, and so from King's Junction down to Freeman, we have a 9-ft. strip of road partly in Wentworth and partly in Halton; it has stone shoulders and has been down some years now, and the cracks in the slabs are not nearly as numerous as where the road is wider, and this strip seems to be giving the public splendid satisfaction and serving the purpose fully for which it was intended.

Assistance Under Highway Act

This last year we have been able to co-operate with several counties in assisting the towns and villages with county and provincial-county roads in having the connecting links brought into shape. Last year it was the policy of the Department in the amendment passed to the Highway Improvement Act of 1920, to pay back to any county the money granted to town or village or provincial-county roads of 40 or 60 per cent that the county makes to that connecting link. Having watched the building of county roads for some years, I have found that very often the weakest link in the county road is in the town and village. These towns and villages have contributed, without any grant from the county, on the same assessment rate on the equalized taxation as the townships, and until last year no subsidies were paid back on the connecting links. We find this is bearing splendid fruit. Kent County has taken hold of it splendidly, and several other counties, and I am sure it will bring good results, but the one outstanding feature in road development this past year has been the progress that has been made in township roads. A great many of the townships in the province have taken advantage of this assistance, and I have some figures that may be of interest to you in this connection. Out of 376 townships eligible for the aid, 299 have passed the necessary by-laws in 1921 and will receive their 20% on their road expenditure in their townships; out of 299, 152 have appointed township superintendents on whose salaries they will receive 40% assistance.

This is a new line of assistance on roads, a line of assistance which I think is very worthy in its motive, because I think you will agree that per mile of road, the township road has fewer taxpayers to pay towards it or look after it than any other road in the Province of Ontario, and while we may have developed fairly good pro-

*Address before Ontario Good Roads Association Convention, Toronto, March 1.

vincial roads and good county roads, still the great essential is that people on the townships roads should have a road to get to these trunk lines. I believe this assistance is going to do for these roads the very thing we need to add stimulus and give some enthusiasm to township councils in carrying out that work. Of course this will not be felt to the full degree until we get the township returns in for 1921, as most of the townships came in during 1921. As soon as these returns are in, to any township that has spent \$5,000 on road improvements and bridges, we will send them back a cheque for \$1,000; then that cheque coming in after the rate has been struck for the townships, and it adds an extra \$1,000 or \$2,000, as the case may be, it should do a great deal towards raising the standard of the township roads.

Review of County Road Work

I will give you a short history of the county road work. The Highway Improvement Act was passed in 1902, just twenty years ago this season, the first county came into the Good Roads System. It took from 1902 to 1918 to get the 37 counties in the Province of Ontario to enter the system. The County of Wentworth was the first county to come under the Highway Improvement Act; Simcoe and Lanark followed quickly along late in 1902 or early in 1903. Then the counties gradually came along until 1918, the County of Peterboro came in, in part, and now the whole 37 counties are in under the Highway Improvement Act. Since the beginning of 1919 the county mileages have not increased to any appreciable extent, because approximately 1,800 miles of provincial road were taken from the county mileage.

Grants to County Roads

It is interesting to follow the figures in connection with the grants. In 1903 the government subsidy to county roads was \$55,383; 1904, \$97,000; 1905, \$59,000; 1906, \$82,000; 1907, \$127,000; 1908, \$147,000; 1909, \$146,000. Then we jump to 1917, when it was \$475,000; 1918, \$815,000; 1919, \$2,623,000; 1920, \$3,626,000; 1921, \$4,750,000 approximately. You will notice that the greatest yearly increase has been from 1918 to 1919; then there has been a considerable increase the last two years, until we have over \$4,500,000 subsidy paid back to the counties, with a total expenditure in the counties of about \$10,000,000.

The county councils are the elected representatives of the people and they have to go back to their electors, the taxpayers, once every twelve months for endorsement of their position. If this increase the last three years speaks the voice of the people, as it must, then public sentiment in roads in the Province of Ontario, as demonstrated through their yearly elected representatives, is greatly on the increase.

This opens up a big field as to whether we are going too fast or not. That is a matter for you as municipal representatives to decide when you weigh up your local conditions. Personally I do not think the roads are being built too fast in proportion to the increase in motor traffic. The success of this country entirely hinges on the success of the rural people, and if we want the rural people to forge forward so that we will be able to meet the debts of this Dominion of Canada, will an investment in roads retard or aid them? To my mind, an investment in roads, if we want to pay our war debts and make rural life comfortable and profitable, is the best investment we as citizens of Ontario can make. I have ceased to speak about expenditure in good roads; I claim it is an investment, and the highest type of investment.

We have in this province, counties that have been in the good roads system for 18 and 20 years, gradually adding to their mileage; we have other counties who have been in for ten or twelve years working steadily along, and then we have counties who have come in within the last three or four years and who are trying to overtake the other fellow, who has been at it for ten or fifteen years.

We are trying to develop the provincial roads as uniformly as possible over the province, and with the 1,800 miles we now have, and when these roads are developed, over 90% of all the population of old Ontario will be served, and the many, many miles of county roads and township roads which are now being worn out as fast or faster than the municipal officers can build them, will be relieved of a large share of their traffic, and the expense to the municipalities will be much lighter on these roads.

NEW HIGHWAYS ACT FOR ALBERTA

THE proposed new highways act for the Province of Alberta provides for an appointive highway commissioner and a good roads board. The board is to be composed of the deputy minister, the highway commissioner, and three other members to be appointed by the lieutenant-governor in council.

The commissioner is to be the chairman, and three members shall form a quorum; salaries of the board to be fixed by the executive council. This board is to have complete control over all highways in the province to determine classification, suitable methods of construction and maintenance, recommend allocation of money to be spent on them voted by legislature, and to make all rules governing the roads, including speed and equipment of vehicles.

Highways are to be classified as main highways, market roads, local roads, colonization roads. The main highways are to be trunk channels of communication between cities and towns or with main travelled roads, and entire cost of construction and maintenance is to be defrayed by the province.

Market roads are to be roads of less general importance, but of outstanding local importance in the market of produce in the area where the road runs. Entire cost to be borne by local authority of area where road runs, but provincial contributions may consist of amounts to that percentage of the cost of the work set out in a schedule as follows:

Clearing, grubbing, ditching, construction of timber culverts and bridges, grading and such other work necessary to provide earth roads, 33 1/3 per cent.

Road surfaces of sand, gravel or clay, 50 per cent.; constructing concrete culverts, 66 2/3 per cent.; constructing steel or concrete bridges costing more than \$2,000, 66 2/3 per cent.; constructing steel or concrete bridges costing more than \$2,000 and not more than \$10,000, 75 per cent.; constructing steel or concrete bridges costing over \$10,000, 100 per cent.

Local roads are to be all those not classified as main highways or market roads, construction and maintenance to be paid for by local authorities in the area in which the road runs.

Colonization roads shall be such roads as may be temporarily established for development of newly settled districts "or for other good reasons." Their construction and maintenance shall be paid by the department.

Windsor, Ont., has more concrete pavements in respect to its size than any other city in America, according to a statement by W. A. McLean, deputy minister of highways, before the Ontario Good Roads convention. Not only that, said Mr. McLean, but it has the oldest concrete pavements of any city. M. E. Brian, city engineer of Windsor, stated that Windsor has a total area of one and one-quarter million square yards of concrete on its streets. Last year every crack in these pavements was tarred, and this year the city will execute a still larger program of improvements. Those streets which have not been paved for 15 years are "pretty well shot" now, he said; but, in consideration of the fact that the pavements were laid at a cost of \$1.01 1/4 per yard, they have served well. It has cost the city 45 cents a yard to maintain them.

MAINTENANCE OF GRAVEL ROADS*

Importance of Adequate Drainage in Road Maintenance — Stable Foundation Essential — How and When to Use a Drag — Laying Gravel and Rolling

By D. J. Kean,

Superintendent of Highways for Ontario County.

TWO OF the most important points to be considered in the construction or maintenance of a road are drainage and foundations. It does not matter whether the surface be earth, gravel, macadam or concrete, its life depends on a stable foundation. The stability of the foundation depends on adequate drainage, for a subsoil saturated with water cannot furnish a good foundation. We employ three methods of drainage for our roads. To drain the surface of the roadways we give them sufficient crown to shed the water into the side ditches which are provided to carry the surface water to a free outlet. Under-drainage is used to lower the water level in the soil and keep it at a safe distance from the foundation and also to centralize the location and direction.

Under-Drainage

Under-drainage intercepts the flow of sub-surface water beneath the crust of the road. In this way the ground dries quickly in the Spring avoiding a soft and spongy road that would soon become a mass of mud. A road on a wet undrained bottom will always be troublesome and expensive to maintain, and when you consider the expense the municipalities having jurisdiction over these undrained sections of road are confronted with each Spring, and the inconvenience the travelling public are subjected to, tile under-drainage and proper side ditches are surely beneficial and economical. It is therefore economy in the long run to go to considerable expense in making the drainage of the sub-soil as perfect as possible.

Particular attention should be given to under-drainage at points 50 to 200 ft. or more down grade from the top of a hill, and particularly so if the roadway is in an excavation also a sidehill cut. Water will filter out to the surface at such points and the entire skill of the road builder will have to be exercised to prevent the road heaving and breaking up into a mire in spring time. In such cases put in ample tile, do not curtail the under drainage, but care must be exercised to provide a proper grade and a good outlet for the tile otherwise poor results will be obtained if the tile is indifferently laid. Sometimes a blind drain may be used to good advantage.

Side ditches and a proper crown are essential to all country roads, the object of the side ditches being to drain the water from the travelled roadway. The grade of the ditch should be such that the water is carried rapidly to a good outlet.

Surface drainage of the travelled portion of the road is accomplished by giving it a crown, the proper crown will vary with the nature of the roadway. For earth or gravel roads a usual crown is from $\frac{1}{2}$ in. or 1 in. to a foot. It is not good policy to have too much of a crown, for then the traffic is concentrated in centre whereas we wish to distribute the traffic over the whole of the travelled portion of the road.

Methods of Maintenance

When the gravel road requires dragging at frequent intervals, it may be due to the gravel becoming worn out, having very little metal left in it, at the same time being subjected to unusually heavy traffic or to extremes of wet or dry weather. It is good economy to spread a thin layer, according to the condition of road and traffic requirements, of fine pit or cementitious gravel over the surface and rolling it if a roller be available. If not the traffic will compact it by reason of the fineness of the materials and the thinness of the layer.

Two principles are involved in the use of the drag. The first is the length and position of the hitch, and the second is the position of the driver on the drag. For ordinary purposes fasten the clevis on the chain at such a point so that the drag unloaded will follow the team at an angle of 45 deg. In this position the earth moves freely along the drag, and the draft on the team is light, if the driver rides in the line of the draft. Sometimes conditions are met with that require special treatment but for the most part road working with this implement is very simple. The object of such treatment is to move the material from the side toward the centre of the roadway, to fill the holes and ruts and to raise the centre gradually above the surface at the sides; there will generally be found considerable good material at sides of road which has been crowded out by traffic. This material if not dragged in toward the centre of the road will soon accumulate and prevent water from escaping to ditches. The traffic then will solidify the fresh material in the ruts and holes. Another implement by the use of which very satisfactory results can be obtained is the one-man-one-team grader. This in many cases is superior to the split-log or steel drag for levelling, but both implements serve a good purpose when in the hands of a competent operator.

When to Use the Drag

The drag does its best work when the soil is moist but not sticky, the material then moves freely along the blade. If the roadway is badly rutted and full of holes, it is best to use the blade grader at least once. This is particularly true in the Spring just as the frost is going out. A smooth road surface is secured by this method.

Bring the road to a suitable grade and cross section and provide ample side ditches and if sub-surface drainage is required, put it in.

The gravel is dumped on the road in such quantity that it will spread to the thickness desired and then spread with shovels or by light blade grader, which saves time and money and does better work than by hand.

A thin layer, 3 to 5 in. thick, has proven economical. It quickly consolidates and gives smooth surface. A drag is very useful for maintaining the surface during this period and if the dragging is done carefully after the rains, a smooth even durable surface will result.

Pit gravel falls into four groups: (1) Ideal gravel. (2) too coarse, (3) too fine, (4) lacking in bonding material. The bonding property of gravel is due to clay, iron oxide, lime and the angular shape of gravel; the clay should not exceed 20%. Gravel should be well graded from a size that will pass a 2-in. screen down to fine clay, no more than 80% nor less than 60% should pass a $1\frac{1}{2}$ -in. screen.

Roller and Scarifier

Good economical maintenance can be accomplished by using a scarifier and roller. The gravelled portion of the road is scarified to a depth not to exceed 3 to 4 in. Even this depth will on the ordinary country road dig up considerable stones of a rounded shape, it is not advisable to rake or throw these off, but better policy to have at least 2 men follow the scarifier with light tapping hammers weighing about 2 or 2½ lbs., with long springy handles. These stones are made angular in shape by breaking and when again covered with gravel and silt, they will work in to the road and bond better with the other material on the road, and not so liable to shoot sideways when subjected to the pressure of the traffic as they did formerly. After the stones have been broken, the road is reshaped with a light grader and rolled.

This method of maintenance will average $1\frac{1}{2}$ miles a day and cost approximately \$25 to \$30 depending on length of haul of water and coal. A gravel road requires intelligent maintenance, but if given this it gives us a road surface that is comfortable to travel, affords good traction and is easily maintained under normal conditions. It is cheap to construct and will furnish the material for our road surface, for 75% of our roads for many years to come.

REVISION OF AN IMPORTANT WORK ON MILL BUILDINGS

Reviewed by C. R. Young,

Associate Professor of Structural Engineering, University of Toronto.

DESIGN OF STEEL MILL BUILDINGS AND THE CALCULATION OF THE STRESSES IN FRAMED STRUCTURES—By Milo S. Ketchum, Director of the Department of Civil Engineering and Professor of Civil Engineering, University of Pennsylvania; sometime Dean of the College of Engineering and Professor of Civil Engineering, University of Colorado; Consulting Engineer. Fourth Edition rewritten; New York: McGraw-Hill Book Co., Inc.; Flexible imitation leather; 6 by 9 in.; pp. 632; Illustrated; \$6.00; plus exchange.

Professor Ketchum's works on structural engineering have been for so long regarded as authoritative treatises that any extension or revision is regarded by those engaged in structural work as a matter of considerable importance. The present work in its earlier editions has had a most gratifying reception, constituting, as it does, the most generally useful work in English on the subject of mill buildings. In the fourth edition the book has been rewritten and enlarged from 556 to 632 pages with the type reset, the plates recast and large numbers of the cuts remade.

Important extensions in the subject matter have been made in this edition. Its scope has been enlarged by the inclusion of a concise discussion of the calculation of stresses in statically-indeterminate trusses and frames, by several problems in framed structures, by detailed designs of a crane girder, a roof truss, and a steel frame mill building. The whole work has been rearranged in logical order, based on the inclusion of the new material.

In the present edition the many problems relating to stresses in bridge trusses have been retained, although it is somewhat illogical to include discussions of this sort in a work on steel mill buildings. The purchaser of such a book is not looking for such matter in a treatise on mill buildings and it would undoubtedly be more logical for the author to replace this material by corresponding material relating to buildings and use the bridge matter in his other works where a discussion of bridges is naturally to be expected.

A valuable extension of the matter on influence diagrams contained in the third edition has been made in the present edition. The stresses in transverse bents are discussed at further length and the addition of a short consideration of the stresses in mill building columns due to crane loads is welcome. In chapter 12, which is devoted to combined and eccentric stresses, new and valuable matter is included on the properties of sections and on the oblique loading of beams. Much new matter is also contained in chapter 14 on area moments and curved influence lines. The discussion of deflections of framed structures in chapter 15 is specially good, although it savors perhaps too much of a bridge treatise for a work on mill buildings. The large amount of new matter on stresses in statically-indeterminate structures contained in chapters 16 to 18, inclusive, is presented in Professor Ketchum's well-known clear and concise style and constitutes a valuable short contribution to the subject. Secondary stresses discussed in chapter 19 are also appropriately included. A good deal of value is added to the work in the present edition through the extension of practical examples, such as the computation of stresses in a statically-indeterminate head frame and in other similar structures, the design of a steel roof truss with a detail drawing, the design of a plate girder for a crane runway and the complete design of a steel mill building with details. In an appendix a revised edition of Professor Ketchum's general specifications for steel frame buildings is included.

For the convenience of those using the author's works it is suggested that greater amplification of the index should be followed in future editions. Thus, for example, if one wishes to find out where a particular aspect of the subject of bracing is discussed, it is necessary to turn from the index to eight different pages in the work in order to discover the particular reference desired. It is believed that the addition of a few more pages making possible the greater sub-division in the index would be welcomed by busy designers.

Considered in a broad way it must be said that the present edition is a most valuable and necessary working volume for the design of mill buildings.

THE ARCHITECTS' AND BUILDERS' HAND BOOK: DATA FOR ARCHITECTS, STRUCTURAL ENGINEERS, CONTRACTORS AND DRAFTSMEN—By the late Frank E. Kidder, and a staff of specialists, with Thomas Nolan, Professor of Architectural Construction, University of Pennsylvania, as Editor-in-Chief. Seventeenth Edition, Enlarged; New York: John Wiley & Sons, Inc. Flexible imitation leather; 4¼ by 7 in.; pp. 1907; Illustrated; \$7.00 net.

In the enlarged seventeenth edition this well known handbook has been made still more valuable for architects, engineers, contractors and draftsmen. The work has been revised, several chapters rewritten, new chapters added, a new index made and many cuts re-engraved.

Most of the extensions have been made in Part II, which is devoted to Strength of Materials and Stability of Structures. Chapter XXX, by Robins Fleming of the American Bridge Co., on Specifications for the Structural Steel Work of Buildings is new. In this chapter a reasonable and thoroughly reliable specification based on the long experience of the author is presented. Chapter XXXI, on Domic and Vaulted Structures, by Edward F. Ries gives a clear presentation of a most difficult subject, including discussion of Smooth-Shell Domes, Ribbed Domes, Barrel Vaults, Groined Vaults, and Ribbed Vaults. Chapters XXIII and XXIV on Fireproofing of Buildings and on Reinforced Concrete Construction, respectively, have been rewritten by the author, Rudolph P. Miller. The material in these chapters has been brought up-to-date and in line with revised specifications and developments in the art.

In Part III which gives useful information for architects, builders and superintendents, the sections on Heating and Ventilation and Chimney construction have been entirely rewritten by Louis A. Harding.

In addition to the entirely new chapters, very many articles have been added to the text and new illustrations made, this including such matters as New Data on Building Laws Relating to Loads on Masonry; Graphical Method of Determining the Centre of Gravity of Plane Figures or Sections; Graphical Method of Determining Moments of Inertia of Plane Figures; Triangular Loading; End Connections of Tension-Members; New Wire Data; New Matter on Gauges; New Matter on Chains; Graphical Method of Determining the Deflection of Beams; Secondary Stresses; Angles Used as Beams; Data on Girderless Reinforced-Concrete Floors; Data on Tanks, and on Stresses in Cylindrical Tanks, etc.

In its present form the Kidder-Nolan handbook is a most valuable work of reference for those having to do with building construction. The various chapters and sections dealing with engineering matters have been prepared by specialists of very high standing, and the reader may rely on the accuracy and authority of the matter presented. No structural library is complete without a copy of this handbook.

The Carter-Halls-Aldinger Co., of Winnipeg, has now opened offices in Edmonton, from which they will handle roadwork, drainage and irrigation, railway work and building construction throughout the province of Alberta. John C. Weston is the manager of the Edmonton branch, which has established offices at number 430 Tegner building.

Letters to the Editor

CORRECTIONS

Sir: Will you please note the following errors which have occurred in the printing of my letter on the subject of "Libraries for Research Workers," which appeared in your issue of March 7, due, no doubt, to the conditions under which you are working during the printers' strike:

Fifth paragraph first line, for "together independently" read "altogether independently." Fifth line, for "of the great advantage," etc., read "to the great advantage," etc.

In the list of advantages given lower down in Clause (e), for "understood" read "undertaken."

The clause which you have designated "g" should be clause "f," and clause "g" does not exist in the original of my letter to you. On the third line of this clause "f," for "of firm," read "or firm."

I shall be glad if you will kindly correct these errors in your next issue, as they make my letter to appear a trifle lame.

A. S. L. BARNES.

Toronto, Ont., March 9, 1922.

ST. LAWRENCE WATERWAY

Sir: In your editorial of January 31, re "Rival St. Lawrence Waterway Projects," certain mis-statements are repeated from the report of the Hydro-Electric Power Commission of Ontario.

In the third paragraph of the above mentioned editorial, it is stated that "an advantage of the Hydro scheme 'B', as against a single-stage scheme such as 'A', or that proposed by the government engineers, is, as stated by the proposers, a reduction of the area flooded from 29,000 to 6,000 acres." This is incorrect, as the scheme proposed by Messrs. Wooten and Bowden, at the highest emergency level, only inundates 2,960 acres above the Ogden Island dam, only 8,900 acres between the Ogden Island and the Barnhart Island power houses, and only 400 acres from Barnhart Island to Cornwall. It is true that some provision is made for a future change in project, but this change is not part of the recommended scheme. Even if the maximum level of Lake Ontario were carried to the Barnhart Island plants, without any Ogden Island dam intervening, as advised by General Beach, Chief of the U. S. Corps of Engineers, the total area flooded would only be 22,000 acres.

You also state that the Hydro have used higher unit prices inside cofferdams than the government engineers have used. No unit prices are given in their report, and though questioned at the public hearing in Ottawa re this matter, the Hydro officers displayed no knowledge of higher prices for excavation being used.

In your editorial, you draw attention to the fact that differences in estimated costs are to be expected in preliminary investigations, but it must also be noted that some expected differences are not found in the estimates shown in the Hydro report. For instance, when the height of the walls and lift of the lock above Morrisburg are increased by 20 ft., a large difference in cost would be expected, but it is not found. When the head of water retained by a power house at Barnhart Island is double that at Ogden Island, an increase in width of base would be expected, but no increase is shown in the plans filed with the Hydro report.

The plans and written report of the Hydro are in definite disagreement with regard to the position of power houses at Barnhart Island, the number of ice sluices to be installed, and the channel through the Long Sault Rapids. Though the Hydro gives no quantities, and though their estimates cannot be related to either plans or report, yet an error of \$3,000,000 is evident in tail race excavation at Barnhart Island alone. These obvious errors have all been

found on the side which reduced the cost of their scheme "B" and enlarged the cost of "A".

Since the government engineers have replied to the Hydro criticisms, the Hydro have withdrawn their regulation of Lake Ontario, and as much of their report was based on the supposed results of this regulation, there is little of a constructive nature left in their report to discuss.

Your repetition of the Hydro statement, that during an average winter there will be 9.2 square miles of open water between Prescott and Barnhart Island, 2.2 miles of which is said to be between Morrisburg and Barnhart Island, cannot be supported, at least with respect to that below Morrisburg.

Above Morrisburg, in winter weather, the swift water flowing through the Galop Rapids, and through the islands above Brockville, will always chill the water to the freezing point, and with low velocity, it will readily freeze over, as it now does on Lake St. Peter, Lake St. Louis and Lake St. Francis. The average velocity from Morrisburg to the Long Sault, under winter conditions, will be slightly less than it is now through Lake St. Francis, or from Maisonneuve to the foot of Lake St. Peter, and in these sections, ice covers have formed as early as December, and remained until April, in seven out of every ten winters of which we have record. In other years, it formed early in January, and moved out in March.

No objection can be taken to attaching great importance to flooding damages, and if the principle be adopted, for comparative purposes, that the value of lands be taken at three times their selling price, and the value of buildings at twice their cost to reproduce, no material change would be made in the relative advantage of the single-stage scheme over the double-stage scheme, but the flooding of Moulinette and Mille Roches, as contemplated in the Hydro scheme "B", would be shown to be unjustified.

As much power can be secured in the International section of the St. Lawrence by the Wooten-Bowden project, as by any two-stage scheme, at 20% less cost. Any two-stage scheme to be considered, must permit an ice cover above the Long Sault dam. To attempt to operate two power plants with 40 miles of open water, as proposed by the Hydro, must obviously involve huge losses of power and difficulties in operation.

GOOD ROADS ASSOCIATION TO MEET AT VICTORIA

VICTORIA will be the meeting place of the annual convention of the Canadian Good Roads Association, which will be held in June next. The final decision was taken at a meeting of the Executive of the association held in Toronto recently, at which the report of the committee delegated to visit the West was submitted. The tremendous growth of good roads sentiment, it is expected, will be manifested in the wide representation at the convention. So far official delegates from the Provinces of Quebec, New Brunswick, Nova Scotia and Ontario, including delegates from the principal cities of the East, have been delegated and representatives are expected from every section of the Dominion. Many new questions, dealing with highway construction and maintenance and increased Federal subsidies, will be dealt with by leading authorities on the various questions. Jointly with the convention will be held the second annual conference of Canadian highway officials and the annual convention of the Canadian Automobile Association.

Addressing the members of the Toronto branch of the Engineering Institute of Canada on March 9, Alfred Bicknell, of the legal firm of Bain, Bicknell, MacDonnel and Gordon spoke on the subject, "Some Legal Aspects of Engineering Problems." He pointed out that the establishment of a satisfactory contract afforded a means of avoiding legal difficulties which might otherwise be a source of trouble in engineering work. George T. Clarke, chairman of the Toronto branch of the Institute, presided.

MOTOR BUS TRANSPORT EXTENDING

RECENT surveys of the transportation situation on this continent show a steady extension of traffic by motor bus. In a considerable number of States of the American Union important progress has been made in this regard. An important and logical use for the motor bus has developed in co-operation with the electric railways, such, for example, as the linking up of two disconnected divisions of the Pacific North West Traction Co. over a distance of forty-four miles in the Puget District in the State of Washington. In Connecticut the street railways are also making important use of motor buses as auxiliaries, as is being done at the present time in the city of Toronto. It thus appears that the inception of motor bus service on Fifth Avenue, in New York, in 1906, initiated a most important development in vehicular transport.

Great progress has been made in transport by motor bus in Great Britain. A movement of portent is now under way in England and Scotland to obtain Parliamentary sanction for a number of the railways to engage in motor bus transport. They state that in the case of short haul traffic it would be cheaper and quicker for them to convey goods direct by the public highways than to utilize the railway trackage. Naturally much opposition is being offered by the existing motor bus and motor truck companies, but the logic of the position of the railways in the matter appears to be clear.

In this growing popularity of the motor bus, careful comparison must be made between it and electric railway as a transportation agency. Recent experience indicates that the electric railways are having a hard time of it.

It is said, for example, by Ralph M. Sparks, in a recent number of "Bus Transportation," that between 1915 and 1920 ninety-one electric railway companies operating 5,330 miles, or more than one-fifth of the total of electric railway mileage in the United States, went into receivership. In 1920 alone, over 628 miles of electric railway service was suspended and of this mileage 438 miles was permanently abandoned. In 1921 there were 118 miles of service suspended and 150 miles abandoned. Such conditions have made it extremely difficult for the electric railway companies to finance reconstruction work or rehabilitation of equipment. As compared with motor bus transportation, the electric railway is saddled with a large capital investment for track, power plant and distribution system. Approximately from 60 to 70% of electric railway investments are involved in such. It is to be expected, consequently, that the costs per car-mile will be greater than per bus-mile, but since electric cars have larger carrying capacity than buses the cost per passenger-mile by electric car for heavy traffic will be less than by bus. For light transport and for supplementary or feeder service the motor bus, however, appears to be more economical than the electric car. The experience of the London General Omnibus Co. is that for traffic one way per maximum hour up to 3,000, the motor bus is the best vehicle, whereas from 5,000 to 8,500 the street car is preferable to the motor bus. Recent figures on operating costs show that the one-man safety car gives a car-mile cost less than the cost per bus-mile, and consequently in a considerable number of cities the competition of motor buses has been met by one-man cars.

When all the factors of the situation are considered it thus appears that there is a distinctive field for both the motor bus and the electric car and that neither one will entirely displace the other as a transportation agency. It is the duty of those charged with responsibility in providing transportation in this country to discover the exact economic field for each of these forms of transport.

QUEBEC WATER POWERS AND THE UNITED STATES

IN A recent address Premier Taschereau of Quebec evidenced considerable alarm with respect to the possibilities of the United States obtaining some form of control over the water powers on the St. Lawrence river within the confines of the Province of Quebec. He is reported as having said:

"In other words, the Americans have at the most about 700,000 h.p. only, yet they are seeking to put under the jurisdiction of the International Joint Commission the whole 4,100,000 h.p. which they hope to put to their own uses. This is to say, again, that they are asking the Province of Quebec to alienate 2,700,000 h.p., or, it may be said to put this power under international control for the immediate and eventual benefit of our neighbors across the border."

An examination of the actual recommendations of the International Joint Commission indicates that there is no danger whatsoever of any foreign control being exercised over Quebec water powers. The Commission recommends, amongst other things, that "power works" be built, installed and operated by and at the expense of the country in which they are located. There is no shadow of indication that any international control is sought or contemplated for power developments within the Province of Quebec. Even in the case of "navigation works" located on this side of the international boundary maintenance and operation are to be entirely in the hands of Canada, there being merely the right of inspection conferred on the International Board so as to ensure economy and efficiency.

In view of the very definite stand taken by the International Joint Commission on the question of control, it seems remarkable that Premier Taschereau should have made a statement such as is credited to him in this regard.

PERSONALS

F. M. WADDELL, B.A.Sc., assistant engineer for Brant County, has passed his Ontario Land Surveyors' examination.

MERLE KERR has been appointed road superintendent and engineer for Stamford Township to succeed W. T. DALE, who has resigned.

WILLIAM STORRIE of Gore, Nasmith and Storrie consulting engineers, Toronto, has been elected chairman of the Toronto branch of the Engineering Institute of Canada.

R. E. N. BARRON, of Toronto, has joined the staff of the Walkerville Hydro-Electric system. Mr. Barron was formerly connected with the Eden Washing Machine Co., Toronto.

JOHN SEARS, Toronto, has been appointed as resident engineer at Chatham, Ont., for the Ontario Department of Public Highways, succeeding L. W. Wynne-Roberts, who has resigned.

C. R. HAGEN has been appointed chairman of the Welland Water Commission to succeed the late J. R. McCollum and HARVEY BEATTY elected to fill the vacancy on the Commission.

GEORGE STEPHENSON has been appointed engineer of Bruce County with office at Walkerton, Ont. Mr. Stephenson was born 27 years ago in Huron Township and is a graduate of Toronto University.

L. W. WYNNE-ROBERTS has resigned as resident engineer at Chatham, Ont., for the Ontario Department of Public Highways, in order to accept an appointment as manager of a branch office to be opened in Chatham by Frank Barber & Associates, Ltd., consulting engineers, Toronto.

OBITUARIES

W. E. GIBSON, a prominent retired contractor of Grimsby, Ont., died there on March 15, aged 49.

WILLIAM DALY, for some years a prominent contractor of Stratford, Ont., died in that city on March 13, aged 73. The deceased was born in West Nissouri Township and moved to Stratford forty years ago.

JAMES T. HALL of the city engineer's staff, Calgary, died in that city on March 3. Mr. Hall was born near Hamilton in 1851 and in 1880 he went to Portage La Prairie. He moved to Calgary in 1907 and superintended the erection of several large buildings. Subsequently he joined the city engineer's staff and in 1914 was placed in charge of the intake of the gravity water system.

SECOND UNIT AT QUEENSTON OPERATING

CONTRACTS for 25,000 h.p. have been cancelled by the Ontario Hydro-Electric Power Commission, now that the second unit at the Queenston power plant has been placed in operation, the new unit having a capacity of 55,000 h.p. When the unit is operating at full load, about the end of this month, further contracts will be cancelled. The third unit is being installed and it is expected will be in operation in about three months. The cancellation of contracts for the supply of power which will fully load both generating units of the Queenston-Chippawa Development will result in a revenue to the Commission of approximately \$2,000,000 per annum.

PROS AND CONS RE AMENDMENT TO ENGINEERING INSTITUTE BY-LAW

CERTAIN members of the Engineering Institute of Canada petitioned the Council of that organization last fall to make a change in By-law No. 52 whereby the retiring secretary-treasurer of any branch of the Institute would be an ex-officio member of the managing committee of the branch for a period of one year following his term of office.

This proposed amendment was discussed last January at the annual meeting of the Institute and it was decided to submit the matter to the members by letter ballot, and to mail with the ballot a memorandum stating the pros and cons. An editing committee was appointed to prepare a statement of the pros and cons.

This committee, comprising J. L. Busfield (representing the cons) and A. B. Lambe (for the pros), has rendered the following report:

Further to the petition forwarded on September 29 last asking for certain changes in By-Law No. 52, the undersigned, being the editing committee appointed by the Chairman at the last annual meeting of the Institute in compliance with and under the authority of By-Law No. 75, beg to submit the following set of pro and con reasons relating to the changes proposed:

PRO:

1—Complete continuity between the outgoing and incoming executive committees of every branch is obviously most desirable. The By-Laws of the Institute now provide for part continuity by providing that the retiring chairman shall be a member of the managing committee for one year following his term of office. It is submitted that in order to insure complete continuity it is necessary to have the official familiar with the branch records and its detail business, namely, the retiring secretary-treasurer, also a member.

2—Anything which is for the good of the branch is also for the good of the Institute as a whole. It is consequently submitted that if the change proposed be a help to the branch that it will also redound to the advantage of the Institute at large, and that it is therefore most desirable.

3—Certain branches already have this provision in their By-Laws which By-Laws have been passed upon and approved by Council before becoming effective. It is submitted that if Council permits such action on the part of some branches it surely cannot be argued that the practice is bad.

4—It is true that once in a great while such a regulation might prove to be undesirable because of an unsatisfactory official. It is submitted however that the general good should not be sacrificed for a rare and improbable exception.

5—As mentioned above, some branches already have the provision suggested in their By-Laws, but some have not. It is submitted that the uniformity which will be brought about if the suggested change be made is most desirable.

6—It has been suggested that it is not desirable to change the By-Laws unless really imperative, but a critical examination of By-Law No. 52 will show that its wording needs revision in any case because it calls for branches to be managed by a committee consisting either of "A chairman and a secretary-treasurer" or else "A secretary and a treasurer and other members." In the first case the committee consists of only two members and in the latter case no chairman is provided for. It is submitted that it is very obvious that neither arrangement is a good one nor the intent of the By-Laws.

7—Most branch secretaries are recruited from among the younger followers of the engineering profession. It is submitted that the proposed change will provide an opportunity, of which there are none too many as far as Institute offices are concerned, of recognizing the work and worth of its younger members.

8—Finally, it is submitted that the distinction at present obtaining between the retiring chairman and the retiring secretary is more or less invidious and that the change proposed is nothing but a righting of an undesirable condition and a compliment and acknowledgement of work done that is nothing but due to every retiring secretary, as is also the obvious due of every retiring chairman.

CON:

1—It might be found that the secretary-treasurer was not entirely desirable.

2—It is a matter for individual branch action.

(Signed) J. L. Busfield and A. B. Lambe, Committee.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Regina, Sask., erection of Chemistry Building	Mar. 31	Mar. 7
Essondale, B.C., erection of addition to hospital	Mar. 24	Feb. 28
Delhi, Ont., erection of addition to public school	Mar. 25	Mar. 14
Hamilton, Ont., erection of a Masonic Temple	Mar. 25	Mar. 14
Lethbridge, Alta., masonry construction	Mar. 30	Mar. 14
Morton, Man., gravelling of several roads	Mar. 25	Mar. 14
Ontario, Province of, supply of materials for Highway Department	Mar. 28	Mar. 14
Ottawa, Ont., electrical supplies	Mar. 24	Mar. 14
St. Catharines, Ont., road construction and material	Apr. 1	Mar. 14
Chippawa, Ont., construction of concrete intake structure and ship channel in Niagara River	Apr. 10	Mar. 14
Toronto, Ont., bituminous concrete pavement in Aurora and York Tps., for Toronto and York Roads Commission	Mar. 24	Mar. 14
Halifax, N.S., highway construction on Halifax-Yarmouth Road	Mar. 24	Mar. 14
Halifax, N.S., highway construction on Halifax-Amherst Road	Mar. 27	Mar. 14
Halifax, N.S., highway construction, Yarmouth-Shelbourne County line to Woods Harbor	Mar. 30	Mar. 14
Ontario, Province of, widening and deepening the channel of the Welland River and a portion of the Queenston-Chippawa power canal..	Apr. 10	Mar. 14

BRIDGES, ROADS AND STREETS

Birch Cliff, Ont.—The Township Council decided to construct sidewalks and improve the roads on Oakbridge, Warden Park and Bonnington Ave. Also a sidewalk on Kingston Road, from Stop 12 to Birchmont Road. Township Clerk, W. D. Annis, Scarboro.

Calgary, Alta.—The City Council passed the recommendation of the City Commissioners that the widening and improvement of Seventeenth Ave. west be undertaken at a cost of \$4,095. City Engineer, G. W. Craig.

Chatham, Ont.—The paving of Queen St. South will be undertaken by the Board of Works this year.

Chatham, Ont.—A special session of the Kent County Council has been called for March 23, when the question of good roads will be discussed and the program for the year will be mapped out.

Coleman, Alta.—A by-law authorizing the expenditure of \$5,000 for the construction of pavements will be submitted.

Durham, Ont.—The Town Council expects to start work this year on the construction of permanent roads. Gara-

fraxa St. will probably be the first street built. Town Clerk, Wm. B. Vollet.

Fredericton, N.B.—A delegation representative of the residents on the shore road between Musquash and Lepreau, presented a petition to the Government asking that that section of the highway be adopted as part of the trunk road between St. John and St. George, rather than the present trunk road which runs inland.

Hamilton, Ont.—The expenditure on suburban roadways will total about \$80,000 this year, according to a statement made by ex-Alderman Thompson, member of the suburban areas commission.

Hamilton, Ont.—Wentworth County Council instructed Road Superintendent T. R. Allison, Hamilton, to prepare an estimate of the cost of constructing a bituminous top road for the Brock and Binbrook roads.

London, Ont.—The proposed new Hyde Park overhead bridge will be erected here shortly, according to information received here from the Grand Trunk officials.

Manitoba, Province of.—The Provincial Government will be asked to authorize the building of four north and south roads as provincial highways throughout the western portion of Manitoba, as a result of a strong resolution passed at the annual meeting of the Brandon District Good Roads Association.

Mimico, Ont.—Permanent pavements will be laid this year in Eastbourne Crescent, Robert St. and Superior Ave.; also sidewalks on Pidgeon, Central and Robert Streets, Eastbourne Crescent and Queen's Ave. Town Clerk, J. A. Telfer.

Montreal, Que.—It is expected that construction work on the proposed \$3,000,000 highway through the Island of Montreal will be commenced this year. The thoroughfare will be 150 feet wide and will extend from the bridge terminal at Bout de l'Île to St. Anne de Bellevue.

Montreal, Que.—The proposal for a new bridge connecting the McGill street approach to the harbor with Victoria bridge basin, St. Helen's Island and the South Shore is strongly favored in the Montreal Harbor Commission's report for 1921, just issued by W. G. Ross, Farquhar Robertson and Brig.-Gen. A. E. Labelle, who were commissioners from 1913 to 1921 inclusive.

Montreal, Que.—The advocacy of another bridge across the St. Lawrence is becoming more and more general, and inside of a short time it is expected that the larger bodies of business men will go on record as being favorable. It was stated at the Chamber of Commerce recently. The Federal Government will be asked for a grant in order that a start may be made on the preliminary plans and specifications.

Newmarket, Ont.—The Town Council plans to construct permanent pavements on Prospect Ave., from Pearson St. to Huron St., and on Queen St., from Prospect Ave. to the G.T.R. bridge. Town Clerk, P. J. Anderson.

Ontario, Province of.—A petition addressed to the Minister of Public Works and Highways of Ontario is being circulated among the residents of Deseronto, East Hastings and North Prince Edward counties, asking that the Provincial Government construct and maintain a bridge over the Bay of Quinte to connect the Provincial County highway running from Deseronto to the ferry and from the ferry to Picton.

Ontario, Province of.—The Department of Highways awarded the contract for work to be done at the head of James St., Barton Township, to Roy Honsberger, at \$5,421. Other tenders submitted were: Barton Township Road

Superintendent, \$5,428; W. A. Taylor, \$5,428; F. H. Dickenson, \$6,750; Canadian Engineering and Contracting Co., \$7,089; Dufferin Construction Co., \$7,348; Canadian Engineering and Contracting Co., \$7,089; Dufferin Construction Co., \$7,348.50; W. H. Sheridan, \$13,440.

Ottawa, Ont.—The location of the proposed new bridge over the C.P.R. tracks on the Bowesville Road has been tentatively arranged. The bridge may be erected next summer or fall. Address Alan K. Hay, engineer of the Suburban Road Commission.

Owen Sound, Ont.—Grey County Council decided to go ahead shortly with the construction of the uncompleted portion of the county provincial road between Owen Sound and Meaford, a distance of seven miles. Road Superintendent, John Johnston, Owen Sound.

Ottawa, Ont.—The Ottawa Improvement Commission will probably complete the Experimental Farm Riverside Park driveway next summer. The Commission also plans the construction of bridges from the south shore of the Ottawa river to the three islands in the river. The canal road on the south side, from Bronson Ave. to Bank St., will also likely be finished this year.

Owen Sound, Ont.—The Suburban Area Commission will shortly hold a meeting to complete plans for the coming year's operations. There will be approximately \$50,000 spent on roads in this section this year, which will likely include several miles of concrete roads. The commission consists of C. H. Thompson, A. S. Donald, of Derby, and John Eaton, of St. Vincent.

Port Arthur, Ont.—The City Council has agreed to put into shape and to maintain the road to the Provincial Pulp and Paper Company's mill until such time as financial conditions warrant the construction of a subway or overhead bridge to cross the railway lines in the North End. City Engineer Antonissen informed the Council it would cost \$79,000 to construct an overhead bridge, approximately \$50,000 to complete a subway, and about \$1,500 to put the present road into shape.

Quebec, Que.—The Legislative Assembly passed the bill providing for an expenditure of \$7,500,000 this year on highway betterments.

St. John, N.B.—Council authorized Com. Frink to call for tenders for 175 tons of asphalt.

St. John, N.B.—A sketch blue-print of the steel and reinforced concrete viaduct designed by the C.P.R. for Douglass Ave. was submitted to the Council.

St. Thomas, Ont.—The plans and estimates in connection with the proposed underground work in Hiawatha St. have been approved by both the Provincial and Federal Departments of Public Works. The construction of an asphaltic-concrete pavement on this street will likely be started soon. City Engineer, W. C. Miller.

Sandwich, Ont.—The Town Council instructed the Town Engineer to prepare plans and specifications for the paving of Partington Ave., from London to Wyandotte Streets, and Chippawa St., from Sandwich St. to the Essex Terminal Railroad.

Saskatoon, Sask.—The construction of a bridge over the city park at a cost of \$2,500, is planned. City Clerk, Andrew Leslie.

Simcoe, Ont.—Norfolk County Council decided to raise \$100,000 to supplement the usual amount for highway construction.

Simcoe, Ont.—The Norfolk County Council instructed County Engineer G. R. Marston, of Simcoe, to prepare plans and call for tenders for the construction of tarvia penetration or concrete roadway, including grading and drainage, on a portion of the county highway north from Simcoe.

Stratford, Ont.—Mayor Gregory submitted to the City Council plans prepared by the Grand Trunk Engineering Department for the proposed bridge in Romeo Ward. Together with these plans, which showed sketches of subways and bridges at Well and King Streets, and a bridge at Front St., were figures of the estimated costs, ranging from \$26,000 for a 20-ft. bridge across Front St., to \$756,602 for a

40-ft. subway, 1,090 ft. in length at Well St. The plans and estimates were referred to the Committee of the Whole Council for consideration.

Tilbury, Ont.—Government surveyors are working between Tilbury and Chatham on the Provincial highway, which will be 86 ft. wide from end to end.

Toronto, Ont.—The extension of Riverside Ave from Carlaw Ave to Pape Ave., so as to make the Pape Ave. car line possible, was decided on by the Board of Control. Approximate cost, \$16,000.

Toronto, Ont.—The City Council and the Harbor Board will approach the Dominion Government with a view to securing an appropriation in next year's estimates for the construction of a bridge to Toronto Island.

Toronto, Ont.—The Edgewood and District Ratepayers' Association decided to approach the Civic Works Department regarding the paving of that portion of Edgewood Ave., near Kingston Road, which is a fill-in over Small's Pond. The association also appointed a committee to look into the matter of improving Ashland Ave., between Coxwell and Pullen.

Victoria, B.C.—Tenders for the railway portion of the Johnston Street bridge so far opened are about \$50,000 more than the estimates provide for, in spite of the fact that the price of steel has declined considerably since the estimate was prepared. It is probable that new tenders will be called for.

Victoria, B.C.—The Canadian Bridge Co. was the only firm that submitted a tender on the removal of the Esquimalt & Nanaimo steel railway span. The company will dismantle, remove and store the bridge for \$8,500, and for \$12,500 it will place the span at Rock Bay or some other suitable site on a substructure prepared by the city. The tender was referred to the City Engineer and Public Works Committee.

Windsor, Ont.—The Essex Border Utilities Commission contemplates widening Tecumseh road to 100 ft.

Windsor, Ont.—The Essex Border Highways Committee will spend \$607,000 in constructing and maintaining roads in Essex County this year.

WATER, SEWAGE AND REFUSE

Coleman, Alta.—The construction of a water works system to serve West Coleman is projected. A by-law will be submitted.

Galt, Ont.—Manager W. H. Fairchild, of the Public Utilities Commission, is preparing a report on a proposition to lay a water main across the river to feed the east side of the city.

Kitchener, Ont.—The contract for the electrical work in connection with the new pumping station on which work will start about the middle of April, has been let by the Water Commission to the Westinghouse Co. Contract for the crane has been let to the Herbert Morris Crane and Hoist Co., of Niagara Falls, Ont.

Long Branch, Ont.—A petition signed by practically all the residents will be presented to Etobicoke Township Council, urging the creation of a water area at Long Branch and the immediate installation of a water system.

Macoun, Sask.—Extensions to C.P.R. water supply mains at Macoun and Weyburn will be laid next summer, involving the construction of about three miles of new pipe line at the two points. Prices for cast iron pipe to be used in this work, and also tenders for the construction of the work, are being asked for by officials of the company in Winnipeg.

Mimico, Ont.—The Town Council passed a by-law providing for the raising of \$13,000 for the installation of an additional pump in the sewage pumping station. Town Clerk, J. A. Teller.

Mimico, Ont.—Sewers will be constructed this year on Elm St., Central St., Cavell Ave., Melrose Ave., Milton St., Algoma St., Dean St. and George St. Also water mains on Dean St., George St., Edith Ave., Central Mel-

rose Ave., Milton St. and Algoma St. Town Clerk, J. A. Telfer.

Niagara Falls, Ont.—The City Council passed a by-law for the construction of a sewer in the Pine Grove section. City Clerk, W. J. Seymour.

Niagara Falls, Ont.—The City Council intends to construct a sanitary sewer on Simcoe St., between Buckley Ave. and St. Lawrence Ave., at a cost of \$1,917.09. City Clerk, W. J. Seymour.

St. Thomas, Ont.—Application has been made for Government assistance in the construction of a sewer under the eastern section of Malakoff St. City Engineer, W. C. Miller.

Smith's Falls, Ont.—The Provincial Health Department is insisting upon the installation of a filtration plant in connection with the waterworks system.

Smith's Falls, Ont.—The Town Council has been served with a writ at the instance of the Provincial Board of Health, for non-compliance with an order for the installation of a filtration plant.

Swansea, Ont.—York Township's plans for installing a complete sewerage system here, were outlined at a recent meeting by Engineer R. O. Wynne-Roberts. If the Legislature passes the required legislation, work on the new sewerage system will likely be commenced next summer.

Toronto, Ont.—The Works Committee decided on the construction of a sanitary sewer on Cortleight Crescent.

Welland, Ont.—The Welland Water Commission is considering extending the water main on Major Street, east of Myrtle Ave.

Welland, Ont.—Members of the Welland Water Commission, after a conference with representatives from the Water Commissions of the municipalities of St. Catharines, Merritt and Thorold, decided that representatives from these municipalities should wait upon the Minister of Railways and Canals, at Ottawa, and lay before him the urgent need of constructing the proposed pipe line from Port Colborne to St. Catharines, by reason of the building of the Welland Ship Canal and diverting the waters of the Chippawa Creek thereto, thus polluting the source of supply of the various municipalities.

LIGHT, HEAT AND POWER

Brantford, Ont.—The governors of the General Hospital are considering the establishment of an auxiliary lighting plant.

Edmonton, Alta.—The supplying of Edmonton with power from an extensive coal area in this district is contained in an offer which A. E. Farncomb, surveyor and civil engineer, has submitted to the city council on behalf of himself and a number of associates. Delivery would be made at the city limits, as Edmonton has its own distribution system available. The city's proposal to submit a by-law for \$115,000 for improvements and additions to the power plant is ascribed as the reason for the offer.

Montreal, Que.—For some years past a corporation by the name of the Lachine Rapids Power Co. has been gathering data and preparing to finance a plan for the erection of a gigantic dam below the rapids to Heron Island in the St. Lawrence River, but the outbreak of the war prevented the action. It is rumored that efforts to put the scheme on its feet, through the reorganization and strengthening of the concern, are to be begun shortly. It is said that the work itself would cost in the neighborhood of \$175,000,000.

Montreal, Que.—In connection with the passing of the bills of the Montreal Service Corporation and Canadian Light and Power Co. by the Quebec Legislature, the statement is made here that the completed merger of these power interests will result in a capitalization of approximately \$100,000,000. With the powers now granted, the development of the Ottawa River at Carillon will be proceeded with as soon as weather conditions will permit, a considerable portion of preliminary work having been already accomplished. It is further claimed that the consolidation will finally result in the production of upwards of 300,000 h.p., much of which has already been contracted for. To carry

the work to completion a total of \$40,000,000 will be required, it is claimed, all of which will be expended during the next two years. The financial plans are well advanced.

Toronto, Ont.—Sir Adam Beck, Mayor Maguire and the local Hydro Commission met recently to discuss this year's program of capital expenditures by the city Hydro system, which calls for \$2,500,000. The chief subject of consideration was the new Hydro head office building at the corner of Front and Yonge Streets.

RAILWAYS

Montreal, Que.—At a recent meeting of representatives of the City Council and the Tramway's Commission, it was definitely decided to build a car line to the top of Mount Royal.

Toronto, Ont.—A formal application for \$13,000,000 for capital expenditure on the rehabilitation of the street railway was sent to the Mayor and Board of Control by the Transportation Commission. This amount is intended to cover this year's work, including the widening of the devil strip on 25 miles of track, and the replacement of sections of worn-out track in various parts of the city. It also includes provision for new car barns at Eglinton Ave. and an additional number of new cars.

Sheho, Sask.—The C.P.R. has sent out a survey party in connection with the construction of a railway northwest of Sheho.

FACTORIES AND LARGE BUILDINGS

Annapolis Royal, N.S.—The contract for the construction of a Town Hall was awarded to Allen & McGaw, of St. John, N.B., the price being \$15,985.

Blairmore, Alta.—The Provincial Government plans the erection of a court house and jail.

Brantford, Ont.—The Crown Electrical Manufacturing Co. plans to enlarge its plant. President, Joseph Ruddy.

Brantford, Ont.—The City Council will be asked to grant \$8,000 for the erection of an extension to the Collegiate Institute.

Bridgeburg, Ont.—New plans are being prepared for the proposed Town Hall. Instead of costing approximately \$30,000, the new building will cost \$42,000, according to latest estimates. Architect, C. M. Bortor.

Burlington, Ont.—The School Board accepted the bulk tender of the Pigott-Healey Co., Hamilton, for the construction of a High School, the amount of their tender being \$58,600.

Burns' Lake, B.C.—The Burns' Lake Hotel was destroyed by fire.

Calgary, Alta.—Tenders will be called at once for the erection of an educational building in connection with the Central Christian Church. Architect, D. S. McIlroy.

Copper Cliff, Ont.—The following contracts have been awarded in connection with the erection of a public school: General trades, Cecchetto & Knight, Copper Cliff; mechanical trades, Percy Morrison, Sudbury.

Glenboro, Man.—Contract for the erection of a school has been let to Crowe & Olafson, of Glenboro.

Hamilton, Ont.—A \$20,000 labor temple will be erected on Catharine St.

Hamilton, Ont.—A \$70,000 building is to be erected to be occupied exclusively by the medical profession.

Hamilton, Ont.—A permit has been issued to H. C. Gummo for the construction of brick and concrete buildings for the Hamilton Electric and Stereotype Co. at West Ave. and King William St. Cost, \$15,000.

Hamilton, Ont.—The ratepayers of West Hamilton empowered the trustees with authority to request the Anaster council to issue debentures amounting to \$40,000 for the purchase of a site and the erection of a school. Address W. Jarman.

Kingston, Ont.—The Provincial Government has decided to rebuild the Eastern Dairy School, according to an announcement made by Hon. Manning Doherty.

Kingston, Ont.—The Ontario Government has granted \$75,000 to Queen's University Library, which will make possible the commencement of work on the proposed new building this spring.

Kitchener, Ont.—The following contracts have been awarded in connection with the erection of a new building for Suddaby School: General contract, Casper Braun; heating and plumbing, Batter & Freiburger. Approximate total cost, \$160,000.

Leaside, Ont.—The construction of a four-room school is under consideration.

Leaside, Ont.—Durant Motors of Canada plan the immediate construction of a building, 80 by 600 ft. The Auto-Lite Co. plans to establish a plant here in conjunction with the Durant enterprise.

London, Ont.—The erection of a wholesale warehouse for James Cowan & Co., and a store for Cowan Hardware, Ltd., will be commenced at once by the executives of the D. J. Cowan estate. Each building will cost \$60,000.

Moncton, N.B.—The Minto Sample Rooms building was destroyed by fire. Owner, Carl Doull.

Moncton, N.B.—The Board of School Trustees will apply to the Provincial Legislature for authority to issue debentures to the amount of \$150,000, part of the amount to be used for the purchase of additional school lands, and for the erection and equipment of additional school buildings. Secretary, Amos O'Brien.

Montreal, Que.—A new Mount La Salle Tuberculosis Hospital is to be built in Maisonnette Park.

Montreal, Que.—The Private Bills Committee of the Quebec Legislative Council granted the city of Montreal power to borrow \$1,500,000 for the erection of a new City Hall.

Montreal, Que.—F. G. Robb has been appointed to prepare plans for a new engineering building for McGill University. K. G. Rea has been appointed as consulting architect.

Montreal, Que.—The two-storey brick building occupied by the Imprimerie de L'Est, at 144 Eighth Ave., Pointe Aux Trembles, was destroyed by fire recently, the loss being estimated at \$30,000.

Mount Dennis, Ont.—Mount Dennis Methodists have decided to erect a new church at Eglinton and Pearen Avenues, at a cost of \$35,000.

Niagara Falls, Ont.—Imperial Oil, Ltd., plans the erection of a gasoline station on the southwest corner of River Road and Bender Hill.

North Toronto, Ont.—The members of Eglinton Methodist Church plan the erection of a new building at a cost of \$60,000.

Oshawa, Ont.—In the near future work will commence on the new St. George's Memorial Church, which is to be erected on Centre St.

Oshawa, Ont.—The Town Council instructed the Oshawa Housing Commission to erect ten additional houses, making the program for this year twenty.

Oshawa, Ont.—A site has been selected on Mechanic St. for the construction of the arena by the Oshawa Arena Co. Plans of the proposed structure may be seen at the office of H. E. Smith.

Oshawa, Ont.—Instead of building a 16-roomed school on Centre St. as has been proposed, it is probable that two schools will be erected. If this plan is carried out, a 12-roomed school will be built on the Centre St. site and a smaller school will be erected in an outlying district.

Oshawa, Ont.—It is estimated to expend \$107,000 for general and high school purposes. In addition there is already before the council an application from the Board of Education for \$20,000 for a new 16-roomed school and administration building and \$20,000 for improvements on another school.

Oshawa, Ont.—W. E. Phillips, Ltd., has secured an option on the plant of the Thornton Rubber Co., which was recently gutted by fire. The new company plans to rebuild the plant and equip it with new machinery for the manufacture of woodwork, etc. It is understood that

Mayor Stacey's firm has been awarded the contract for the reconstruction of the building.

Ottawa, Ont.—An additional storey will be built to Lauder Hall.

Ottawa, Ont.—A large addition to cost about \$150,000 will be added to the University of Ottawa building this year. The plans have been completed and work will likely start within a month.

Ottawa, Ont.—The matter of completing the Victory Tower of the Parliament Buildings will be taken up immediately with Dr. J. H. King, Minister of Public Works, by John Pearson, Architect, of Toronto.

Ottawa, Ont.—Work will likely start within a month on the reconstruction of the Hotel Cecil, Sparks St. and the erection of a new hotel in connection with same, the total estimated cost of all construction being \$330,000.

Ottawa, Ont.—Either a 300-room hotel or a large theatre, either of which will cost approximately \$330,000, will likely be erected on the site formerly occupied by the Dominion Theatre. Further information from Grant P. Davidson.

Pembroke, Ont.—Tenders have been called for a school for the East Ward.

Pembroke, Ont.—The contract for the erection of a cottage hospital has been let to W. C. Keighley, Town Architect. The plans call for a building estimated to cost approximately \$100,000.

Peterborough, Ont.—The Western Clock Co. plan the erection of a factory at Hunter St. East and Armour Road, at a cost of \$80,000.

Preston, Ont.—The Board of Education has engaged F. W. Warren, of Hamilton, as architect for a new ward school to be erected next summer. Mr. Warren is also preparing plans for a large four-storey addition to the Hurlbut Shoe Company's plant at Preston.

Quebec, Que.—Plans for a school on Grant St., St. Roche's Ward, are being prepared by Emil Tanguay, architect, for the Catholic School Commissioners. Estimated cost, \$55,000.

St. Boniface, Man.—Fire destroyed the Lemontagne Block, the estimated loss being \$40,000.

St. Mary's, Ont.—The Collegiate Institute Board is asking the Town Council for \$18,000 for improvements to the building.

St. Thomas, Ont.—The proposed Technical and Vocational School for this city now has the unanimous backing of the financial committee of the city council.

Saltsfleet Tp., Ont.—The construction of a continuation school is projected.

Sarnia, Ont.—The erection of a \$75,000 arena next year is projected.

Sarnia, Ont.—T. H. Cook, chairman of the industrial committee of the City Council, has intimated the possibility of a grain-elevator for this port.

Summerland, B.C.—Fire destroyed the Bank of Montreal, office of the Review newspaper, postoffice building and the Empire Block.

Sussex, N.B.—The Grammar School, valued at \$65,000, was destroyed by fire recently.

Sydney, N.S.—Specifications and estimates for the proposed Cozzolino Hotel were submitted to a meeting of business men by Architect Dwyer, of Halifax. The cost of a 97-room hotel of fireproof construction would be \$280,000 and the cost of a similar structure, non-fireproof, would be \$244,000. The meeting decided to favor the former.

Toronto, Ont.—The Separate School Board will erect a school in Silverthorn district. Chairman, D. A. Carey.

Toronto, Ont.—Work has started on the erection of a \$65,000 veterans' clubhouse at the corner of College and Crawford Streets.

Toronto, Ont.—Fire damaged the building and contents of the Allen Manufacturing Co., Simcoe & Pearl Streets, to the extent of \$50,000.

Toronto, Ont.—Fire damaged the storehouses of the Kelley Flour & Feed Co., at 778-780 Dovercourt Road, to the extent of between \$8,000 and \$10,000.

Toronto, Ont.—Plans have been prepared for the erection by the city of a Fire Hall on the south side of Commissioners St. Estimated cost, \$40,000.

Toronto, Ont.—Controller W. W. Hiltz plans the erection of about twenty stores next summer in the Danforth Ave. district, at a cost of approximately \$250,000.

Toronto, Ont.—The members of St. Aidan's Anglican Church decided to proceed at once with the erection of a Memorial Hall at a cost of \$65,000. Rector, Rev. T. H. Cotton.

Toronto, Ont.—A permit has been issued to the Imperial Clothing Co. for the erection of a six-storey building at 355 to 359 Adelaide St. west. The estimated cost is \$60,000.

Toronto, Ont.—A new theatre to cost \$125,000 is to be built at the corner of Bloor St. and Beresford Ave. The theatre is to be built on property purchased through George B. Williams, real estate broker.

Toronto, Ont.—The members of Westminster Presbyterian Church have started a campaign for the raising of \$50,000 within a week with which to start building a new church on the site of the one destroyed by fire.

Thornhill, Ont.—The Trustee Board have awarded to William Riddell, of Thornhill, contract for building four-roomed school. James, Proctor & Redfern, Ltd., Architects and Engineers, 36 Toronto St., Toronto, are the architects.

Toronto, Ont.—Arrangements are being made for the erection of a large factory, planing mill and lumber yard on the Kennedy Road, south of the G.T.R. tracks. The plans include the building of a brick and concrete main factory, at a cost of \$60,000.

Toronto, Ont.—The Board of Education has awarded the following contracts: Hardware, Queen Victoria School, Canada Hardware Co., \$1,340; plastering, Island School, Andrew Petrie, \$645, electric wiring, Earls Court School, Canada Electric Co., \$71.

Toronto, Ont.—Plans and specifications for the completion of the addition to the High School of Commerce building were ordered by the Advisory Commercial Committee of the Board of Education. Chief Architect Dyson informed the committee that the original plans would be followed, with slight variations. Tenders will be called for the work.

Toronto, Ont.—Development operations on a large scale have commenced on the property of the late Sir William Gage, on the northwest corner of Bathurst St. and Davenport Road, which comprises about 22 acres, and of which A. F. Le Page has just secured control. The venture, which includes the erection of 60 houses, is estimated to cost well over \$1,000,000.

Toronto, Ont.—The executive committee of the Methodist General Board of Missions at a recent meeting voted \$25,080 for use of the Methodist Union of Toronto for church buildings in the suburbs of Toronto and vicinity; two sums of \$28,000 for new hospitals at the new Canadian mission centres at Hafford, Sask., and Vita, Man.; \$15,000 for the erection of a building at Sydney, C. B.; and \$9,000 for a building at Sault Ste. Marie, Ont. A resolution was passed urging the Federal Government to take action regarding the building of Indian Industrial institutions at Cognateeyza, B.C., and at Edmonton, Alta.

Truro, N.S.—A proposal to establish a public hospital here at a cost of \$80,000, was placed before the Town Council. The Council was asked to submit a by-law to the ratepayers authorizing an expenditure by the Town of \$10,000 towards the building fund. Address W. R. Campbell, vice-president, hospital trust.

Vancouver, B.C.—Senator S. J. Crowe has taken out a permit for a \$6,000 office building at 2902 Granville St.

Vancouver, B.C.—The United Cigar Stores, Ltd., intend to erect a two-storey building on Granville St., at a cost of \$35,000.

Vancouver, B.C.—Work will start about the end of April on the construction of separate schools in St. Patrick's parish. Address Rev. L. Forget.

Vancouver, B.C.—E. D. Farmer, of Fort Worth, Texas, will build a three-storey office building on the southwest corner of Granville St., work to start about May 1.

Walkerville, Ont.—A plan is under consideration to purchase a site on the Tecumseh road for the erection of a hospital.

Waterloo, B.C.—The Department of Education will likely erect a school here.

Walkerville, Ont.—The Walkerville Hydro-Electric Commission has chosen the drawing submitted by Harold McEvers, architect, as the best of 10 submitted for the erection of their new Executive and office building, and Mr. McEvers has been instructed by the commission to prepare working plans. The estimated cost of the building is about \$60,000.

Welland, Ont.—The City Council has approved of the erection of a Market Hall at a cost of \$15,000. City Clerk, W. E. Forster.

Weston, Ont.—The Board of Education plans the erection of an addition to the High School at a cost of \$115,000.

Weston, Ont.—A delegation will interview the post-master-general at Ottawa to urge the early erection of a post office here.

Weston, Ont.—G. H. Gray, Industrial Commissioner, reported to the Town Council that a large new industry is proposing to locate here.

Westmount, Que.—The erection of a new City Hall, Fire and Police Station is projected.

Windsor, Ont.—A permit has been issued for the erection of a new Windsor and Walkerville Technical School, on Giles Boulevard and Elsmore Ave., to cost \$689,000.

Windsor, Ont.—A new church site has been purchased by Bruce Avenue Baptist Church. Work on the erection of the church will be started shortly. Pastor, Rev. Owen C. Gray.

Windsor, Ont.—W. E. Wood & Co., contractors for the new technical school, have secured a permit to proceed with the construction of the building. The estimated cost is \$689,000.

Winnipeg, Man.—The Carter-Halls-Aldinger Co., Ltd., contractors for the erection of a four-storey addition to the Great West Life building, Lombard St., have agreed to have the work completed by October 1, at a cost of \$300,000.

York Tp., Ont.—The school trustees and ratepayers of School Section No. 26 decided to erect 12 additional rooms to the new building now in course of erection on Sannon Ave., at an estimated cost for building and equipment of \$185,000.

MISCELLANEOUS

Alberta, Province of.—The following companies have been granted Provincial charters: New Nakamun Coals, Gas and Petroleum, Ltd., Edmonton, \$2,000,000; Bell Metal Products, Ltd., Edmonton, \$50,000; Polar Aerated Water Works, Ltd., Calgary, \$35,000.

Hamilton, Ont.—The Board of Control approved of the following tenders for annual supplies being awarded: Grey iron castings, Hamilton Foundry Co., at \$2.93 per 100 lbs.; cast iron pipe at \$62 per ton, and special castings at 5 cents per lb., Gartshore-Thomson Pipe & Foundry Co.; extension boxes, Forwell Foundry Co., Kitchener, at \$2.85 each for the large size and \$2 each for the small size; limestone dust, Crushed Stone Co., Ltd., at \$6.90 per ton; crushed stone and screenings, the Canada Crushed Stone Co. and the Wentworth Quarry Co.; concrete sand, Armstrong Supply Co. and the Hamilton Sand and Gravel Co.; asphalt sand, the Sand and Supplies Co., Ltd.; sewer pipe and junctions, Hamilton and Toronto Sewer Pipe Co.; gate valves, the Kerr Engine Co. and Drummond McCall Co. The Tallman Brass Co. was awarded contracts for a good percentage of the total brass supplies. This firm will supply lead pipe at 9½ cents per lb., bronze and manganese hydrant casting at 23 cents per lb. and ordinary brass for the same purpose at 30 cents per lb. A contract was

A Weekly Paper for Civil Engineers and Contractors

Maryland Street Concrete Arch Bridge, Winnipeg

Two 150-Ft. Spandrel Filled Arch Spans — Careful Consideration of Aesthetics — Economically Superior to Open Spandrel Arches — Gravel and Crushed Rock Combined — Built in Halves to Maintain Traffic

BY. J. F. GREENE

Member of Firm of C. D. Howe & Co., Consulting Engineers, Winnipeg, Man.

PROVISION is made for traffic across the Assiniboine River between the business section and the best residential section of the city of Winnipeg in the new reinforced concrete arch bridge known as the Maryland Street bridge. The deck, consisting of a roadway 50 ft. wide and two side-walks each 7 ft. wide, provides for four lines of vehicular traffic including streets cars, with a maximum grade of 2%. While the structure, as a type of the standard barrel arch class of concrete bridge is not an object of special interest, the proportioning of the parts of this particular bridge to form a harmonious whole, and the mental processes involved in the proportioning may be of interest to

ous irregularities, due to the method of constructing concrete structures; each lift, or day's run of concrete is distinctly outlined in any exposed concrete surface; board marks have distinctive entities of different shades of gray, some dark, some light, due probably to the absorption capacities of the several boards; any yielding of forms, no matter how slight, results in offsets or waves; occasionally rock pockets appear which must be covered by disappointing patches. All such appearances are irregularities, and are displeasing to the eye. It is incumbent upon the designer so to proportion the major members of the structure as to make it pleasing and dignified, while at the same time

FIG. 1—COMPLETED MARYLAND ST. BRIDGE, WINNIPEG

those engaged in the solution of similar problems. A general view of the completed structure is shown in Fig. 1.

The determination of the number of spans was not left to the designers. While comparative estimates disclosed the fact that a three-span bridge was slightly cheaper than a two-span structure, and while aesthetic precedent would demand three spans rather than two, the Department of Public Works objected to the location of the south pier in the navigation channel and intimated that only a two-span bridge would be acceptable. The elevation of the crown of the south span was fixed as a result of the clearance set by the government for navigation purposes; hence the curves for the arches had been approximately predetermined, at least enough so to enable one to make preliminary sketches to ascertain how to treat most effectively the abutments, piers, spandrel walls and approaches.

Aesthetic Considerations

A slight digression upon the architectural limitations of concrete as applied to bridges, may not be amiss here. A concrete bridge presents all exposed faces of one color, a dull monotonous gray. These faces in turn disclose vari-

so to accentuate the minor members by the use of pilasters, inserts and grooves as to withdraw the attention from the essential defects of concrete surfaces.

It has been assumed as axiomatic that the dimensions and proportions of the several parts should be indicative of the service which each part contributes to the stability of the whole. The abutments, marking clearly the river banks and the limits of the arch spans, should appear to the observer as of sufficient mass to withstand successfully the horizontal thrust from the adjacent arch span. The pier, while of sufficient mass to carry the vertical loads transmitted from the arches, should present faces so proportioned as to offer the least obstruction to the passage of ice and water.

Preliminary Studies

With these limitations and axioms in mind, preliminary sketches were made. In one sketch an excessive use of horizontal lines, and in another an equally excessive use of vertical lines, disclosed the basis of the proper treatment for this structure. The structure outlined appeared to be squatly, this quality being exaggerated by the excessive

use of horizontal lines and relieved greatly by the appearance of vertical lines. Proceeding from the assumption that the structure lacked depth, abutments and piers were increased in height to a level above that of the handrails; the surfaces were relieved with deep vertical grooves, and even the form boards were placed vertically to further the illusion of depth. The spandrel wall surfaces were broken up by pilasters which in turn were exaggerated by inserts at both edges to accentuate vertical shadow lines, contributing thereby to the depth illusion.

To conceal the results of yielding forms and outline of each day's run, grooves were left in the concrete at regular intervals, both in the arches and in the walls; with each day's run ending in a groove, the line of the joint was concealed and in addition the grooves themselves gave shadow lines which tended to relieve the monotony of the large flat gray surfaces.

In proportioning the exposed portions of the side-walk slabs and brackets, it was expedient to exceed the structural requirements of the design, lest the parts should appear too light for stability. By breaking the sloping side faces of brackets into several vertical faces, an illusion of breadth and strength was produced and the impression which would have resulted from the monotonous succession of plain brackets altered to a definite and pleasing one.

Aesthetic Treatment of Deck

This completes the consideration of the proportioning of these parts of the structure, which should appear to observers standing either upstream or downstream from the

have been set high enough on the poles to eliminate dangerous shadows from passing cars.

Principal Structural Characteristics

A consideration of the structural features may now be in order. The adoption of a solid barrel, earth filled arch, rather than an open, spandrel, reinforced, concrete deck bridge, rested primarily upon economic grounds and secondarily upon structural considerations. With an average fill of 10 ft. the earth fill arch showed a saving of 25% under an open spandrel arch; on the approaches the saving was greater, since the increase in the cost of the deck was not offset by reduction in the substructure due to reduced dead loads. Further, the earth fill type, exposed only at the intrados, is less subject to movement and cracking due to extreme temperature changes than the open spandrel type. In addition the solid barrel type offered greater mass and at the same time less obstruction to the passage of ice.

In the design of the approach retaining walls, a radical departure from standard practice was made in that the foundations for these walls were carried down through more than 20 ft. of excavation, and bonded into the rock. This unusual treatment was due to exceptional conditions at the site. Just east of the north end of the bridge, the Cornish baths had given evidence of a strong tendency to move toward the river, and a few hundred feet west of the bridge, several apartment blocks had actually moved and tilted; one section of one of these blocks had been condemned and demolished. The evidence was clear that the bank was not stable and that structures resting on this bank

FIG. 2—DETAILS OF ARCH RIBS AND SPANDREL WALLS

bridge. The treatment of the deck of the bridge presented a separate and a different problem. Smooth, easy approaches from connecting streets with the least possible grades attainable were desiderata. The elimination, or failing this, the subordination of all trolley and light poles on the deck of the bridge, was adopted as a policy which should be pressed consistently. The design of the hand-rail, the outstanding portion of the structure visible from the deck, remains. Since the observer views the handrail, not from a distance, as he views the arches, piers, and abutments, but at close range, the appeal to the imagination lies not so much in the tout ensemble, the grouping of the parts into a well balanced whole, as in the excellence of the parts themselves, the intricacy of the fabric and the quality of the texture. Hence it is essential that special methods of handling the concrete should be adopted so that the surface irregularities of commercial concrete, such as air holes, water holes, and form marks, would be eliminated. This may be accomplished in various ways, either by the dry process, or with sand moulds, or by scrubbing the surface of green concrete with steel brushes to expose a specially prepared color aggregate. On the Maryland bridge the third method was adopted; the colored aggregate consisting of red granite, crushed to pass a $\frac{3}{4}$ -in. screen, was exposed by scrubbing with steel brushes and cleaned by several washings of muriatic acid and water.

The illumination has been provided through the medium of four-light clusters, set on combination light and trolley poles, standing in the devil strip and located about 90 ft. apart. Each light is diffused by wide angle Holophone Refractors which reduce the glare materially; and the lights

would be equally unstable; hence the reason for the unusual foundations for these approach walls.

Assumed Loadings

Each arch was designed for a maximum live load of four 50-ton cars with an additional impact allowance of 20%. The arches have been so proportioned that under all conditions of loading the line of resistance lies within the middle third, resulting in a maximum compression of 453 lb. per sq. in. The maximum for combined live load, dead load, rib shortening, and a temperature drop of 60 deg. is 652 lb. per sq. in. and for a temperature drop of 60 deg., the maximum combined stress is 750 lb. per sq. in. For tensile stresses due to rib shortening and temperature, steel reinforcement has been provided. Details of the arch ribs and spandrel walls are shown in Fig. 2. In general, 1-in. rods were lapped 5 ft. at splices and $\frac{3}{4}$ -in. rods were lapped 4 ft.

The structure rests upon solid rock foundations. The abutments were designed with the line of resistance within the middle third and with a maximum pressure upon the rock of $9\frac{1}{4}$ tons per sq. ft. The rock was excavated to a depth of 6 ft. to provide additional resistance to sliding. The maximum bearing pressure from the pier upon the rock is 11 tons.

The spandrel walls were designed as cantilevers resting upon the arches, the moment from the side-walk brackets being transmitted through counterforts to the arch ribs. Expansion joints at the haunches provide for lateral movement resulting from the fall of the arches due to a drop in temperature, and at the third points expansion joints

predetermine the cracks resulting from the rise of the arches due to a rise in temperature. All joints have been projected to the handrails and appear to be working satisfactorily; those at the junctions of the handrails with the piers and abutments have opened approximately $\frac{3}{4}$ in. at this writing. All joints in the walls and side-walks have

FIG. 3—EAST HALF OF BRIDGE UNDER CONSTRUCTION

been sealed by folded strips of sheet lead to prevent the escape of water through the joints with the attendant discoloration of the concrete.

Proportioning of Concrete

The proportioning of the concrete itself remains for consideration. The engineering department had been instructed to use the gravel and rock provided by the Greater Winnipeg Water District at a price of \$3.85 per cu. yd. for gravel supplied during the winter, \$2.00 per cu. yd. for gravel furnished during the summer, and \$4.00 per cu. yd. for crushed rock. The problem, stated simply, was to determine the economical proportions of cement, sand, rock, and water, combined to form concrete, which would give an assured compressive stress of 2250 lb. per sq. in. at 28 days, i.e., three times the maximum stress in the arches. Preliminary investigations disclosed the fact that there were wide variations in the physical characteristics of different samples of gravel from the same pit. Tests of the gravel showed that the weights per cubic foot varied from 98 to 115 lb., and the percentage of coarse retained on a $\frac{3}{4}$ -in. screen varied from 21% to 48%. Two series of tests were carried out, each embracing the making, and breaking in the testing machine of 60 cylinders 6 in. in diameter and 12 in. long. In the first series, the lighter coarser gravel, weighing approximately 100 lb. per cu. ft. was used. The materials were combined in one group to make one part of cement to six parts of the aggregate, such as 1:1½:4½, 1:2:4, 1:3:3, 1:3½:2½ and 1:4:2; and in another group to make 1:7½, such as 1:2:5½, 1:2½:5, 1:3:4½, 1:3½:4.

In the second series, while similar proportions were used, the gravel itself was more dense, weighing approximately 114 lb. per cu. ft. While no mechanical slump test for consistency was employed, the amount of water used was the least consistent with proper workability. The percentages of water for the first series varied from 6 to 8% by weight of the cement and aggregate, and the water cement ratio was from 0.58 to 0.86 by volume; for the second series the percentage of water varied from 7% to 9%, and the water cement ratio from 0.76 to 1.05.

Compression tests at 28 days showed that cylinders of the first series were approximately 22% stronger than cylinders of the second series composed of the same proportions by volume. Since prudence would dictate that we should base our decision upon the tests of the weaker of the two series, we concluded that the most economical combination from which we might expect to get concrete of the desired compressive strength was 1 part of cement to 3 of gravel to 2½ of crushed rock; while the best results for

the foundation concrete containing five sacks of cement to the yard were obtained with a combination of 1 of cement to 4 of gravel to 2 of rock. Complete records of the properties of the ingredients and of the concrete, were prepared and filed for reference.

Tests of Actual Concrete Used

In order to obtain assurance that the concrete in the structure was of the quality anticipated as a result of the tests, sample cylinders made of the concrete actually placed, were taken daily and tested at 28 days. The concrete placed in the substructure, containing 5 sacks of cement per yard, was very dry, of a consistency such that it would just quake under tramping. The average of the tests run during the months of February, March and April for this class of concrete was 2100 lb. per sq. in. at 28 days. The concrete in the approach walls, containing six sacks of cement per yard, was wetter than the foundation concrete, but with only enough water to permit spading and consolidating the mass in the thin walls. The average of the tests for the class of concrete placed during May and June was 2300 lb. per sq. in. The concrete in the arches containing six sacks of cement per yard was of a consistency such that it would not flow, while at the same time containing sufficient water so that it would quake upon being worked up. The average of the tests for the concrete in the arches at 28 days was approximately 2800 lb. per sq. in. The importance of keeping the water content of the concrete at a minimum consistent with workability was emphasized and impressed upon the construction organization, with the result that we were able to obtain a result which more than equalled our anticipations. The increase in strength from 2300 to 2800 lb. per sq. in. for concrete with the same combinations of solids but of different consistencies, is significant.

The proportioning of the handrail was the result of cut and trial methods, sample slabs having been prepared of different combinations of the aggregates; these samples, after having been scrubbed and washed, were placed side by side and compared. The proportion adopted was 1 cement to 2½ broken red granite to 1 granite dust to 1½ torpedo sand.

Construction Methods

The construction methods adopted for this work involved no spectacular operations. The prescribed task was the construction of the new bridge with a minimum of interference with the dense traffic over the steel bridge, the centre line of which was west of the new bridge with the floors of the old and new bridges overlapping.

FIG. 4—WEST HALF OF BRIDGE UNDER CONSTRUCTION—OLD STEEL BRIDGE REMOVED

The substructure of the abutments and pier were constructed as units; the superstructure, including arches, walls, side-walks, and fill, was constructed in two parts, the east half of the bridge having been completed and thrown open for traffic before the wrecking of the steel bridge, and the commencement of construction upon the west half. This

plan was adopted on the ground of economy, and because operations might be conducted under this method with the least interference with traffic. Figs. 3 and 4 show the construction of the east and west halves respectively.

The excavation of the abutments began in December, was carried out with the usual derrick and skip or bucket equipment and was expensive owing to the cold weather. In preparing the foundations for the pier, an orange peel was used to remove a surface layer of rocks and boulders; a line of Wakefield sheet piling was driven from leads suspended from a derrick boom; this piling was backed by a puddle, the combination affording an adequate water-seal whereby the water was kept down within the dam with a single centrifugal pump. In excavations for the abutments and approach walls, sufficient water was encountered to necessitate the continuous operation of pumps.

The concrete plant for the foundations included a paving mixer with a side-loading hopper for which extension leads had been prepared. In concreting the pier, this mixer was placed on cribbing at an elevation high enough to permit of dumping direct from the mixer to the pier; the cement, gravel and rock, placed in the loading hopper with wheelbarrows at ground level, were elevated to the mixer over the extension leads. In concreting the abutments, the mixer was placed on the ground near the edge of the excavation, the aggregate placed in the side loader with wheelbarrows, and the concrete conveyed through chutes to place.

The water and aggregate for concrete placed during the cold weather were heated; the spaces containing concrete were housed and heated for a considerable period after the placing of the concrete; every effort was made to give the concrete the advantage of being cured under conditions approaching normal.

Arches and spandrels were painted with a waterproof paint to increase their imperviousness.

Concrete Plant

The concrete plant for the superstructure consisted of a bin into which sand and rock were loaded from a bucket elevator, drawing from pits into which gravel and rock had been dumped, from heavy automobile trucks. This plant was so located in the west half of the north approach that it was possible to complete all concrete work without interference from the plant.

The concrete dumped from the mixer into side dump cars was drawn to place over a light wooden trestle by a small gasoline dinky, the engine for which had been taken from the mixer. In placing the concrete for the side-walk and spandrel walls, concrete buggies were drawn to place by the dinky on flat cars made in part of the trucks from the side-dump cars. The plant was cheap, eminently satisfactory, and the results were excellent.

The falsework was conventional, except perhaps, in the method employed to obtain the arch curve. In place of the standard practice of cutting the curves from the stringers, wedges and waste blocks and planks were added to build up the curves on plain stringers. Under this method much lumber otherwise worthless was used, and the stringers of new stock were available after use in a condition as good as that of new lumber.

Cinders for the fill were accumulated in an adjacent vacant lot during the first half of the year. These cinders were loaded into dump cars with a light electric Thew shovel and hauled to place on the bridge.

Construction began in December, 1920; the east half of the bridge was thrown open for traffic in August, the west half in November, and the street car traffic commenced on December 1, 1921.

The contract for the construction was awarded to the City Engineer, W. P. Brereton, on a competitive basis, at a price of \$250,000, and the bridge has been completed well within the contract price. The project was carried out with A. L. Cavanagh as superintendent; Allan Colman, chief draftman, and J. F. Green as consulting engineer.

SASKATCHEWAN ENGINEERS HOLD MEETING

AT THE annual meeting of the Saskatchewan branch of the Engineering Institute of Canada held at Regina recently, it was decided to hold meetings at Saskatoon during the year for the benefit of the members resident in the northern part of the province. The convention was well attended and the election of officers resulted as follows: Chairman, J. R. C. Macredie, Moose Jaw, district engineer for the C.P.R.; vice-chairman, C. W. Dill, Regina, superintendent of highways for the Saskatchewan Government; new members elected to the executive, R. N. Blackburn, Lieut.-Col. A. C. Garner and A. P. Linton, all of Regina; secretary-treasurer, re-elected, D. A. R. McCannel, city engineer, Regina. With the above the following old members complete the executive for the ensuing year: Prof. C. J. McKenzie, Saskatoon; J. W. Calder, Swift Current; G. W. Green, Moose Jaw.

The retiring chairman, W. R. Warren of the Saskatchewan Department of Telephones, gave a brief address, dealing with details in connection with the betterment of the institute and expressing thanks to the officers and members for their co-operation during the past year.

Votes of thanks and expressions of appreciation of the services rendered by the retiring officers and members of the executive were expressed. The three retiring members of the executive are H. M. Weir, Saskatoon; Lieut.-Col. A. J. McPherson, Regina, and C. W. Dill, Regina.

Speaking at the banquet held in the evening, Mr. Macredie expressed his appreciation of the honor conferred upon him by his election as chairman and briefly dealt with the past development and future prospects of the association. Mr. Dill also spoke briefly and in the course of his remarks pointed out the splendid opportunities which the future afforded to young men entering the profession, especially in view of the probable impetus which would be given the development of the natural resources as soon as they are turned over to the province for administration.

That building costs have been stabilized for at least one year, following negotiations conducted during the past few weeks by a special committee representing the various contracting and building concerns in Vancouver, B.C., was the announcement made at the conclusion of a meeting held recently by the General Contractors and Master Builders' Association of Vancouver. A comprehensive report covering the negotiations was submitted by the special committee, in which it was stated that with a condition of stability now assured the outlook for building this season is of the brightest.

Urging the necessity of a provincial good roads association, H. C. Carpenter, Deputy Minister of Highways for Saskatchewan, emphasized the educational value and said that such an organization must include all classes in the province. The importance of including the association of rural municipalities especially was mentioned, because its members spent more money on roads than the highways branch itself. In 1919 the department spent \$1,200,000; the rural municipalities \$2,100,000. In 1920 the department spent \$1,600,000; the municipalities \$2,800,000. In 1921 the department spent \$2,300,000. The figures for the rural municipalities for last year were not yet available, but would be in excess of the highways expenditures.

Recommendations contained in the report of the County Highways Committee that \$607,000 be spent this year in constructing and maintaining roads in Essex County, have been approved by the Essex County Council. Although the work will be financed by the county, \$293,000 will be provided by the province, leaving the county ratepayers to pay \$314,000. Only \$200,000 of the total amount can be raised by debenture issues, which means that \$107,000 will be paid this year in taxes.

WATER POWER RESOURCES OF CANADA

Review of Water Power Development—Power Utilized in Central Station and Pulp and Paper Industries—Many Water Powers Not Yet Developed

By J. T. Johnston,

Chief Engineer, Dominion Water Power Branch, Ottawa.

PRESENT activity in hydro power development warrants a further statement as to the extent of Canada's water power resources and as to the degree of their utilization. Last year has been one of substantial progress, there having been brought into operation new installation to the extent of 300,000 h.p. The installed water wheel capacity now totals to 2,763,000 h.p. with much new construction actually under way and many further enterprises in prospect.

During the past two years there has been under way in the Dominion Water Power Branch a careful re-analysis and computation of the water power resources of the Dominion. All existing stream flow and power data, available from Federal and Provincial sources, have been systematically collated, analyzed and co-ordinated with a view to preparing on a uniform basis from coast to coast, revised estimates of the power available. While the analysis is not yet finally completed, sufficient progress has been made to warrant the publication of the figures given herein.

The total available and developed power resources are presented in a manner not heretofore adopted. A consideration of the figures will indicate that they place the water power resources of the Dominion in a much more favorable light than have previously published compilations.

While the resources have been exhaustively analysed in so far as the information available will permit, it should be kept in mind that only very meagre data is to hand in many districts and for many rivers.

Basis of Computation

The figures for undeveloped water power listed in Table 1 are based upon rapids, falls and power sites of which the actual existent drop or the head possible of concentration, is definitely known or at least well established. Many rapids and falls of greater or lesser power capacity are scattered on rivers and streams from coast to coast which are not as yet recorded, and which will only become available for tabulation as more detailed survey work is undertaken and completed. This is particularly true in the more unexplored northern districts. Nor is any consideration given to the power concentrations which are feasible on rivers and streams of gradual gradient, where economic heads may be created by the construction of power dams, excepting only at such points as definite studies have been carried out and the results made matters of record.

In brief, the figures hereunder are based on definite rapids, falls and power sites, and may be said to represent the minimum water power possibilities of the Dominion.

The power estimates have been calculated on the basis of 24-hour power at 80% efficiency on the basis of "Ordinary Minimum Flow" and "Estimated Flow for Maximum Development." The "Ordinary Minimum Flow" is based on the averages of the minimum flow for the lowest two consecutive seven-day periods in each year, over the period for water records are available. The "Estimated Flow for Maximum Development" is based upon the continuous power indicated by the flow of the stream for six months in the year. The actual method to determine this flow is to arrange the months of the year according to the day of the lowest flow in each. The lowest of the six high months is taken as the basic month. The average flow of the lowest seven consecutive days in this month determines the maximum for that year. The average of such maximum figures for all years in the period for which data are available is the estimated maximum used in the calculation.

This estimated maximum development is based upon the assumption that it is good commercial practice to de-

velop wheel installation up to an amount, the continuance of which can be assured during six months of the year, on the assumption that the deficiency in power during the remainder of the year can be profitably provided from storage or by the installation of fuel power plants as auxiliaries. The correctness or otherwise of this assumption for any particular site can only be definitely settled by the careful consideration of all circumstances and conditions pertinent to its development. The method, however, enables us to make a fairly satisfactory over-all estimate of the maximum hydraulic power available, as distinctive from the estimated ordinary minimum power available.

The recorded power available throughout the Dominion, under conditions of ordinary minimum flow and within the limitations set out in the foregoing, is 18,255,000 h.p. The water power available under estimated flow for maximum development, i.e., dependable for at least six months of the year, is 32,076,000 h.p. (For details see Table 1).

TABLE 1
Available and Developed Water Power in Canada

Province	Available 24-hr. power at 80% efficiency.		Turbine installation h.p.
	At ordinary min. flow h.p.	At est. flow for max. dev. (depend- able for 6 mos.) h.p.	
1	2	3	4
British Columbia	1,931,142	5,103,460	305,315
Alberta	475,281	1,137,505	33,187
Saskatchewan	513,481	1,087,756	
Manitoba	3,270,491	5,769,444	104,147
Ontario	4,950,300	6,808,190	1,212,650
Quebec	6,915,244	11,640,052	1,015,385
New Brunswick	50,406	120,807	30,180
Nova Scotia	20,751	128,264	46,948
Prince Edward Is....	3,000	5,270	1,869
Yukon & Northwest Territories	125,220	275,250	13,199
	18,255,316	32,075,998	2,762,880

The figures listed in columns 2 and 3 in the above table represent 24-hr. power and are based upon rapids, falls and power sites of which the actual existent drop or the head possible of concentration, is definitely known or at least well established. Innumerable rapids and falls of greater or lesser power capacity are scattered on rivers and streams from coast to coast which are not as yet recorded, and which will only become available for tabulation as more detailed survey work is undertaken and completed. This is particularly true in the more unexplored northern districts. Nor is any consideration given to the power concentrations which are feasible on rivers and streams of gradual gradient, where economic heads may be created by the construction of power dams, excepting only at such points as definite studies have been carried out and the results made matters of record.

The figures in column 4 represent the actual water wheels installed throughout the Dominion. These figures should not be placed in direct comparison with the available power figures in columns 2 and 3 for the purpose of deducing therefrom the percentage of the available water power resources developed to date. The actual water wheel installation throughout the Dominion averages 30% greater than corresponding maximum available power figures calculated as in column 3. The figures quoted above therefore indicate that the at present recorded water power resources of the Dominion will permit of a turbine installation of 41,700,000 h.p. In other words, the present turbine installation represents only 6.6 per cent of the present recorded water power resources.

The above figures may be said to represent the minimum water power possibilities of the Dominion.

As illustrative of this the detailed analyses which have been made of the water power resources of the province of New Brunswick and Nova Scotia have disclosed most advantageous reservoir facilities for regulating stream flow and it is estimated that the two provinces possess within their respective borders 200,000 and 300,000 commercial horse power. These figures provide for a diversity factor between installed power and consumers' demands.

There are installed to date throughout the Dominion water wheels and turbines to the extent of 2,763,000 h.p. However, it would not be correct to place this figure in direct comparison with the minimum or maximum available power figures quoted above and therefrom deduce the percentage of the available water power resources developed to date. An allowance must be made for the average ratio between the water wheels installed and the power available.

An analysis of the water power plants scattered from coast to coast, concerning which complete information is available as to turbine installation and satisfactory information as to stream flow, gives an average machine installation 30% greater than the six month flow maximum power. Applying this, the figures quoted above therefore indicate that the at present recorded water power resources of the Dominion will permit of a turbine installation of 41,700,000 h.p. In other words the present turbine installation represents only 6.6 per cent of the present recorded water power resources.

Progress During Past Year

During the year 1921 the readjustment of values following war time inflation made substantial progress. This readjustment necessarily brought in its train many business and financial difficulties and the lack of confidence in trading circles generally led to a reluctance of capital to embark upon new enterprises. Employment fell off with a corresponding diminution in popular purchasing power and in consequence there has been a general tendency to mark time while readjustment advances the further step which will bring costs within the reach of the normal spending power of the community both individual and corporate.

The hydro-electric industry though naturally affected by the general depression suffered no set back and in fact the horse power installed during 1921, 300,000 h.p., stamps it as one of the most progressive years in Canadian water power history.

The progress of development is somewhat difficult to follow from year to year because the year is too short an interval. From three to five years or even longer often elapses between the first consideration of development and the delivery of power. Again most projects commence with an initial installation much less than the ultimate projected capacity and new units of machinery are installed from time to time as the load develops. In other words, what we may call the scoring column often does not reflect new construction for some years after such construction has been actively under way, but continues to record new scores from old developments.

The 300,000 h.p. installation during 1921 is made up of both kinds of growth and in addition a considerable amount of new construction was initiated which ensures that as old power plants reach their ultimate capacity new ones will take their place in maintaining the continued growth and prosperity of Canadian hydro-electric enterprise.

Developed Water Power in Canada

The 2,763,000 h.p. at present installed throughout the Dominion is apportioned to the following uses: (See Table 2).

2,013,000 h.p. in central electric stations for general distribution purposes, such as operation of street railways, operation of mines, operation of electro-chemical and electro-metallurgical industries, operation of pulp and paper mills and for general industrial and domestic use.

476,000 h.p. installed in pulp and paper mills. In addition there is used in the pulp and paper industry 161,000 h.p. purchased from the central electric station installations.

274,000 h.p. installed in industries other than central electric stations and pulp and paper mills.

The total installation for the Dominion averages 315 h.p. per thousand population, a figure which places Canada second only to Norway in the per capita utilization of water power among the countries of the world.

Water Power in Central Station Industry

By far the most important use to which the development of water power has been applied in Canada has been in connection with the central electric station industry. The extensive economic radius of modern electrical transmission, combined with the fortunate location of water power in relation to centres of industry, has resulted in the widespread development of the Dominion's water power resources through central electric stations. The extent of this industry and the important relationship which water power bears to it may be measured by the fact that 91% of the prime motive power is water power and that there is now invested some \$437,000,000 in hydro-electric plants and systems engaged in the production of electrical energy for sale and distribution.

Throughout the Dominion there are 282 hydro-electric stations with an installed turbine capacity of 2,013,000 h.p. or a generator installation of 1,701,000 k.v.a. (See Table 3). It is of interest to note that of the total turbine capacity, 1,449,000 h.p. is installed in commercial or privately owned stations while 564,000 h.p. is installed in municipal or publicly owned stations.

The units vary in size from 10 h.p. to the 60,000-h.p. turbines just installed in the Queenston development of the Ontario Hydro-Electric Power Commission and which are to date the largest turbines anywhere installed. The turbine units in the industry average 3,077 h.p. while the average installation of the central stations is 7,137 h.p.

Continued and systematic progress is being made in the further development of the industry; new units are being installed, new plants constructed and new projects investigated having in view the necessity for meeting the growing domestic and industrial demand for cheap hydro-electric energy.

Water Power in the Pulp and Paper Industry

The manner in which water power has influenced and assisted in the development of the pulp and paper industry throughout the Dominion is demonstrated by the power statistics of that industry.

Cheap motive power is almost as important to the production of pulp and paper as is the abundant supply of raw material. The importance of cheap power lies in the fact that it takes practically 100 h.p. to make a ton of paper per day. It is not therefore surprising that motive power used in this industry is practically restricted to hydraulic energy and that Canada's premier position in the pulp and paper field rests on adequate and abundant water powers well distributed among extensive forest reserves.

Throughout the Dominion 113 mills, operated by water power, are engaged in the manufacture of pulp and paper, using in all, hydro energy to the extent of 637,000 h.p. (See Table 1). This total is made up of 476,000 h.p. actually installed in pulp and paper mills plus 161,000 h.p. purchased by pulp and paper mills from central electric stations which derive their energy from water power.

The development of the electric drive in the pulp and paper industry has been marked in recent years. Its advantage lies in an assured uniform speed of operation and in the fact that it permits the centralized operation of a large mill receiving power from several hydro-electric sources. This means the economic location of pulp and paper mills having due regard for source of pulpwood supply, source of power supply and availability for shipping product. Of the 476,000 h.p. actually installed in pulp and paper mills, 179,000 h.p. is represented by hydro-electric drive. To this amount may be added the 161,000 h.p. of hydro-electric energy purchased from central electric stations, bringing the total electric drive up to 340,000 h.p.

TABLE 2.—DEVELOPED WATER POWER IN CANADA

Turbine Installation in H.P.

Province.	In Central Stations	In Pulp and Paper Mills	In Other Industries	Per 1000 Population	Total
1	2	3	4	5	6
British Columbia	207,656	48,800	48,859	305,315	584
Alberta	32,380		807	33,187	87
Saskatchewan					
Manitoba	93,355		10,792	104,147	170
Ontario	948,372	170,624	93,654	1,212,650	414
Quebec	696,593	224,412	94,380	1,015,385	432
New Brunswick	8,978	14,668	6,534	30,180	78
Nova Scotia	14,992	17,999	13,957	46,948	90
Prince Edward Is.	245		1,624	1,869	21
Yukon	10,000		3,199	13,199	3,170
Canada	2,012,571	476,503	273,806	2,762,880	315

Column 2 includes only hydro-electric stations which develop power for sale.

Column 3 includes only water power actually developed by pulp and paper companies. In addition to this total, pulp and paper companies purchase from the hydro power central stations totalled in column 2, 72,122 h.p. in Ontario and 88,455 h.p. in Quebec. The total hydro power utilized in the pulp and paper industry is therefore 637,080 h.p.

Column 4 includes only water power actually developed in connection with industries other than the central station and the pulp and paper industries. These industries also purchase blocks of power from the central stations totalled in column 2.

Column 5 totals all turbines and water wheels installed in Canada.

Column 6 averages the developed water power per 1000 population.

TABLE 3.—DEVELOPED WATER POWER IN CANADA UTILIZED IN THE GENERAL ELECTRIC STATION INDUSTRY

Province	Commercial Stations			Municipal Stations			Total			
	Installation			Installation			Installation			
	No.	Generator K.V.A.	Turbine H.P.	No.	Generator K.V.A.	Turbine H.P.	No.	Generator K.V.A.	H.P. per turbine Unit	Total Turbine H.P.

Commercial Stations include all privately owned.

Municipal Stations include all publically owned.

NOTE—Statistics in this table are based upon a Census of the Industry made by the Dominion Bureau of Statistics in co-operation with the Dominion Water Power Branch.

TABLE 4.—DEVELOPED WATER POWER IN CANADA UTILIZED IN THE PULP AND PAPER INDUSTRY

Installed and Purchased Power: H.P.

Province	No. of Mills.	Turbine Installation in the Industry			Purchased Hydro-Electric Power	Total Hydro- Electric Col. 4 & Col. 6	Total Utilized in the Industry Col. 5 & Col. 6
		Direct	Drive	Total			
1	2	3	4	5	6	7	8
British Columbia	5	27,975	20,325	48,800		20,825	48,800
Ontario	41	89,430	81,194	170,624	72,122	153,316	242,746
Quebec	54	159,900	64,512	224,412	88,455	152,967	312,867
New Brunswick	3	2,368	12,300	14,668		12,300	14,668
Nova Scotia	10	17,919	80	17,999		80	17,999
Canada	113	297,592	178,911	476,503	160,577	339,488	637,080

Column 2 includes all turbines actually installed in the industry and directly driving mill equipment.

Column 4 includes all turbines actually installed in the industry and transmitting power through electric drive.

Column 5 totals the turbine capacity actually installed in the industry.

Column 6 includes only power purchased from hydro-electric central stations for the operation of pulp and paper mills.

Column 7 totals the hydro-electric power used in the industry. Column 8 totals the water power used in the industry.

Of the total installation listed, 5 mills are located in British Columbia utilizing 48,000 h.p., 41 in Ontario utilizing 242,700 h.p., 54 in Quebec utilizing 312,900 h.p., 3 in New Brunswick utilizing 41,700 h.p., 10 in Nova Scotia utilizing 18,000 h.p.

The systematic progress during the past few years in the pulp and paper industry is an indication of the rapid expansion which may be expected in the future.

Future Growth in Utilization of Water Power

It is profitable to consider the history of water power utilization in Canada during the past few years in conjunction with the present activity with a view to making some reasonable forecast as to its probable future growth. Should the rate of water wheel installation during the past fifteen years be maintained, there will be installed in 1925, 3,360,000 h.p.; in 1930, 4,110,000 h.p.; in 1935, 4,860,000 h.p. and in 1940, 5,600,000 h.p. In view of the increasing appreciation of the advantages of hydro power combined with the fortunate location of ample supplies within easy transmission distance of practically every great industrial centre throughout the Dominion, there is every reason to anticipate that this rate of growth in utilization will be accelerated rather than retarded. Reference to the foregoing totals of water power available will indicate that this anticipated increase in utilization will not seriously reduce the total reserves. Canada possesses sufficient reserves of water power to meet all anticipated demands for many years to come.

In order to ensure the most beneficial utilization of these reserves and to provide intelligent guidance for their development, two essentials are required:

1st: An accurate knowledge of the location, capacity and the engineering and economic possibilities of development of the water powers throughout the Dominion, together with their relationship to other natural resources of mine and forest, to industrial centres and opportunities, to transportation systems—rail and navigation, to coal and fuel supplies, to irrigation, drainage and reclamation projects, to alternative sources of power and to market for and uses of power in general.

2nd: A sound governmental administrative policy designed to protect the public from inadvisable and ill-designed power schemes and to provide for reasonable regulation and revision of rates and rentals, and at the same time to ensure satisfactory guarantees for the encouragement of legitimate investment in hydro power enterprises.

True conservation of our water power resources, which are inexhaustible through use, lies, not in withholding them from development, but in their efficient utilization in the public interest for the economic exploitation of our other natural resources, and for the conservation of our exhaustible fuel supplies.

The water power now developed in Canada represents an investment of \$530,000,000. In 1940 should the rate of growth of installation during the past 15 years be continued, this investment will have grown to over \$1,000,000,000. The present development represents an annual equivalent of 20,500,000 tons of coal which, valued at \$8 per ton, represents \$164,000,000. In the year 1940 these annual figures will, with the foregoing assumption, have become 42,000,000 tons and \$336,000,000. These figures are striking evidence of the outstanding importance and necessity of an intelligent administrative policy governing the development of our water power resources.

AGENTS FOR IRVING IRON WORKS

ANNOUNCEMENT is made of the appointment of the Standard Steel Construction Co., Welland, Ont., as sole Canadian representatives for the sale of the products of the Irving Iron Works, New York City, consisting of steel floor-gratings and "Safesteps." Irving floor gratings have been used almost exclusively in the subway work in New York and vicinity.

CHILEAN RAILWAYS TO BE ELECTRIFIED

AN IMPORTANT contract was recently awarded to the Westinghouse International Co., by the Chilean Government for the electrification of the first zone of the Government steam railways. This contract which is one of the largest and important single orders received by any firm on this Continent will amount to \$7,000,000 and will include electrification of 146 miles of road, 39 locomotives and five sub-stations.

The total railroad mileage of Chile is 5,200, of which about 30 per cent is privately owned mainly for mining and industrial enterprises. The remainder of the mileage is divided into two general classes, the broad gauge lines and the narrow gauge lines. The former extend South from Valparaiso by way of Santiago to Puerto Montt, with numerous branches, while the latter comprise most of the northern roads with a few branch lines in the South.

The initial electrification will include 116 miles from Valparaiso to Santiago, and 28 miles from Las Vegas to Los Andes. Los Andes is the terminus of the Transandine Railroad, a narrow gauge line, while the narrow gauge longitudinal railroad runs north from Calera, an important station on the line to be electrified. The line contains a relatively large number of curves, the maximum being 10 deg. The track gauge is 5 ft. 6 in. There are six tunnels on the main line, the longest, the San Pedro, being 1600 ft. in length. Three of the tunnels are located on the most severe grade approaching the Summit.

Long Transmission System

The 300-volt direct-current system was decided upon as best suited to the conditions. Hydro-electric power will be generated at the Maitines Station of the Chilean Electric Tramway Line Co. This station is already under construction and will utilize the waters of the Rio Colorado. The station will contain three 8125-kva Westinghouse generators and will have an ultimate capacity of 30,000 kw. This power will be transmitted 37 miles to Santiago by twin circuit 110,000-volt transmission lines and will be generated at 50 cycles, 3-phase. These transmission lines will be connected at Santiago with the system fed by the Florida hydro-electric station and the Mapocho steam station, both of which were constructed some years ago by the Germans and were designed for 50-cycle 3-phase power. The total capacity of the three generating systems at present proposed will be, when completed, approximately 120,000 kw.

The power supply will be distributed by five sub-stations designed to handle a train movement that is approximately 50 per cent greater than that existing in 1917, with a further provision for tripling the 1917 traffic demands, if necessary. Each station will initially contain two Westinghouse 2000-kw. motor generator sets, each set consisting of a 2300-h.p. driving motor, and two 1000-kw. 1500-volt generators connected in series. These sets will be designed to withstand a 200 per cent overload for five minutes without injury, and as an additional safeguard the dash suppressor which the Westinghouse Co. has developed, will be included.

Sub-stations Nos. 1 and 5 will receive power at 12,000 volts, while Nos. 2, 3 and 4 will receive power at 44,000 volts. Transformers and switching equipment will be of the Westinghouse latest design and the Westinghouse developed power indicating and limiting equipment will be installed.

Thirty-nine electric locomotives are required for the initial electrification, including 6 express passenger, 11 local passenger, 15 road freight and 7 switching locomotives. All locomotives will be equipped with Westinghouse motors. The express passenger and road freight locomotives will be equipped with the Westinghouse system of regenerative braking, with the most modern development. The service in which the local passenger locomotives will operate will not require or justify the regenerative braking feature.

HOW SHOULD PROVINCIAL HIGHWAYS BE FINANCED?*

Distribution of Responsibility — Who Should Pay For the Highways? How Should They Be Paid For?

By F. H. Richardson,
Warden of Ontario County.

THE determination of the location of the provincial highways in Ontario was governed largely by our urban centres and their requirements as to transportation. That was practically the sole force that determined the location in this province and was only affected by a consideration of the tourist traffic which has become very important to the province. So far as the requirements of purely rural districts or the wishes of the rural districts in this province were concerned they did not affect the location of one mile of provincial highway. When we consider the matter of the main highways of this province in regard to transportation there is no doubt the proper considerations were given as to the locations of these. When you come to our rural districts and consider their road requirements, they call for market roads, roads to the station and roads to the village which are of great importance. Comparing the mileage of provincial highways with the tremendous road mileage of the province, there are only a few farmers who will use the provincial highways in the general run of their business.

Channels of Transportation

On the other hand the provincial highways have become an important factor in extending communication between our urban centres. There is no question that the main highways such as the county, county-provincial and provincial, have become through the motor traffic, the important channels of transportation of this province, and cannot be considered in the same category as a city street or the concessions and sideroads in rural districts. And there is no doubt the up-keep develops upon the cities, upon the counties and upon the province; the only question is the equitable distribution of the responsibility. Some of these roads have been under the control of the province, some under the county councils and some under what are known as Suburban Area Commissions. We have heard the argument that because the province has taken over certain roads as provincial highways therefore the province should undertake the entire cost. The same argument can be used in a suburban area, that because the Suburban Commission has taken over a certain road therefore that district should carry the entire up-keep, and so with county roads. There is no logic in this argument and to my mind it is nothing more or less than subterfuge to evade responsibility.

I did not intend to take much time referring to the dozens or hundreds of deputations that waited upon the Provincial Government to urge that certain highways should be designated as provincial highways. There is no question that they would be a great advantage to the people who were pleading that these roads be made provincial highways but not to the other fellow. Now then you find these cities and districts through which the highways run asking to be relieved of the responsibility, to say the very least, it is unfair to the other part of the province, and certainly is against that principle of taxation which from time immemorial has been recognized as just, namely that the districts or communities that receive the benefits should pay. Now I think our county road system helps us to decide who should pay for these provincial highways. We can all remember the advent of motor cars and the condition of our main highways throughout this province. The Provincial Government for the purpose of improving and taking care of condi-

tions recommended the county road system which was started by our urban centres. The rural districts were loathe to take hold at first, however we have that system.

How Roads are Financed in Ontario County

The province aids and the towns in the counties pay the same toward these county roads as the rural districts; the county councils may vote on roads that are connecting links in the towns a certain amount to help the town out. It works out in the County of Ontario in this way: Since we adopted the county road system we have assessed our county for road rates to the extent of two mills. We have been giving back to our towns half a mill. The towns in the County of Ontario appreciate the object of the highway legislation, that is, that the urban centres should recognize and help in keeping up these main highways and I might say that the towns in the County of Ontario have always been pleased with that condition. The Town of Oshawa pays one-seventh of the cost of the good roads in the County of Ontario and we reach up to the Muskoka district.

When you come to the cities they do not pay towards the county road but towards the suburban area comprising provincial highways and other selected roads. If the cities could evade their responsibility towards the provincial highways you would find a few cities in the province doing so and not commencing to help to keep up the good roads the same as their neighbors in the towns throughout the province. For the cities to evade their responsibility would destroy the fabric of the good roads movement by which we all hope to have good roads in this province.

We must not forget that two or three years ago there was great opposition to the provincial highways because they only ran along the north shores of Lake Ontario and Lake Erie, and the great mass of the people of Ontario were not receiving any benefit. Even today although they have been extended four times their length yet it must be apparent to everybody, for the districts enjoying the advantages of these highways to evade or have their responsibility cancelled, would result in one or two things. You would create great opposition to the provincial highways on the one hand or on the other you would have all the counties in Ontario clamoring to have their highways made provincial highways in order to evade responsibility.

A provincial highway running through a county is the main highway of that county, and there is no question that it will draw to it a great deal of traffic, thereby relieving other highways in the country and thus relieving our local municipalities and other counties of considerable cost. We do not want to blind ourselves to the fact that the construction of roads costs money and an organization, whether county or city council, who wants roads, can only get them by dealing fairly with one another.

Viewpoint of Province

Let us look at the other side of it, that of the province. We must not forget that the obligation of the province is tremendous, that the amount of money that they are spending on the roads is a source of considerable criticism, political and otherwise, not only in the government but throughout the province. The province gave to counties and suburban areas last year somewhere in the neighborhood of \$5,000,000, without taking care at all of the expenditure on the provincial highways. When we consider their source of revenue for this purpose, namely, motor vehicles, 20% assessment on cities and counties, and the grant from the Federal Government, we know that the balance of the money must come from the consolidated revenue fund of the province and we all know that the taxes are up to the limit for that purpose. There is no doubt the province has gone their limit and if they were to concede to the cities their request it would create an injustice between urban and rural centres in the building of highways in the province. There is too much made out of the opposition to the cost of provincial highways. We in the County of Ontario have taken this position: We have recognized that the construction of the provincial highway is of a per-

*From paper read at Twentieth Annual Meeting of Ontario Good Roads Association, March 2.

manent nature and when the road is built, the future cost will only be that of maintenance and a burden to nobody; therefore, our county considered it was only fair and just that we should issue bonds to help us carry over the 15-year period, with the result that it is not costing the taxpayer of the County of Ontario any more to construct the provincial highway than any other of their system of roadways, and the people of our county are satisfied and pleased with the work that has been going on.

Toronto Not Helping Provincial Highways

I would like to take this opportunity of dealing with this question so far as it applies to the City of Toronto. The force that created the agitation for the building of the Toronto-Hamilton Highway in the first place emanated from the city of Toronto. Then Hamilton took hold of it and they worked on it and pleaded for it until they got the municipalities between here and Hamilton to arrange to build it. Legislation was passed to carry out the construction of that highway. At the same time the city of Toronto came down to the district to the East and agreed to pay 30% of the cost of a similar road to meet their requirements between Toronto and Oshawa, however, this did not materialize as road building then took an impetus throughout the Province of Ontario and an agitation took place for Provincial Highways. So the outcome of the work of the city of Toronto gave rise in reality to what is known as our Provincial Highway system today. In that the city of Toronto recognized her responsibility, recognized the necessity of these improvements for herself, she went out pleading for them and had a perfect right so to do. The provincial highway legislation today, is on the same basis only more favorable to the city, more favorable to the counties than the basis on which you of the city of Toronto strove to build the Toronto-Hamilton Highway and on which the proposed road between Toronto and Oshawa was to be built. I want to place before the people of Toronto that by their acts they recognized the justice of the provincial highway legislation so far as their responsibility is concerned; they recognized the necessity of this work. Now I want to say further the city of Toronto today is not a party to the provincial highway system, although she is paying on the suburban area. Toronto probably enjoys this position of isolation. Toronto is the only big city, I believe she is the only city in the Province of Ontario, that is not helping so far as the provincial highways are concerned. She is doing less than any town in the province. This is unfair, and I want to say this to the Minister of Public Works and the City of Toronto that we in the suburban area have something to say and if this question is not quickly settled we will get together and have something to say in what Toronto's responsibilities are and they shall be carried out.

The country needs all kinds of transportation, and transportation means prosperity not only to the city but to the rural districts as well. You can have no prosperous rural district without transportation and the City of Toronto must be connected up with the finest system of transportation she can get to gain the greatest benefit. I believe the province is being fair with the local districts. They are getting the provincial highways for 20% and I believe our advantage is equal to that and we should not try to evade it; we should not hamper the province in its good work so far as roads are concerned.

ROAD BUILDING IN THE U. S.

FEDERAL road construction in the United States during 1922 will expand in every section of the country as a result of the amount of money made available by the Federal Government and because of the conditions of reasonably cheap materials and plentiful labor. At the beginning of this year an additional \$73,125,000 was set aside as federal aid to highway construction, all of which, according to the stipulations accompanying this grant to the various state governments, must be expended by June 30, 1924, while the balance of the previous aid grants must be expended before June 30, 1923.

New York State's total apportionment under the new act is \$3,696,447, of which \$2,464,000 became available at the beginning of the year. Under the old acts, New York has been allotted \$13,688,801, which, with the appropriation under the new act, makes a total of \$17,385,249 which the United States will have contributed to the State's system of highways. Texas, on account of her area and mileage or rural and state routes, receives a total of \$20,000,000.

Six Million Tied Up

Of the \$13,688,801 allotted to New York, more than \$6,000,000 is tied up in completed work or highways under construction, more than \$7,000,000 is available for new construction, only \$3,000,000 is in entirely completed work, and \$1,189,523 had been earned by the State. Until five years ago the Federal Government took no hand in road construction. Today half the roads being built are being aided by the United States.

What the new legislation will mean to the country can be judged by the way in which the \$275,000,000 previously appropriated has been spent. Practically \$200,000,000 had been put to work up to the time the last report was completed, and to match this the States appropriated a total of \$265,000,000, making a grand total of \$465,391,000. The total mileage of roads involved was 28,000.

Restrict Heavy Loads

Officials of the Bureau of Public Roads of the Agriculture Department say that next to construction of roads the prime problem is to work out regulations for the use of unusually large trucks because of the wear and tear they impose. One way to solve the problem, they say, is to restrict their use to certain highways designed to accommodate them. Another way would be to strengthen all roads, and the third to prohibit the use of these trucks entirely.

For the security of the enormous investment which is being made by the States and Federal Government, it is imperative that this question of the duty which the roads will be called upon to render in the future shall be definitely determined. A clearer conception of the relative economy of heavy and light vehicles will be gained by careful study.

The bureau is now making investigations to determine accurately the load carrying capability of various kinds of roads, of various thicknesses upon different kinds of subsoils, and the variance of traffic in different localities. In one State it is claimed that the return from the roads in reduction of transportation costs and development of territory undoubtedly has compensated for the loss resulting from their destruction by the trucks.

In line with its recent action in opening branch offices at Raleigh, N.C., with Harry P. Grier in charge, and at Atlanta, Ga., with James R. Valk in charge, the Asphalt Association, New York City, J. E. Pennybacker, secretary, carrying out its policy of expansion, has moved its Canadian office from Toronto to Albany, N.Y., where Germain P. Graham, formerly deputy city engineer of Albany, will be in charge as district engineer. Mr. Graham will not only look after the Asphalt Association's interests in Canada but will travel the state of New York, assisting street and road engineers and contractors wherever necessary, in solving such problems as they may encounter in asphalt work. This service will be rendered to counties and municipalities free of charge. Mr. Graham graduated from Rensselaer Polytechnic Institute in 1908 as a civil engineer. From 1909 to 1917 he was in the city engineer's office at Albany where he had charge of individual construction jobs such as the river front improvement and the field work in connection with the intercepting sewer. During the World War he served as Captain and Adjutant in the Twentieth Engineers, and after the signing of the Armistice was put in charge of road repair work in Southern France. At the conclusion of his army service he returned to Albany as deputy city engineer.

ASSESSMENT FOR BENEFIT*

Highway Construction Improves Value of Property — Assessments Should Be Increased — Plea for Legislation to Encourage Proper Assessment

By K. W. McKay,
Clerk of Elgin County, Ontario.

IN THE development of the highway laws of the Province of Ontario every care has been taken to provide for the equalization of benefit and expense; to provide roads for everyone to use, and to equalize the expense as far as possible, that was the trend of the legislation. It has been said that we derive a great deal of benefit by the increase in property values due to good roads, and dealing with that phase of the matter I want to direct your attention to two very simple matters that county councillors and their officers are overlooking every year. One of these matters relates to the assessing of property along, or contiguous to an improved highway. A few years ago a friend of mine who had a market garden on the Toronto-Hamilton Highway of 40 acres that he had purchased for \$8,000, was able to sell it after the highway was constructed for \$40,000, making a profit of \$32,000, and he is able to live in comfort now.

A year or two ago we investigated the effect that an improved highway had on the assessment of property, and we found that along the Toronto-Hamilton Highway there was no appreciable increase in assessment and in some cases the assessment had been decreased. That in itself would suggest that municipal officers were not doing their duty in that particular township. No one will deny but that there is an added benefit by the building of an improved highway, and that added benefit should be considered by the assessor; if that is not done there is a considerable discrimination in favor of the property along the improved highway, and it has the effect of making the man in the back part of the township, furthest away from the improved highway, make the same contribution in township taxes. I think the township council should bring matters of that kind to the attention of their assessors. It is just possible that the owners of property along these improved roads are influential men, and that is all the more reason why they should be made to pay on the improved values of their property.

Province Should Appoint Inspector of Assessment

That is one way in which township councils can, under the present law, encourage assessment for benefit. The next way in which that can be done is in the county council. We all know that the county councils equalize the assessments annually, and when the valuers are being appointed there is generally considerable wire pulling and log rolling before their report is adopted. I would suggest that in the future the county councils should consider the location of improved highways in making their equalized assessment, and see that the township values are increased in cases where there are improved highways, unless that is done it is difficult to get a proper contribution. It is well enough to direct attention to a matter of that kind, but in order to have a law of that kind enforced, it will be necessary to have additional legislation and that additional legislation should be with the view of encouraging proper assessment of all lands along improved highways. My suggestion is that the province should appoint an inspector of assessments along improved roads and that the duty of such an inspector should be to see that the added values are properly assessed.

The bill prepared for consideration in 1916 provided for a system of assessment for benefit, and that engineers should go over the property and determine what increase in value had been added to each property by the building of the highway, and make a report similar to the report that is made under the Drainage Act; the township council to

constitute a Court of Revision for the adjustment of the benefit as determined by the engineers' report. The question of the amount the property along the improved highway should be charged is another matter.

Provision on Provincial Highways

In the construction of provincial highways the law provides that the county shall pay 20% of the cost, and I think the same thing should apply in connection with county and provincial county roads; that the municipalities through which they are constructed should pay 20% of the cost and that the township should assess a portion of that against the land fronting on the highway. The principle of charging the county 20% for provincial highways is I think a proper one. There always comes a day of settlement and in the end the people have to pay.

In some counties they are having difficulties in meeting the wishes of the people who live along suburban area roads, and in connection with provincial highways through police villages. In localities like that they generally want a wide road, the ratepayers are all in favor of the wider highway and they would like to do the work on the local improvement plan, a police village is part of the township and the local improvement act does not apply and I think it should be amended so as to cover cases of this kind. I think the further consideration of all these matters should be referred to a small commission who could report fully.

Toronto-Hamilton Highway Case Cited

A short time ago there were some expropriation proceedings in connection with the Toronto-Hamilton highway, and the department appealed from the decision of the arbitrators, claiming that the property derived a great deal of benefit from the work as a whole and that that should be set off against the damage; the department is of the opinion that there is a large added value and how to arrive at that added value should be something for the commission to consider. I believe that in all matters of highway construction whether county, provincial or township, that where it is necessary to expropriate property the township or county authorities should be allowed to act immediately, the same as the provincial authorities can act and take possession of the property immediately and leave the assessment of damage if any to be settled afterwards.

We hear a great deal about private approaches; I do not think the same idea is applied in any two counties. I have given a good deal of attention to this matter and while we may not agree on the question it is perhaps well to understand what some people may think of it. Our county road superintendent had some difficulties in convincing the ratepayers that the old box culverts that he had taken out in front of farm gates should not be put in again by the county. He had been advised that the county was not liable and in order to get a clear and distinct reason for his action he submitted the whole question to the county solicitor who advised him that the county was only liable when the damage to the property as a whole was greater than the benefit that property derived from the work.

I think that is all I can say at the present time with reference to assessment for benefit except to suggest that a commission be appointed to consider the whole question and have a proper report laid before this association or the legislature at the next session and I think such a report would surprise you as to the condition of affairs at the present time.

In the discussion which followed, Daniel Quinlan, treasurer of County Simcoe endorsed the remarks made by Mr. McKay. In many of the counties of the province, particularly the smaller ones there may be direct benefit derived by every ratepayer in the county from the provincial highway, but in some of the larger counties, particularly where the provincial highway does not run through the centre of the county there is no very great benefit to a majority of the ratepayers. In the County of Simcoe a large part of the ratepayers receive no benefit from the provin-

*Paper read at Twentieth Annual Meeting of the Ontario Good Roads Association, Toronto, March 2.

cial highway. We have 30 municipalities and I venture to say that more than 50% of the ratepayers live more than 20 miles from the provincial highway, and some of them live 30 and 40 miles away from it.

SOME ASPECTS OF ONTARIO GOOD ROADS MOVEMENT*

Defends Large Expenditure—Good Construction Record in Ontario—Importance of Township and County Roads—Statute Labor Being Eliminated

By W. A. McLean

Deputy Minister, Ontario Dept. of Public Highways.

THERE are a few features of our work which appeal to me very pointedly and which I would like to discuss. One is that I have not at any time been able to see the unanimous opinion that the time was ripe to pay for the construction of good roads. Everybody wants good roads but there is always a fear that they should be called upon to pay for them. So long as I see the enormous waste going on throughout the country, I have no fear whatever that insolvency will be created through the construction of good roads. Enormous sums are spent for pleasure, a great deal more than we are spending for the construction of good roads. Fire alone in the Province of Ontario consumes as much almost as we are spending on good roads. Waste is going on in every direction, and if we could sum up these wastes we would be appalled. When men tell me that we are going to handicap ourselves by the construction of good roads I say he has a wrong view, otherwise the country would have disappeared long ago. It is astonishing the amount of waste the country can stand; it is impossible to explain it, but when we go ahead on real construction, creating assets of a permanent nature and of real value within reasonable limits of cost, we are on absolutely safe ground.

Three Departments of Highway System

We have divided our highway construction into three parts, township roads, county roads and provincial highways. We are apt to give too much prominence, I think, to the provincial highway system. It is something new, and it is for a short time absorbing a large expenditure; but it after all is only one department of our highway system, all the others are equally important, and I have been very much in sympathy with an effort to improve township roads, and there is no branch of our work in which I am more keenly interested. If you include colonization roads we have in Ontario about 30,000 miles of surfaced roads, and in Southern Ontario we have about 27,000 miles of surfaced roads. If the United States could equal that, in proportion to their population, they would have about 1,000,000 miles of surfaced roads but they have only slightly over 500,000 miles. Ontario, in proportion to population is holding her own well in the construction of good roads, and I attribute this work to the superior municipal organization that we have in Ontario as compared with other places. That is a fact which I do not think the people of this province appreciate. We have in Southern Ontario about 23,000 miles of gravelled roads. They are not all of high class construction, and they are not all maintained as they should be, but they are gravelled roads that you can get over at any season of the year, and they are vastly superior to the mud and sand roads which would otherwise be in use.

Extend Township Roads

The important thing for the townships to do is to extend these roads as fast as they can, but in the meantime save what you have got. I hope that a considerable part of our effort in the future will be toward the encouragement of more efficient management of town-

ship roads in order that the surface that you have may be improved and kept in use, and that the surfaced township roads may be extended. We help, it is true, by a provincial grant but I expect and hope for almost more from the influence that our inspecting engineers will have in going around among you, meeting your officials, and meeting the township councillors, guiding and advising with them as to how they should do their work. I hope that every township will, as fast as it can, organize and create a system for the dragging of their roads so as to keep the township roads, the gravelled roads, in as good condition as possible. I hope you will adopt improved plans of grading in order that when you put on a surfacing it will be on such a grade that it will stay on the road. We hope that in a short time every township will have a superintendent in charge of the work.

I am told by our engineers that since we initiated legislation towards this end that the tendency is strong in favor of commuting statute labour or doing away with it entirely and putting the work in charge of a superintendent. That is one of the most useful steps that a township can possibly take. It will not do to simply abolish statute labour and it will not do to simply commute it, the main factor is to see that the work is carried out systematically through a permanent road superintendent, along the lines that this association has advocated for many years. From the report of our engineers, I can say that all these things are coming along very rapidly, and I understand that about 60% of the townships have done away with statute labour.

Township and County Roads

The county road systems have been with us for many years and the are becoming an old thing with you. At one time they were new and the organization which you required was something which was of the keenest interest to this association. In my opinion the county road plan has reached the stage where they can fairly operate within themselves, and I hope that the Ontario Good Roads Association will take a keen interest in bringing the township roads up to the standard, so that when the provincial highways are completed, and the county roads well under way, we may have the full use of all this work by means of secondary roads, the township road, reaching out to every farm.

As I have indicated the provincial highway is at the present time absorbing a good deal of interest, in part because of the heavy expenditure. In one or two years the heaviest part of that expenditure will have been completed and from that time on we may expect to have an extension and a further development of the provincial highways, but the main features of the provincial highway will have been established, and it will become the least important of the system of highways for this association to consider. You will always have the township and county roads to improve. Our organization is now such that for every seven or eight townships you have a district engineer who is at your disposal for consultation, and I hope you will make good use of him. We want you to put yourselves in touch with him if he is not in touch with you, and what you cannot get from him we hope you will ask the central office for. We are here at your service eager to aid and help this big work of highway construction and improvement throughout Ontario.

The principal mineral producing province of Canada, according to the returns for 1921, was Ontario, where the value of mineral production was \$54,505,770. British Columbia came second with a mineral production valued at nearly \$35,000,000. Nova Scotia was a close third, with \$32,500,000. Alberta ranked fourth, with \$29,000,000. Quebec was fifth, with \$14,600,000, and Manitoba, Yukon, New Brunswick and Saskatchewan followed in the order named with productions between one and two million dollars each.

*Address before Twentieth Annual Meeting of Ontario Good Roads Association, Toronto, March 2.

ANNUAL MEETING OF THE TORONTO BRANCH, E.I.C.

THE PROGRAM of the Toronto branch of the Engineering Institute of Canada for the present session was brought to a conclusion on Thursday evening, March 16, when the annual meeting was held. Reports of committees were received and discussed and the new officers were installed for the ensuing season.

Geo. T. Clark, in making his retiring address, pointed out that the branch had been successful in wiping out an old financial obligation of \$199 to the Engineers' Club for bookcases and work done in connection with the library. The sum of \$125 has been advanced to the Library Committee for necessary improvements and an honorarium of \$100 each to the secretary, and to the preceding secretary has been paid. He spoke hopefully of the campaign for protective legislation in Ontario and highly commended the work of Willis Chipman and Col. H. J. Lamb in this regard.

The secretary-treasurer, F. B. Goedike, reported a cash balance in the bank of \$374.25, with an outstanding cheque of \$125, thus making a surplus of \$249.25. Col. H. J. Lamb, chairman of the Finance Committee, confirmed the report of the secretary-treasurer.

In commenting on the report of the Membership Committee the chairman pointed out that a considerable number of students who had applied for membership a year ago had not accepted their election and paid their fees, so that the actual membership of the branch is under 500. Had all those who were elected accepted their election, the membership would have been at least 650.

C. R. Young, chairman of the Publicity Committee, reported that every effort had been made to secure favorable mention of the activities of the branch in both the daily press and the technical press, and that on the whole the results had been satisfactory. J. M. Oxley, in discussing the report, deplored the fact that the daily newspapers almost always neglect to give the names of the engineers connected with a piece of work that is being described. T. D. Mylrea, chairman of the Committee on Ethics, reported that the work for the year had not progressed as rapidly as was hoped on account of his being unable to give much personal attention to the subject.

J. M. Oxley, chairman of the By-Laws Committee, described the work that had been done in preparing amendments sent out to the membership for adoption by ballot.

H. L. Seymour, Chairman of the Town Planning Committee, reported recent progress with respect to town planning in this district.

T. L. Crossley, chairman of the Committee on Sociology, reported progress pointing out that one meeting under its auspices addressed by Professor J. A. Dale had been held.

R. O. Wynne-Roberts, chairman of the Reception Committee, urged that every effort be made to assist the committee in obtaining the correct addresses of the members.

A. C. Oxley, chairman of the Library Committee, outlined the use to which the grant of \$125 was being put. The proceedings of the American Railway Engineering Association were being brought up to date and a number of valuable text-books were being added to the library. In discussing the report of the committee, G. G. Powell urged that an appraisal of the books owned by the branch be made for a possible increase in insurance. Frank Barber expressed the view that the insurance was not enough and that not enough money was being spent on the library. The resolution was finally carried, referring the matter of appraisal and extension of the library to the new executive.

R. T. G. Jack, chairman of the Committee on Employment, reported that on account of the lack of work in the engineering field, employers had not been able to offer any positions to which members out of work could be sent.

J. M. Oxley reported that as special representative of the branch on the committee appointed to consider the Lightning Rod Act he had carried out the duties assigned to

him and the Act, as revised, has been passed by the Legislature.

Votes of thanks were passed to Willis Chipman and Col. H. J. Lamb for their indefatigable work in connection with legislation in this province, and also to Geo. T. Clark for his conspicuous services to the branch and to the profession generally in vigorously directing the work of the branch during the last year.

The auditors, H. A. Goldman and T. L. Crossley, reported to the committee that the books of the secretary-treasurer had been examined and found to be correct. The nominating committee of which G. A. McCarthy was chairman, acted as scrutineers and reported that the following had been elected to office for the ensuing season: chairman, Wm. Storrie; vice-chairman, E. G. Hewson; secretary-treasurer, F. B. Goedike; committee men, R. C. Muir, N. D. Wilson and W. A. Duff.

The retiring chairman then called the chairman-elect, Mr. Storrie, to take charge of the meeting. In accepting the office Mr. Storrie regretted that by reason of the exigencies of election the services of some valuable members of the executive would unfortunately be lost for the coming year. He advocated that the position of chairman, at least, should be filled by acclamation and pointed out that certain advantages would accrue from the branch electing the executive and the executive electing the officers. F. B. Goedike and W. A. Duff of the new executive expressed their thanks to the membership for the support which they had received.

THE LAW AND ENGINEERING

AN UNUSUALLY clear presentation of the defects of engineering contracts was made by Alfred Bicknell of the legal firm of Bain, Bicknell, MacDonell & Gordon at the meeting of the Toronto Branch of the Engineering Institute of Canada held on March 9. The subject of Mr. Bicknell's address was "Some Legal Aspects of Engineering Problems," a topic that is of considerable interest to engineers, as was evidenced by the unusually good attendance for a meeting held so late in the session.

Mr. Bicknell, in introducing the subject, outlined the character of the work of the lawyer and the nature of law, contrasting statutory law with the common law. Enactments by statute, said the speaker, may recount what has been the law, or may establish new laws or regulations.

He pointed out that the statutory law differs by provinces, thus causing a good deal of confusion in interprovincial relations. Mr. Bicknell deprecated the practice of making numerous and frequent amendments to the statutes without an effort at codification. Where an act was not published with all the amendments incorporated in the text, there is a great chance of confusion and error. Codification is particularly necessary for the law of engineering and building.

The speaker traced the common causes of dispute in building and construction relations, pointing out that the owner is commonly ignorant of what he really wants, what the plans actually provide for, and as to whether the plans and specifications have been adhered to when the work is completed. He must entrust the whole matter to a technical expert, i.e., an architect or engineer who is constituted at one and the same time an impartial arbitrator and an agent of the owner.

Mr. Bicknell described at considerable length the essentials of a binding agreement, stressing the fact that there must be a clear offer and an equally clear acceptance. He cited many cases where a conditional acceptance had created litigation and had resulted in serious loss to one or other of the parties. Wherever new terms are introduced into the proposal there is no definite meeting of the minds, unless both parties definitely agree to them. A detail of interest to contractors mentioned by the speaker was that a tender or offer may be withdrawn any time before acceptance. If acceptance must be made in a definite or prescribed manner, and it not so made, there is no binding contract.

The essentials of contractual relations with corporations including municipal corporations and trading corporations, were then discussed by Mr. Bicknell. He pointed out that the danger attending agreements with municipal corporations requiring the authority of by-laws to undertake certain enterprises. Unless such by-law is passed the person making a contract with the municipality is not able to recover. He cited the particular case of Montreal where unless a definite appropriation has been made for work, or the expenditure has been positively authorized by the governing body of the city, the contractor cannot obtain compensation for his work. Mr. Bicknell mentioned the fact that in order to take action against the Dominion or Provincial governments, it was necessary to first obtain a fiat of the Minister of Justice or the Attorney-General, respectively, and then to proceed by petition of right. While governments are in some respects powerful, said the speaker, they have no authority to modify the terms of a definite contract. He cited the case of the Minister of Public Works of Canada in a former government illegally ordering certain extras to be carried out in the construction of a wharf. As the contract definitely said that extras would be allowed only on the written order of the engineer in charge, the contractor was unable to recover for the extras.

Following the address a vigorous discussion occurred in which many members of the Branch took part. A. T. C. McMaster wished to know how the submission of a cheque with a tender affected the withdrawal of the tender before acceptance. A. A. Robertson asked what should be regarded as a reasonable time for acceptance. T. L. Crossley enquired as to whether an unconfirmed telegram had binding power. J. B. Carswell pointed out some of the weaknesses of common contracts from the point of view of the contractor. He called the attention of the Branch to the standard contract form prepared by the Canadian Association of Building and Construction Industries and urged that action be taken on this form by the Council of the Institute to whom it had been submitted a year ago. J. M. Oxley objected to plans being classed as goods under the law and wished to know what the powers of a municipal commission were in retaining expert assistance by the mere authority of the executive of the commission. E. M. Proctor expressed the view that where the mayor of a municipality causes the employment of an expert without the authority of a by-law he should be liable on the ground of breach of warrant of authority. He wished to know if the motion of a municipal council to which the seal was attached would be regarded as a by-law. He called attention to the fact that in a case where a contractor had built a bridge on the verbal instruction of the council without definite by-law or written resolution he had been able to obtain payment for his work by appealing to the courts. William Storrie asked if it is necessary to wait until a nuisance has actually been created before applying for an injunction to restrain the parties contemplating an objectionable act.

Mr. Bicknell in replying to the various questions asked, stated that the submission of a deposit cheque with a tender did not prejudice the right of the bidder to withdraw his bid before acceptance. A reasonable time for acceptance would have to be established with all the circumstances of the case in mind. A telegram really does not require confirmation in order to be legally binding, said the speaker, although confirmation is most desirable to prevent possible errors in transmission. The actual status of the architect, according to the speaker is outlined in the contract, where his powers are definitely defined. He is in some respects an agent and in others an impartial arbitrator between two parties. The authority of a municipal commission to enter into contract should be based upon its status as a trading corporation, said Mr. Bicknell. He was of the opinion that the motion of a municipality with a seal attached was in effect a by-law. Replying to Mr. Storrie, the speaker stated that it was not necessary to await until a real nuisance had been created but if it could

be established that a contemplated act would undoubtedly create the nuisance, the injunction could be obtained beforehand.

Other members contributing to the discussion were R. J. Fuller, H. A. Goldman and C. R. Young.

RAILWAY DEPARTMENT FORMED BY WISCONSIN HIGHWAY COMMISSION

THROUGH the formation of a Railway Department as an active branch of the Wisconsin State Highway Commission, definite recognition has been given to the necessity of careful planning in the relocation of highways and expert consideration of the question of eliminating grade crossings.

M. W. Torkelson, former bridge engineer for the Wisconsin commission, has been placed at the head of the new Railway Department. His work will be chiefly connected with relocation of highways and elimination of grade crossings. The Wisconsin authorities are firmly convinced that many dangerous crossings can be eliminated by proper steps before expensive improvements are carried out, and that by careful relocation many of these crossings can be abolished altogether.

Highway officials, as shown by the Wisconsin innovation, are realizing more and more that the duties of government departments include not only the construction of good, durable roads, but precautions for the safety of the motoring public, such as separated grades and properly located routes.

Notice has been given that a charter is being sought for the erection of a bridge over the Niagara River to connect Fort Erie and Buffalo.

According to chief engineer A. Grant, work on the various sections of the Welland Ship Canal, under contract will be under way by the end of March. Already, contractors are increasing their force of men no less than 1,000 being at work at sections 3 and 4. Porter Brothers have doubled their staff at sections 1 and 2, over their January force. With the opening of work upon a larger scale, considerable relief is expected in the unemployment situation throughout the Peninsula and is already being felt in some measure.

Engineers of Ottawa participated in an extremely enjoyable function on March 16, at the Chateau Laurier, where luncheon was held under the auspices of the local branch of the Engineering Institute of Canada. The chairman of the branch, K. M. Cameron, presided, and there were ten speakers, all past-chairmen of the Ottawa branch, who were each given three minutes to tell engineering stories. A prize was the reward offered by the chairman for the speaker adjudged to have told the best yarn. Of the past-chairmen of the branch since the year 1909 inclusive, only three found it impossible to attend, W. J. Stewart, who was chairman in 1910, S. J. Chapleau in 1912, and G. A. Mountain in 1914.

Medals of the Engineering Institute of Canada have been presented to the following members. P. Ackerman of the Shawinigan Power Co. the Czowski gold medal for his paper on the relay protective features of the Toronto transmission and distribution system. The Plummer medal went to Dr. Alfred Stansfield, professor of metallurgy at McGill. It is presented and endowed by J. H. Plummer of the Dominion Iron and Steel Co. for the best paper on metallurgical subjects. For the first time the Leonard Medal, prepared according to designs made by Walter J. Francis and F. J. Brown and approved by the Institute as well as the donor, a virgin medal in honor of the event, will be presented to Lt.-Col. W. R. Leonard, of St. Catharines, Ont. The medal is made from pure gold from the Coniagas Mine.

MECHANICAL TESTING

Reviewed by

Peter Gillespie,

Professor of Civil Engineering, University of Toronto.

MECHANICAL TESTING—A Treatise in Two Volumes—By R. G. Batson and J. H. Hyde, assistants in the Engineering Department of the National Physical Laboratory, Teddington, England. Vol. I. London: Chapman & Hall; The D. U. Series. Cloth; 5 by 8½ in.; pp. 413; profusely illustrated; 21s.

In a review of an American book entitled "Addresses to Engineering Students" published a decade ago, the present writer remarked that in the compilation of the volume in question, the editors had not seen fit to go beyond the boundaries of the United States for their material and that from the ripe scholarship and varied professional attainments of British engineers it contained not a single message. The provincialism there complained of is happily not observable in the volume before us. The publications of all progressive nations have been freely and diligently consulted and as generously acknowledged and while the text displays some features peculiarly English, much of its excellence is due to its cosmopolitan character.

The first three chapters are given over to a consideration of the fundamentals of theoretical mechanics, the theory of stress and strain and the elastic behavior of materials under stress. We cannot help feeling that something would have been gained had a uniform method of orienting stress-strain and load-deformation curves been followed instead of the two methods indiscriminately used.

In that section devoted to testing machines and accessories, the mechanical principles governing the design of testing machines of the single lever, multiple lever pendulum, and Emery types, etc., are explained. By numerous half tone engravings and line drawings most of the types are illustrated and their methods of operation made plain. In order to secure accuracy, obviously the first desideratum in a testing machine, ease of calibration and sensitiveness are declared to be essential. Other requirements are given as accessibility for easy operation and simplicity and convenience in the method of gripping the specimens. With these assertions, all users of testing machines will be in agreement.

Chapter eleven is given over to a description of precision instruments whereby deformation in stressed material may be accurately measured. These include extensometers, compressometers, torqueometers and deflectometers. The devices primarily employed are classified as follows: (1) the micrometer screw, (2) the indicating dial, (3) the microscope, (4) the multiplying lever, and (5) the optical magnifier.

The limit of precision of the mirror apparatus, the last mentioned and of which the Bauschinger and Martens extensometers are types, is given as 4-millionths of an inch which is probably not inaccurate. Most of the illustrative drawings are diagrammatic only—all non-essential parts having been omitted—and are readily understood.

Other matters treated in the text in a usually comprehensive way are Commercial Testing, Cast Iron, Effect of Shape of Specimen and Time of Loading, Autographic Apparatus, Repeated Stresses, Fatigue in Materials, Hardness and Abrasion, Temperature Effects, Timber, Stone, Brick and Concrete, Road Materials, Limes and Cements, etc.

An excellent feature of the text is the inclusion at the end of each chapter of a partial bibliography covering the topic treated therein. While the text does not pioneer any new fields, it brings together in a lucid and usable way the present day knowledge of the art of commercial and scientific testing. The presswork and paper are good and alto-

gether it is a volume that should appeal, as the preface implies was intended, to the engineer, the manufacturer and the student.

Volume II is not yet off the press.

SEWAGE PURIFICATION

Reviewed by

Hector S. Philips

Assistant City Engineer, Hamilton, Ont.

MINISTRY OF HEALTH REQUIREMENTS AS TO SEWAGE PURIFICATION—With extracts from the reports of the Royal Commission, and other engineering data. By S. H. Adams; 39 pp., demy 8 vo., cloth. Published by St. Bride's Press Ltd., 24 Bride Lane, Fleet St., E.C. 4, London, Eng. Price, 6s. (\$1.50) net, post-free, 6s. 4d.; limp leather binding, 1s. 6d. extra.

This book, now in its fourth edition, is published under the auspices of the Ministry of Health (England) and much has been added to former editions in the way of selected passages from the well-known "Reports of the Royal Commission on the Treatment of Domestic Sewage and Trade Waste Liquors."

Mr. Adams has admirably presented the Requirements of the Ministry of Health as to sewage purification, summarized in the form of tables and charts, with explanatory notes, together with a compilation of standards of purity of effluent as governed by the available dilution required by the various English rivers or drainage boards. Charts are reproduced from the Fifth Report of the Royal Commission which show the results which may be expected of strong, medium or weak sewages by certain standard types of treatment.

Mr. Adams has also included a brief explanation of various processes of sewage treatment from chemical purification to activation and bio-aeration.

Other principal contents are a statistic chart prepared by Mr. Adams, showing tanks, filter capacities, etc., and tables devoted to amounts of removal of suspended matters in tanks after different treatments. Quantity of tank liquors which may be treated in percolating filters and contact beds, summary of the "Requirements" as to tanks and filters, amounts of air required for the activated sludge system, volumes of sludge produced by different processes of treatment, amount of treatment necessary to effect purification of different classes of trade waste liquors, and so on.

The remainder of the book is taken up by miscellaneous tables of sewerage and other useful engineering data together with the author's notes on velocity of sewage flows, water consumption samples and analysis, etc. Examples of sewer-flushing diagrams made by the author after a series of tests extending over a number of years are also published.

It is regrettable that tables only of flow in sewers are given, as diagrams on logarithmic paper have a much wider application. More information regarding sewage-disposal matters based upon Mr. Adams' own wide experience, would be welcome in future editions.

The general style of the book is concise and while it is of especial interest to engineers engaged in preparing sewage-purification schemes in Britain, it should be invaluable to all sewerage engineers as a book of ready reference.

STORING AND SEASONING CROSS TIES—Bulletin No. 20, issued by the Century Wood Preservation Co., Pittsburgh, Pa.; 16 pages, 8½ x 11 in., printed on coated paper; well illustrated. This bulletin discusses air seasoning and the factors which influence it, seasoning by steam, possible deterioration of ties while seasoning, the handling and storage of cross-ties, and methods of piling ties.

MANUFACTURE OF PORTLAND CEMENT by Arthur C. Davis. Published by John Falconer, Dublin, Ireland. Third edition; 416 pp.; 100 illustrations; 5½ by 8½ ins.; leather; \$6.50.

STRESS DETERMINATION BY PAPER MODELS

LABORIOUS determination of stresses in statically-indeterminate frames and structures has suggested to many designers the expediency of stress determination by measuring the deformation of models. From time to time instances of such procedure have occurred, but unusual success has been achieved in this regard by Professor Geo. E. Beggs, of Princeton University, who recently communicated the results of his researches to the American Concrete Institute at its annual meeting.

Suggested originally by the determination of the reactions of a continuous bridge truss of three spans by observing the deformations of a wooden strip, Professor Beggs extended these investigations to a variety of statically-indeterminate frames. These at first were made of celluloid, but later of cardboard to a reduced scale. A known load was then applied at a selected point and the deformation produced thereby at that point was observed by means of a microscope. At any other point where the stress condition was to be determined, another microscope was placed and the deformation accompanying the loading was found. Then by applying Maxwell's principle of reciprocal deflections, he was able to determine the stress at the second point. The models studied were of arch ribs, portal frames, circular rings, transverse bents, a series of arches, culverts, and related structures. The results of this mechanical stress determination were checked up carefully by the correct theory and the conformity of the results was surprisingly close. Indeed, in some cases, Professor Beggs is of the opinion that the stress determination by model is more accurate than by theory.

If stresses made thus be found in complicated structures by the construction and observation of small size models with sufficient accuracy for all practical purposes, it is to be expected that a much more extensive use will be made of this method than has heretofore been the case. The extraordinarily tedious calculations required in solving some complicated frames often lead to the practical man making a guess at the stresses rather than figure them out accurately. It may thus happen that through the incentive given by the researches of Professor Beggs, a closer proportioning of statically-indeterminate structures may arise, and at the same time the economic properties of restrained and continuous frames may be taken advantage of rather than avoided on the ground of difficulties in design.

THE TROLLEY BUS ARRIVES

CONSIDERABLE promise as a transportation agency is offered by the trackless trolley or so-called trolley bus. As a result of experimental work undertaken by the General Electric Co., trolley buses have been installed at Norfolk, Va., Richmond, Va., and Staten Island, N.Y. and have now been operating for some time. Based on a movement of over 100,000 bus-miles, it is said that the operating cost is approximately 18 cents per bus-mile. If this be a reliable figure on which to base comparisons it is evident that both the electric car and the motor bus will have to meet keen competition from this new vehicle. Certain investigations made by the Commissioners of the Department of Public Utilities of the State of Massachusetts indicate that allowing for taxes and interest on investment at 8%, the cost per bus-mile averages about 24 cents, per electric car-mile about 48 cents, per car-mile for one man safety car about 25 cents, and per trolley bus-mile about 21 cents. Apparently, therefore, the trolley bus is able to compete advantageously with these other forms of transport.

The basis of economy in trolley bus installations is of course the fact that no expenditure for track or roadway construction is necessary and that the power cost is less than for motor bus. Overhead construction is but little more expensive than that required for ordinary electric cars and the type of vehicle is much cheaper than the electric car.

Recently, four trolley buses have been purchased by the City of Toronto and are to be tried out in an experimental way on Mount Pleasant Road. The results obtained will have an important bearing on the future of this form of transport in Canada. It would be too soon, however, to adopt any definite transportation policy with respect to the trolley bus until it has been tried out under all probable weather and operating conditions.

WATER POWER DEVELOPMENT IN CANADA AND THE UNITED STATES

IN A popular magazine published in the United States, reference was recently made to the fact that according to the United States Geological Survey, 40% of the developed water power of the world is in the United States, although that country possesses only 6% of the total potential water power. Reference is made with evident satisfaction also to the fact that the water wheels of the United States have a present capacity of 9,243,000 h.p.

While it is not desired to minimize the achievements of the republic to the south in the matter of water power development, it is of interest to note that the water power development per capita in Canada is 201% more than it is per capita in the United States. At the end of 1920 the installed horse-power per thousand of population in Canada was 280, whereas per thousand of population in the United States it was only 93. It is no doubt true that the lack of fuel in this country has been responsible for the comparatively intense development of water power, but this fact renders the achievement no less remarkable.

PERSONALS

BENJAMIN MICHAUD, Deputy Minister of Highways for Quebec for nearly 25 years, has been given six months' leave of absence on account of ill-health.

PERCY J. JENNINGS, acting assistant commissioner of irrigation, has been elected chairman of the Calgary branch of the Engineering Institute of Canada.

RUFUS STENTON, of Port Lampton, Ont., has been appointed a county road commissioner on the highway between the fifth and ninth concessions, Sombra Township.

HARRISON P. EDDY, consulting sanitary engineer of Boston, Mass., was in Hamilton, Ont., last week looking over the sewer system and consulting with the local authorities.

A. B. SILCOX has been appointed director of the Citizens Municipal Research League of Calgary. Mr. Silcox, who graduated from Toronto University in 1906, is at present head of the Engineering branch of the Toronto Municipal Research Bureau.

OBITUARIES

WILLIAM CANNELL, president of the Cannell-Spencer Construction Co., Edmonton, Alta., died on March 12 after a long illness. The deceased was born in Bruce County, Ont., in 1866 and moved to Edmonton in 1903, where he founded one of the first contracting companies organized in that city.

THOMAS S. BROOKES, a former well-known contractor of Vancouver, B.C. and Kingston, Ont., died recently at the age of 79 at Vancouver. The deceased was born in England and came to Canada 48 years ago, settling in Kingston, where he lived 24 years. In 1900 he moved to Vancouver and continued to carry on business as a building contractor.

MANUFACTURERS WOULD AID BUREAU OF RESEARCH

IN DEALING with the establishment of a National Bureau for Industrial Research, the Canadian Manufacturers' Association made representations to the Dominion Government that a measure similar to the one defeated in the Senate at the last session should be enacted.

From a national standpoint, Governmental expenditure with the object of improving the quality or increasing the quantity of any class of production is at all times advisable. This has been recognized by Governments in the past in connection with agriculture, technical education and reforestation.

From an industrial standpoint, the method by which the greatest assistance can be rendered by the Government to manufacturers is the establishment of an Industrial Research Bureau, with facilities for conducting experiments which must of necessity be carried on for the development of manufacturing.

Probably no single factor was more conducive to the rapid expansion of Germany industrially than was the assistance rendered by the German Government in this manner. In recent years an attempt has been made along such lines by the Honorary Advisory Council for Scientific and Industrial Research, but as the services of those connected with the Council were given voluntarily, and as no facilities were placed at their disposal for experiments, their accomplishments, while valuable, were necessarily limited.

"The Canadian Manufacturers' Association realizes that at the present time new expenditures should be incurred only for pressing necessities or where they will result in benefits fully justifying the outlay. It believes that the good results which will accrue from an appropriation necessary to provide accommodation, equipment and staff for a Bureau of Standards and Research at Ottawa would in a short time increase the national wealth out of all proportion to the expenditure entailed, and we consequently request the Government to give such proposed expenditure their earnest consideration."

Letter to the Editor

LIBRARIES FOR RESEARCH WORKERS

Sir—I note with interest the letter from A. S. L. Barnes on page 294 of your issue of March 7, and I should like to do what I can to encourage Toronto to have a central catalog of the various organizations mentioned, and as many others as would be interested. We have been groping around for something of this sort in Boston for a long time and lately have been talking about a "community catalog," which would contain references not necessarily to all books owned by the co-operating libraries, but to books that it would hardly pay more than one or two to own, and these on the principle that "If you will buy this book, I will buy that." The same principle would apply to out-of-the-way periodicals.

The Boston Public Library, the Harvard College Library, and the Library of the Institute of Technology have been considering the "co-operative catalog", and it is likely that out of the various plans afoot something will happen here before long. In the meantime, some of us have been at work on what we call the "Coordinator," a series of loose sheets indicating where to find information in the vicinity, particularly on subjects of wide interest.

Thus far, we have sheets on seven or eight subjects, including, Tel-U-Where Company of America, Foster Service, Availability of Lantern Slides, Vocational Information, and two or three others. Also, I have been getting about twenty-five students in a graduate class at Harvard to work up subjects as a part of their class practice, and with a view to co-ordinating academic and business life. These subjects are all presumably of interest to such organizations as Stone & Webster, Inc., and various other engineering and commercial concerns.

G. W. LEE,

Librarian, Stone & Webster, Inc.

Boston, Mass., March 13, 1922.

GOOD ROADS ASSOCIATION CONVENTION

AT TENTATIVE program is being prepared by Secretary George A. McNarnee of the Canadian Good Roads Association at the head office in the New Birks Building, Montreal, for the ninth annual convention to be held at the Empress Hotel, Victoria, B.C., on June 13-16, inclusive. The program will include addresses by distinguished highway authorities of Canada and the United States, and will be even more comprehensive than at any previous convention, as an extra day will be devoted to business sessions, making four days instead of three utilized in past years. All sessions will be conducted on daylight-saving time if it is in force in Victoria. For the fifth day, Saturday, a number of sightseeing trips will be arranged which should prove both educative and entertaining.

The convention is being held in direct co-operation with the Good Roads League of British Columbia and the Good Roads Association of the Western Provinces. The official recognition extended to the Canadian association is indicated by the fact that assurances have been received of the presence as delegates of Dominion Government highway officials, Provincial Ministers with their deputy Ministers and chief engineers, highway commissioners and the Mayors, councillors and engineers of many municipalities. There will also be representatives of contracting firms, suppliers of paving materials and machinery and the automotive interests.

An illustrated lecture on the "Chippawa Canal Development," by R. T. Jeffrey, of the Ontario Hydro-Electric Commission engineering staff, was given before the Rotary Club in the Chamber of Commerce, Brantford, on March 16.

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Regina, Sask., erection of Chemistry Building	Mar. 31	Mar. 7
Lethbridge, Alta., masonry construction Morton, Man., gravelling of several St. Catharines, Ont., road construction and material	Mar. 30	Mar. 14
Chippawa, Ont., construction of concrete intake structure and ship channel in Niagara River	Apr. 1	Mar. 14
Halifax, N.S., highway construction, Yarmouth-Shebbourne County line to Woods Harbor	Apr. 10	Mar. 14
Ontario, Province of, widening and deepening the channel of the Welland River and a portion of the Queenston-Chippawa power canal..	Mar. 30	Mar. 14
	Apr. 10	Mar. 14

BRIDGES, ROADS AND STREETS

Bridgeburg, Ont.—The question of a viaduct over Central Ave., to connect the Amigari section of Bridgeburg with the remainder of the town, is to be taken up with the Dominion Railway Board immediately. Town Clerk, H. G. Patriarche.

Calgary, Alta.—The city commissioners recently met P. L. Naismith, manager of the Natural Resources Department of the C.P.R., and discussed with him the possibility of the C.P.R. becoming a party in the construction of a new bridge over the irrigation canal at Seventeenth Ave. East and the city limits. It is understood that the C.P.R. has intimated their willingness to come into the scheme.

Chatham, Ont.—Contract for the construction of 2½ miles of pavement to Richmond St. has been let to Campbell & Lattimore, Toronto.

Chatham, Ont.—Chatham Suburban Area Commission is planning an extensive program for this year. Over two miles of road on the Chatham-Dover town line will be paved, and other roads close to the city will be improved.

Chatham, Ont.—Chatham Suburban Area Commission is planning an extensive program for this year. Over two miles of road on the Chatham-Dover town line will be paved, and other roads close to the city will be improved.

Ford City, Ont.—Town Council considering purchase of digging and paving machine. Clerk, J. F. Foster.

Guelph, Ont.—Public Works Committee will recommend to City Council that a pavement be laid on Kathleen St., Glasgow St., Waterloo Ave., Dublin St., Lyon Ave. and the London Road. City Engineer, F. McArthur.

Hamilton, Ont.—City Engineer E. R. Gray will prepare an estimate on cost of widening parts of Catharine St.

Hamilton, Ont.—The asphaltting of Gage Ave. northerly to the plant of the National Slag Products Co. was decided on by City Council. Also construction of a concrete sidewalk on Burlington St.

Hamilton, Ont.—Authorization for the raising of Ferrie Street bridge and the G.T.R. tracks to accommodate the

Wellington St. storm overflow sewer, was received by City Council from the Dominion Board of Railway Commissioners.

Harrow, Ont.—Township Council of Colchester South is securing a loan of \$10,000 from the Department of Highways for road improvements. Clerk, J. H. Madill, Harrow.

Kitchener, Ont.—City Council decided to pave Weber St., between the G.T.R. and Breithaupt St. City Engineer, S. Shupe.

London, Ont.—Middlesex County Engineer Charles Talbot is preparing plans for county road improvements this year that will approximate \$200,000. The bulk of this amount will be for maintenance. About \$25,000 will be expended on new bridges and culverts.

North Toronto, Ont.—North Toronto Ratepayers' Association made an application to the council for co-operation in the movement to have a subway at the G.T.R. crossing on Eighteenth St. Council approved and will support the object.

Ontario, Province of.—Hon. F. C. Biggs, Minister of Public Works and Highways, introduced into the Legislature an act to provide for future construction and maintenance operations on the Toronto-Hamilton highway. It contains also a slight amendment to take care of the building of the last bridge on the highway.

Ottawa, Ont.—Suburban Road Commission decided to call tenders for a mile of sheet asphalt on the Richmond road and 2½ miles of sheet asphalt on the Metcalfe road. Also for 60,000 gallons of bituminous material, for 1,000 barrels of cement and a quantity of pipe. Chairman, John Bingham.

Peterboro, Ont.—Board of Works decided to have a concrete pavement laid on George St. south, from the C.P.R. to Romaine St. Tenders will be called. The Board also authorized the purchase of \$50,000 gallons of road oil. City Engineer, R. H. Parsons.

Sandwich, Ont.—The Canadian end of the Detroit-Windsor suspension bridge will be in Sandwich, and construction will probably begin in May, it was recently announced at the offices of the American Transit Co., in Detroit.

Sandwich, Ont.—Essex County Council approved an expenditure of \$607,000 for good roads and the maintenance of old roads this year. Road Superintendent, W. K. Kinster, Sandwich.

Sherbrooke, Que.—The following by-laws will be submitted to the ratepayers: To provide \$175,000 for the construction of sidewalks; viaduct, \$25,000; reconstruction of Dufferin Ave. bridge in steel and concrete, \$55,000; leveling of King St. west, \$20,000.

Stratford, Ont.—It is likely that Erie, Britannia and Hamilton Streets, and part of Perth St. will be paved this summer. City Engineer, A. B. Manson.

Toronto, Ont.—Extension and grading of Patterson Ave. to Sunnyside Ave. passed City Council.

Toronto, Ont.—The proposed Riverdale Ave. extension through the Harris estate to Pape Ave., was referred back to the works committee by the City Council.

Toronto, Ont.—City Council intends to construct concrete sidewalk on Teranulay St. west side, from St. Joseph St. to St. Mary St., at a cost of \$3,300; also asphalt pavement on same street, from College St. to Davenport Road, \$240,896.

Toronto, Ont.—The City Council decided to reconsider the Illoor St. widening project, and referred it to the Works Committee, so that the members of that body may, should

they think it advisable, forward a new recommendation that the work be proceeded with.

Toronto, Ont.—It is stated that Works Commissioner Harris has put a proposition before the steam railway companies in connection with the Bloor St. "gap" problem, upon the following basis: (1) A subway to be built under the northern division tracks; (2) a bridge to be built over the middle division and C.P.R. tracks.

Toronto, Ont.—Tenders for concrete pavements were received on March 6 by the Ontario Department of Public Highways from the following firms: Campbell & Lattimore, Toronto; Lumsden Engineering & Transport Co., Toronto; G. G. Chisholm, London; Archibald Construction Co., 122 Delaware Ave., Toronto; Cadwell Sand & Gravel Co., Windsor; Kingston Construction Co., Kingston; Frid Construction Co., Hamilton; W. J. Boss, London; McNamara Bros. & Thornton, Sault Ste. Marie; Sheehy & Son, Peterboro; Chick Construction Co., Windsor; Johnson Bros. Co., Ltd., Brantford; Oakwood Construction Co., Ltd., Windsor. No official announcement has yet been made regarding awards.

Toronto, Ont.—Tenders for asphaltic concrete pavements were received on March 6 by the Ontario Department of Public Highways from the following firms: Roger Miller & Sons, Toronto; Johnson Bros. Co., Ltd., Brantford; Brennan Paving Co., Arnprior; Provincial Contracting Co. (Kilmer & Barber), Toronto; Godson Contracting Co., Ltd., Toronto; Warren Paving Co., Toronto; Standard Paving Co., Ottawa; McQuigge & Russel, Excelsior Life Building, Toronto; Constructing & Paving Co., Toronto; Bartram Construction Co., Toronto; Merlo, Merlo & Ray, Windsor. It is unofficially rumored that contract has been awarded to Rodger Miller & Sons for the Ancaster road, to Johnson Bros. for the Winona road, and to Brennan Paving Co. for the Galt road.

Windsor, Ont.—Ouellette Ave., Wyandotte St., Mercer St., Montmorency St. and Howard Ave. will be surfaced with sheet asphalt this year. City Engineer, M. E. Brian.

York Tp., Ont.—The Township Council plans to widen Scarlett Road, Dawes Road, Dundas St., Vaughan Road and Weston Road.

WATER, SEWAGE AND REFUSE

Guelph, Ont.—Public Works Committee will recommend to City Council that a storm sewer be laid on Derry St. City Engineer, F. McArthur.

Hamilton, Ont.—Board of Health recommended sewers on Simcoe St., from Mary St. eastward, and on an alley between Mary and Ferguson Ave., near Simcoe St.

Kitchener, Ont.—City Council decided to construct a sewer on Pandora Ave., between Weber and Samuel Streets. City Engineer, S. Shupe.

Mimico, Ont.—Water mains are to be laid this spring on Dean St., from Cunard to Dwight; on George St., from Mimico Ave. to Edythe Ave.; from Lake Shore Road to Central Ave., on Hillside to Melrose; on Milton, from Melrose to Algoma, and on Algoma, from Wesley to Milton St. Clerk, J. A. Telfer.

Niagara Falls, Ont.—Water Commission decided to have mains laid on Elm St., Ross, Spring, Summe and Orchard Streets. Commission will call for tenders for proposed booster pumphouse and dwelling.

Niagara Falls, Ont.—Bell & Bell were awarded contract for trenching and back-filling in connection with the city's water works; H. W. Bickle & Co., Main St., were awarded contract for galvanized pipe and fittings; and Gartschore-Thompson Pipe & Foundry Co., Ltd., Hamilton, were awarded contract for cast iron pipe.

Ottawa, Ont.—City Council intends to construct 15-in. tile sewer in Ralph St., from Broadway Ave. to the lane between Woodlawn Ave. and Center St.; in the said lane from Ralph St. to Monk St.; and in Monk St., from the said lane to Center St. Also a 12-in. tile pipe sewer in Ralph St., from the said lane to Center St. Estimated total cost, \$10,447. City Clerk, N. H. H. Lett.

Sherbrooke, Que.—By-law for providing for the raising of \$115,000 for the construction of sewers will be submitted to the ratepayers.

Woodstock, Ont.—Local Board of Health will request City Council to submit a by-law at next municipal election to provide \$38,500 for an incinerator.

LIGHT, HEAT AND POWER

Kitchener, Ont.—City Council decided to proceed with the construction of a 6-in. gas main on King St. east, between Cedar Grove and Sheldon.

London, Ont.—City will apply to the Provincial Legislature for authority to raise \$141,000 for the construction of a dam in the River Thames at Springbank Park.

St. Catharines, Ont.—Fire damaged the plant of the Packard Electric Co., Ltd., to the extent of \$20,000. Six large transformers for the Hydro Commission, which were ready for shipment, were damaged.

Windsor, Ont.—The development of hydro-electric power at Avon Falls, near here, is projected by the Avon Power Co.

York Tp., Ont.—Township Council approved of Hydro lights for Willard Ave., Frater Ave., and Westmount Drive.

RAILWAYS

Fraserville, Ont.—J. D. McMillan, superintendent of the G.T.R., announced that work on the new station will commence shortly.

Hamilton, Ont.—City Council approved construction of a railway siding on the east side of Ferguson Ave., between Kelly and Wilson Streets.

Kitchener, Ont.—City Council approved of the extension of the Waterloo and Wellington Railway through to Guelph.

Toronto, Ont.—Transportation Commission desires to lay a double-track on Elizabeth St., from Dundas to Louisa, and single-tracks on Louisa, from Elizabeth to Teraulay; on Albert St., from Teraulay to Elizabeth, and on Elizabeth, from Albert to Louisa St. Estimated cost of widening Elizabeth St., Albert and Louisa Street roadways, with 10-ft. sidewalks on the two former streets and a 6-ft. sidewalk on the north side of Louisa St., is \$75,000. Commission also desires to instal special work on Christie St. near Dupont St., and at the corner of Lansdowne and St. Clair Avenues. Estimated cost of pavement in both cases is \$1,148.

Windsor, Ont.—The management of the Essex division of the Hydro-Electric Railways contemplates laying new steel on Sandwich St., between Ouellette Ave., and Ferry St., this season. Tracks outside the towns of Tecumseh and Amherstburg will be rebalasted, and a booster station will be constructed at Amherstburg, if the entire program is carried out.

FACTORIES AND LARGE BUILDINGS

Annapolis Royal, N.S.—A new Town Hall, Court House and possibly a new hotel will be constructed this year.

Brantford, Ont.—The members of Shenstone Memorial Baptist Church plan erection of new church. Pastor, N. R. McCleod.

Bridgetown, N.S.—The members of Bridgetown Baptist Church decided to erect a Church School building. Pastor, Rev. Clyde W. Robbins.

Brockville, Ont.—The Bank of Toronto is about to commence the erection of new premises.

Bronte, Ont.—The erection of a school is projected.

Calgary, Alta.—Separate School Board plans erection of a four-room addition to St. Ann's school, at a cost of \$20,000.

Calgary, Alta.—Tenders will shortly be called for alterations to the stores building at the General Hospital. City Architect, Mr. Richards.

Chatham, Ont.—Board of Education is considering erection of Technical School.

East Toronto, Ont.—East Toronto Branch, G.W.V.A., decided to erect a clubhouse at a cost of \$25,000.

East Toronto, Ont.—Members of Calvary Baptist church have launched a campaign to raise \$25,000 for building purposes.

Edmonton, Alta.—Plans have been prepared for the new Eastwood school. Estimated cost, \$165,000.

Edmonton, Alta.—Empire Loan & Trust Co., of Winnipeg, will erect a garage at the corner of 102nd Ave. and 100th St., at a cost of \$25,000. Architects, Magoon & MacDonald. It is reported that a \$10,000 building is to be built on the west side of the new city telephone exchange for an "Orange Crush" factory.

Fort William, Ont.—A new building will be erected at the Industrial Farm this year at a cost of \$40,000.

Halifax, N.S.—Contract awarded to W. F. Bedwin & Co. for alterations to the Bloomfield school, at \$15,923.

Hamilton, Ont.—The local Hydro Commission plans to erect its proposed four-storey building on Catharine St. Chairman, Guy Long.

Hamilton, Ont.—Permit issued to Separate School Board for brick school building on Whitefield and Gage Avenues, costing \$25,000.

Hamilton, Ont.—W. T. Tomes, real estate agent, plans the erection of a large apartment house at the corner of King St. and Proctor Boulevard. Estimated cost, \$80,000.

Lacombe, Alta.—Work will commence this spring on the erection of a business block on the corner of Barnett Ave. and Railway St.

London, Ont.—Work on the erection of the Lloyd George Hotel will be started within a week.

Mimico, Ont.—Mimico and Long Branch Baptist Churches, having raised the necessary funds, will commence building operations on the new buildings shortly.

Mount Elgin, Ont.—Ratepayers of School Section No. 5 plan the erection of a continuation school costing \$15,000.

North Toronto, Ont.—A movement is on foot to have a railway passenger station erected at Eighteenth St.

Ontario, Province of.—Plans are being prepared by a London architect for the erection of the following schools: Six-room school at Hensall, four-room school at Melbourne, eight-room school at Springfield, two-room school at Mt. Elgin and a large school in connection with the Centennial Methodist Church in Sarnia.

Ottawa, Ont.—The Ottawa Tennis & Lawn Bowling Club plan the erection of a new clubhouse. Address Col. W. S. Conger.

Ottawa, Ont.—Contract for construction of cooling plant for Swift Canadian Packing Co., at the southeast corner of Bresser and Mosgrove Streets, has been let to Joseph Robert, 34 Laurier Ave. east. Approximate cost, \$10,000.

Pembroke, Ont.—Plans for a separate school for the West Ward have been completed by Architect Millson, of Ottawa.

Port Arthur, Ont.—A. G. Pounsford, manager, Port Arthur division Provincial Paper Mills, Ltd., announced the actual commencement of work on the construction of a paper mill extension to the company's present plant, at an estimated cost of \$1,500,000.

Port Credit, Ont.—School Board plans High School extension.

Port Credit, Ont.—Two rooms will be added this year to the continuation school.

Port Credit, Ont.—Four rooms will be added to Forest Avenue School this summer.

Port Credit, Ont.—Erection of new Anglican and Presbyterian churches is being discussed, and it is probable that steps will be taken this year to provide for the buildings.

Quebec, Que.—A movement is on foot among shipping men to have a second storey added to sheds Nos. 18, 25 and 26. Address W. G. Power, chairman, Quebec Harbor Commission.

Rocky Mountain House, Alta.—By-law passed authorizing raising of \$13,000 for purchase of site and erection of school.

St. John, N.B.—Contract for erection of recreation building on grounds of Lancaster Military Hospital has been awarded to H. O. Clark, at \$6,600.

St. John, N.B.—Erection of a Protestant Orphans' Home, costing between \$200,000 and \$250,000, is projected by the directors of the St. John Protestant Orphans' Home.

St. Stephen, N.B.—The Bijou Theatre, owned by J. W. Smith, proprietor of the Queen's Hotel, was destroyed by fire. Loss, \$15,000.

St. Thomas, Ont.—Alma College Board plan extensions and improvements to the college building, estimated to cost \$100,000.

Sarnia, Ont.—Under the direction of leading Canadian and United States steel men, a new industry is to be launched here to be known as the Dominion Alloy Steel Corporation. Construction of a \$3,000,000 plant capable of turning out 50,000 tons annually of alloy and high carbon steels will be commenced in a few weeks. The complete personnel of the board of directors has not yet been announced, but it is understood that it will include Harry R. Jones, till recently president of the United Alloy Steel Corporation, of Canton, Ohio; C. H. Wills, of Detroit, formerly chief engineer of the Ford Motor Co.; J. J. Mahon, formerly chief engineer of the Crucible Steel Co.; and Geo. A. Simpson, of Hamilton, sales manager of the Steel Company of Canada.

Smith's Falls, Ont.—Fire destroyed a large storage shed on the C.P.R. premises. It will cost \$30,000 to replace the building.

Stonewall, Man.—Rockwood Agricultural Society let contract to build a hall to Walker Bros.

Stratford, Ont.—The following buildings will be erected this year: Four-room addition to Hamlet School, new four-room public school on Downie St. and a \$75,000 mausoleum at the cemetery.

Thorold, Ont.—Methodist Church members have started a campaign to raise \$20,000 for church improvements.

Toronto, Ont.—City Council passed a recommendation that \$100,000 be raised for the erection of a nurses' home.

Toronto, Ont.—City Council sanctioned the purchase of a school site on Roxton Road by the Separate School Board of a 10-room school.

Toronto, Ont.—Jones Bros.' factory, Richmond and Sheppard Streets, is being demolished to make way for an eight-storey modern office building.

Toronto, Ont.—Members of Davisville Baptist Church have launched a campaign to raise \$20,000 for a new Sunday School building. Pastor, Rev. A. P. Wilson.

Toronto, Ont.—Ratepayers of S. S. No. 34, Fairbank, have authorized trustees to issue debentures amounting to \$13,000 for erection of two portable school rooms.

Toronto, Ont.—Confederation of Jewish Philanthropies plan erection of an orphanage on the southwest corner of Homewood Ave. and Wellesley Crescent. Estimated cost, \$50,000.

Toronto, Ont.—By-law will be introduced at next meeting of City Council providing for the raising of \$109,000 for the erection and equipment of a Technical school on Greenwood Ave.

Toronto, Ont.—Windermere Avenue Methodists, Runnymede district, plan the erection of a new church at Ostend and Windermere Avenues. Runnymede Presbyterian Church may also be replaced by a new building to be erected at Willard Ave. and Annette St., at a cost of \$50,000 or \$60,000.

Toronto, Ont.—Erection of four buildings at a cost of \$1,500,000 is contained in a request made by the Toronto University to the Provincial Government. This program includes a new Forestry and Botany building, an Administration building, additions to the heating plant and a Women's building.

Wetland, Ont.—St. Thomas Packing Co., of St. Thomas, will erect cold storage plant here at a cost of \$50,000.

The Canadian Engineer

A Weekly Paper for Civil Engineers and Contractors

Developments in Photographic Surveying

Camera Can be Used to Best Advantage in High Mountain Ranges — Description of Apparatus Used — How Photographs are Taken and Plotted — More Work in Office Than in Field

BY M. P. BRIDGLAND

WHEN preparing this article, it was the object of the writer to give a short account of the conditions under which photographic surveys are usually made and a brief description of the field and office work, without any attempt to deal with the subject from a theoretical standpoint. English literature dealing with this class of survey is scarce and in the majority of recognized text books, if mentioned at all, the chapter devoted to the topic does little more than acknowledge the existence of the photographic system or at best offers a very brief introduction to the subject. Even then there appears to be some difference of opinion as to the utility of the method, probably because the authors have had little or no practical experience with photographic work and are not personally familiar with the conditions, physical or climatic, under which much of the work must be carried on. Nevertheless photographic methods became firmly established a long time ago and afford the most accurate and economical means of mapping certain classes of country.

In actual work the photographs are really perspectives and from these the map is constructed. The principles involved were first suggested by J. H. Lambert, of Zurich, 1759, but no effort to apply them practically was made until 1791-3 when Beauteemps Beaupre made the first attempt, using a series of freehand sketches of the coast region of Tasmania and Santa Cruz island. Although himself convinced of the feasibility of the system, he failed to convince others, probably on account of the difficulty of making freehand drawings sufficiently accurate for the purpose, and so the method was practically forgotten.

In 1839, Arago called attention to the possibilities of utilizing photography and in 1849 Captain Leblanc made an attempt to apply it to French military surveys. All early attempts were much hampered by the slowness and uncertainty of the early photographic process, and by the heavy and cumbersome apparatus required. In 1850 Col. A. Laussedat (who was practically the father of photographic surveying) began a study of the subject using at first a "camera clara" for obtaining the necessary perspectives, tracing the outlines by hand. For some years he continued this work, improving the instruments and elaborating the methods, and when a suitable lens was obtained, substituted photographs in place of freehand drawings. In 1859 he felt justified in announcing his success to the Academy of Sciences in Paris, and after a careful and critical examination, a favorable report was made, and photographic surveying passed from the experimental stage and became a recognized science. Since that time it has made rapid strides and has been used extensively in many European countries and also in many other parts of the world.

The introduction of photographic surveying into Canada was due to Dr. E. Deville, Surveyor General of Dominion Lands, a man of high scientific attainments. He was quick to realize its value for mapping the extensive mountain regions of Western Canada and himself designed instruments which he considered specially suitable for the requirements. These instruments are still in use, almost in their original form, though minor alterations have been made and modern lenses have replaced those originally used in the cameras. In addition he wrote an exhaustive treatise entitled "Photographic Surveying" dealing with the subject from both a theoretical and a practical standpoint. Unfortunately only a limited edition was published and the book has been out of print for many years. In 1886, J. J. McArthur, with a small party, was sent out to commence a topographic survey of that part of the Rocky Mountains adjacent to the Canadian Pacific Railway. This work was continued for about seven years and although largely experimental in its early stages, was very successful and Mr. McArthur was able to map an area of about 2,000 square miles using a scale of 1/20,000 and a contour interval of 100 ft. Since that time many other extensive surveys of a like nature have been made in Canada by the Surveyor General's branch and also by other government departments.

FIGURE 1

Note:—Points A and B are located respectively at the right and left hand of illustration. P is at the intersection of horizontal and vertical lines.

*Paper read before the Fifteenth Annual Convention of the Association of Dominion Land Surveyors.

Photographic methods are not applicable to every class of country. It is necessary that there should be bare summits suitable for stations, and that there should be sufficient relief to permit the ready identification of the same points

on views from different stations. Consequently the camera cannot be used in districts where all the hills are heavily timbered. Considerable work has been done in foot-hill districts where occasional bare points can be found, and where views in one or more directions can be obtained by partially clearing off other summits occupied. Owing to

FIGURE 2

the difficulty, often impossibility, of getting stations where most needed and the absence of pronounced topography, the results are not entirely satisfactory. Still a very fair map may be made showing all the main features and much of the detail, and when criticizing, it should be remembered that it is a difficult and expensive matter to accurately map country of this nature by any other method. It is, however, in the higher mountain ranges that the camera can be used to the greatest advantage. Here there is no difficulty in obtaining stations and the mountains with their bold rugged outlines afford much better photographic subjects than the rolling foothills. In addition to this, mountain views usually cover a greater area and the identification of points may be accomplished much more rapidly and accurately than when dealing with less broken country.

Light Transit Used

On Canadian photographic surveys the essential instruments are a small transit and a camera. These instruments are of the simplest possible form so that there may be no complicated adjustments to get out of order.

The transit is a light instrument of the ordinary pattern made by Troughton & Simms, London, England, with 3-in. circles reading to minutes. The tripod has extension legs, 3 ft. 4 in. long when extended and 20 in. long when closed. When in use, a bag is suspended between the legs, and filled with stones, and then the legs and bag are blocked with more stones so that the tripod may be rigid in any wind. For packing, the tripod head is taken off and placed in the transit box, and the legs are placed in the back of a canvas case designed to hold both the box and the legs.

This case is fitted with shoulder straps for carrying and with the instrument and tripod weighs about fifteen pounds.

The camera consists of an oblong metal box open at one end and fitted into a strong outer wooden box case made of mahogany. The metal box carries the lens and two sets of cross-levels which may be read through openings in the outer case. Inside the metal box there are two sets of diaphragms to intercept any light which does not contribute directly to the formation of the image, the whole interior is blackened and as a further precaution, a shade is placed over the lens when exposing a plate. The back of the outer case is movable and is so arranged that when a plate is inserted in the camera it can be screwed in against the holder so that the plate is firmly held against the open end of the inner box, thus insuring that the plate is always in the same position relative to the lens. The instrument stands on a three-screw base similar to that of the transit, so that both instruments may be used on the same tripod. The camera may be used with the long side either horizontal or vertical. In the horizontal position the lens has a field of about 51 degrees and in the vertical position a field of about 37 degrees, the extent in either position being shown approximately by lines ruled on the case. The size of the plate is $4\frac{3}{4} \times 6\frac{1}{2}$ in. The carrying case is designed to hold the camera and twelve single plate holders and is fitted with shoulder straps. The total weight of the case with the camera and twelve plates is about twenty pounds.

In order to use the camera certain conditions are necessary. The plates, while being exposed, must be in a vertical plane, the position of the horizon and principal lines must be known and also the focal length of the lens. While these determinations may be made separately and by different methods, the writer has found it advantageous to make all of them at the same time, and to always make measurements by which the focal length of the lens may be computed, even though using the same lens from year to year. This means little extra work and affords an independent method of checking the focal length of the enlargements used in plotting as the contraction or expansion may vary in different lots of paper.

Tests for Focal Length

To make these tests, a place is selected where several points of about the same elevation may be found. This is usually a level meadow or a small valley. The camera is set up in a horizontal position and a level or transit placed a short distance away, so that the telescope of the latter is on the same level as the centre of the lens. Fig. 1 shows the transit placed in position. Then some distance away three targets, A, B and C are placed on the same level and

FIGURE 3

in such position that the two outside ones, A and C will be just inside the field of the camera when horizontal and A and B just inside the field when in the vertical position. A specially prepared mirror, long enough that the end projects about 4 in. beyond the camera, is then inserted and screwed up firmly against the inside case in the exact position oc-

occupied by the plate. The camera is turned until the reflection of one of the signals can be seen through the telescope and it is then tilted forward or backward by means of the foot screws until the horizontal hair of the telescope bisects the image of the target, the transverse level being kept in its centre position throughout. The mirror is then

FIGURE 4

in a vertical plane and the position of the bubble parallel to the axis of the camera is carefully noted. The mirror is removed, and with the camera very carefully levelled, one or more views are taken showing the transit and the three signals. After this the camera is set up in its vertical position and the mirror replaced. By shortening the legs of the tripod, the camera is lowered until the mirror shows above when viewed through the telescope and the position of the other bubble when the plate is vertical is found as before. When this is completed the mirror is removed and the camera raised until the lens is again level with the telescope, and other plates are exposed in the vertical position showing the signals A and B.

For the determination of the focal length, the transit is then moved to the position occupied by the camera and the angles subtended by the three signals are carefully read.

In making use of this information, the plate itself may be taken or the plotting enlargement. In either case the procedure is practically the same, but it is easier to work on the enlargement and that is really of more vital importance to the topographer than the negative. If several enlargements be used they will give practically the focal length for use in plotting as the contraction is not likely to vary much with the same lot of paper. This however, cannot be taken for granted and the dimensions of the enlargements must be carefully watched.

It is now necessary to determine the horizon and principal lines. On one of the horizontal views draw carefully a fine line through the centre of the targets A, B and C (Fig. 1) and then do the same on one of the vertical views. These lines represent the horizon lines for their respective views. Take the horizontal view and by means of the notches VV transfer the line from the vertical view and find P, the intersection of the two lines. This is the principal point of the view. Through P draw a line VV perpendicular to the horizon line. This represents the principal line of the view and if all levels are in proper adjustment, should coincide with the vertical line as transferred from the second, though this condition is by no means necessary. The vertical view is then treated in a similar way.

Determination of Focal Length

To determine the focal length, the distance from the signals A and C to the principal point P must be very carefully measured. The focal length is then found as follows:

Let the distances A to P and C to P (Fig. 2) be a and b respectively. Let PF represent the focal length f and let α and β be the angles AFP and CFP and let $\alpha + \beta = \theta$. All these are known angles, measured in the field.

Then $\tan \alpha = a/f$.

$\tan \beta = b/f$.

$\tan \alpha \tan \beta = a b / f^2$.

$\tan (\alpha + \beta) = \tan \theta = (a/f + b/f) / (1 - a b / f^2)$.

From this we have a simple quadratic equation,

$f^2 - [(a + b) / \tan \theta] f - a b = 0$,

which, when solved, gives

$f = (a + b) / 2 \tan \theta + [(a + b)^2 / 4 \tan^2 \theta + a b]^{1/2}$

Determinations of the focal length should be made for both positions of the camera as the contraction of the paper in different directions may vary.

Plates For Alpine Work

Photography in Alpine districts, particularly in the higher ranges, presents many difficulties. There are snow peaks glistening in the sunlight and deep heavily timbered valleys partly in shadow and often filled with a bluish haze due to atmospheric absorption and diffusion of light. Moreover the diffusion of light causes the more distant points to become indistinct, the landscape gradually merging into a uniform tint, an effect known as "aerial perspective." Now survey photographs must be clear and full of detail so that the points to be plotted may be well defined and easily identified. Hence to obtain satisfactory views, it is necessary to use plates which have great latitude of exposure and which give, so far as possible, a correct rendering in monochrome of all different colors. The plate used for some years on Canadian topographical surveys is the Wratten and Wainwright Panchromatic plate which is used with a yellow screen made by the same company, and known as a "C" filter. This make of plate is sensitive to all rays of light and when used with the screen, which reduces the effect of the more actinic part of the spectrum, i.e., the ultra violet to blue rays, has given excellent results. To prevent halation, or diffusion of light from the back of the glass, the back of the plate was formerly covered with a black substance in optical contact with the glass, but during the last season a double emulsion has been used instead. This means that the sensitized film is of sufficient density to absorb all light falling upon it during exposure and to prevent any light penetrating to the surface of the glass. Owing to their extreme sensitiveness, these plates must be handled in the dark not only in the field but also in the developing room. Because of this, there is no opportunity for controlling the development and the matter of correct

FIGURE 5

and uniform exposure becomes an extremely important factor.

There are many difficulties encountered in the field among the first of which are those involved in climbing. On the lower slopes there is dense underbrush and windfall to struggle through, and higher up snow

slopes and glaciers to cross, rock cliffs to climb and difficult aretes to traverse. On the summit the surveyor must work with an instrument set up on a pile of loose rock on the most exposed part of the peak, frequently suffering severely from cold and wind while doing so. These however are minor difficulties and not nearly so serious as those due to

FIGURE 6

variations of light and sudden changes of weather. The surveyor cannot wait indefinitely for a suitable light but must use his own judgment regarding exposure. This is a difficult matter when cloud shadows are heavy, particularly in a country where there is but little contrast. Even on a fine day, some views may require three to four times as much exposure as others. Often it is necessary to work rapidly in order to get through before an approaching storm breaks, or before clouds roll over the peaks and render further work impossible. Other causes of much trouble, particularly during the latter part of the season, are smoke from forest fires, dense haze and early snow storms. In these circumstances the surveyor must decide under what conditions he can work profitably and this depends very largely on the nature of the district. In Alpine country or where valleys are narrow, serviceable views may be obtained under very unfavorable circumstances, but in rolling country or where great distances are involved, objects soon lose their distinctiveness. Good photographs can be obtained only under favorable circumstances but much of a surveyor's success depends on his ability to get serviceable photographs under varying adverse conditions.

When in the field it is important to select those points which give the best views of the surrounding country. This does not mean that the highest peaks are always the best. In photographs taken from very high peaks the surrounding country often appears dwarfed and the detail does not show up so well as in those taken from a more moderate elevation. It must also be remembered that the higher the peak the longer the ascent will require, and the greater the likelihood of encountering sudden storms or floating clouds. Frequently very useful views may be quite easily obtained, from points of comparatively low altitude.

Cover Circuit of Horizon

It is customary to take enough views from each peak to cover the complete circuit of the horizon. This means

very little more work for the surveyor in the field and the extra views are often of assistance in the office. It seldom happens that all the views can be taken from a single point, and usually one or more camera stations are required on different parts of the peak. As a rule these stations may be located by reading angles on them from the main station and measuring the distance with a light tape. Angles must be read on at least one well defined point in each view, preferably on two. The angle of elevation or depression should also be read on each point as it may serve to check the horizon line of the view, if there should be any trouble in the office. It must be remembered constantly, throughout all field work, that the country to be mapped must be seen from at least two points which subtend angles great enough to give satisfactory intersections, and not too great to permit easy recognition of the same points as they appear in corresponding photographs, taken in pairs, one from each station.

For plotting purposes, bromide enlargements approximately 10 x 14 in. in size, are made from the negative. To obtain satisfactory results, the enlarging must be accurate, and uniformly done. This work is done by the Department at Ottawa with an enlarging camera constructed specially for the purpose.

In the office, the triangulation is plotted by ordinary methods depending on the nature of the control. This may vary from a precise triangulation to a reconnaissance survey where the triangulation and the photography are carried on at the same time. The elevations of the stations and more prominent peaks are computed from the angles read in the fields, the necessary corrections being made for curvature and refraction.

Views from different stations, showing the same country, are then selected. Sufficient points are identified on the corresponding views to show clearly the topography of the country. These points are plotted on the plan and their elevations calculated from the photographs. Using these points as a guide and with the photographs in front of him, the topographer is able to draw his contours with an accuracy dependent chiefly on the number of points plotted and the scale of his plan.

Figure 3 represents views from different stations shown as A and B on Figure 4. On these views points 1 to 6 have been identified to show the method used in plotting. The horizon and principal lines are ruled on the views in their proper positions as shown by the test views. The traces

FIGURE 7

of the principal lines and the picture planes are then laid down as shown in Figure 4. The lines from the stations A and B, to a and a' represent the principal lines of the views and b b' and b' b' represent their respective traces. The distances of the points identified from the principal line are then taken off on a slip of paper, using a separate slip

for each view. These slips c and c' are placed on the proper traces as shown in the illustration. The line of sight to any point is given by drawing a straight line from the station to the projection of the point as shown on the slip and the position of the point as given by the intersection of two or more of these lines of sight. Instead of drawing lines on the plan, it is customary to insert needles at the stations and to determine the intersections by means of fine threads or hairs attached to small weights. In Figure 4 these weights are represented by w , w , and the hairs shown at the point 6.

The geometric construction for laying down the traces is as follows:—

Let A and B , Figure 5, represent two known points either triangulation stations or points to which angles have been read by the transit. Produce the principal line VV to F making PF equal to the focal length. Find the projections a' and b' of a and b on the horizon line and measure the distances Fa' and Fb' .

In the second part of the diagram C represents on the plan the station from which the view is taken and A and B the two points. Draw lines from C through A and B and make CR and CQ equal to Fa' and Fb' respectively. With R and Q as centres and radii Pa' and Pb' respectively describe arcs of circles as shown. Draw CP' and join QR . Then P' is the projection of the principal point and QR is the trace of the picture plane. If there is any inaccuracy in the location of the stations or in the other work the two arcs will not be tangent to each other and the mean position will have to be used.

In order to facilitate the laying down of traces several methods have been devised. One of the best of these methods is due to R. D. McCaw of British Columbia. In this method a piece of celluloid is cut as shown in Figure 6 and two lines TT and FY drawn at right angles, PF being made approximately equal to the focal length. A small slot is cut at F and a scale ruled to cover variations in the focal length. The instrument is placed on the view and the distances of the points as a and b Figure 5 from the principal line marked on the line T with ink. The instrument is then transferred to the plan and using the proper focal length as shown by the scale it is rotated around C , until the points marked, which correspond to a' and b' , fall in Q and R . The position of the principal line is pricked through by means of the holes shown at O , P and Y and the position of the trace by means of those at T or in the case of a vertical view of those shown a little nearer the centre. The temporary marks are then cleaned off with a damp cloth. It will be readily seen that this method corresponds with the one given previously.

Determine Elevation of Points

The elevation of the points are determined by means of the instruments shown on Figure 7, which was originally devised by Messrs. D. B. Dowling and H. Matheson of the Canadian Geological Survey. The arms M and N are of brass fastened rigidly together. P and Q are sliding bars moving on the arm M . R is a swinging arm revolving around the centre of O ; P and R are made of transparent celluloid and on R a fine line rr is ruled radiating from the centre O . The arm Q carries a scale corresponding to the scale of the map. The instrument must be made accurately so that when the line rr is over the line s , the reading of the scale will be constant when moved along the arm M .

When using the instrument the centre O is placed over the station, and the arm P is placed so that the one edge coincides with the trace of the view, the line s falling on the principal line. The instrument is then held in place by heavy paper weights. The distances of the points above or below the horizon line as shown on the views is taken off on a slip of paper. The slip is placed on the arm P as shown in the diagram and held in position by the clips p . The scale is now set to read the elevation of the station when the line rr is above s . To obtain the elevation of the point 6, the arm Q is moved to the point plotted and the arm R moved so that rr passes through 6 as shown on the slip. The elevation of the point is now given by the

reading of the scale where it is intersected by rr . To avoid mistakes the elevation of each point is taken from two views and the mean of these two elevations is used.

Relatively level features such as swamps, lakes or rivers with comparatively small fall are plotted by means of squares. The perspective of a series of squares is laid down on the view and the projection on the proper scale, drawn on the plan. Then from the view the required features are drawn on the projection, square by square, as carefully as possible. It is necessary that the squares should be small enough to give good definition. In practice these squares are not ruled on the views but an instrument called the perspectometer is used instead. This consists of the perspective of a series of squares ruled on glass, having the distance line equal to the focal length of the photograph. It is customary to make the sides of the squares equal to one tenth of the difference in altitude between the station and the features to be mapped, though this may be varied to suit circumstances. The instrument is placed in its proper position on the view and the features drawn as before. The perspective of a set of squares is shown on the first view of Figure 3, and their projection, with the topography drawn in is shown in Figure 4.

Factors for Accurate Photographs

The accuracy of a photographic map depends first of all on the precision of the triangulation system controlling the survey. After that it is dependent on the number of camera stations and on the scale of the plan. Any scale or contour interval may be used. For general purposes the writer considers a contour interval of 100 ft. and a scale of 1:40,000 very convenient for a large plan. The precision is that of a good plane table survey but with the advantage that many more points are plotted and the contouring is done by the surveyor in the office, with views from different stations continually before him, while with a plane table this comparison is entirely wanting.

The most tedious and tiresome part of the work is plotting the points and drawing the contours. The office work requires at least twice as long as the field work. However, the time required for the field work which is the most expensive, is much less than if any other method of survey were employed and consequently delays due to adverse conditions are reduced to a minimum. The office work is carried on by a small staff and under favorable conditions, and is not so subject to unexpected interruptions.

A party of seven can work to good advantage under most circumstances. The party consists of the surveyor, his assistant and five men, two of them should be expert packers, if pack horses are used. With two sets of instruments, the surveyor and assistant surveyor, each accompanied by two men are free to work in different localities, the cook being left in charge of main camp at some central point. Except on long or dangerous trips one man is enough to accompany the surveyor when actually climbing. If in a country unusually difficult of access, extra help may be necessary, and even under ordinary circumstances an extra man is often an advantage.

With regard to the future of photographic surveying, it is probable that owing to the nature of the country to which it is applicable, the demand for work of this kind will always be rather limited. There are very large mountainous areas in Alberta and British Columbia which can be satisfactorily mapped in this way and other less broken areas, some partially timbered, which may be mapped by the camera alone or by the camera used in conjunction with other methods. While this class of country will not develop with a rush, as the prairie did a few years ago, its development will be gradual and there will be an increasing demand for topographic maps until ultimately it will all have to be surveyed. So far the work has been confined to government surveys of large areas on a small scale, but it is probable that as the method becomes better known, it may be found a rapid and accurate means of obtaining the topography of small broken sections on a large scale. Should such be the case, its field of usefulness would be greatly extended.

HYDRO-ELECTRIC POWER SITUATION AT ST. JOHN

Dependability of Supply Offered by New Brunswick Electric Power Commission Questioned by R. A. Ross & Co. in Report to City — Reply by Power Commission Engineers

ADVICE with respect to entering into a contract with the New Brunswick Electric Power Commission for the supply of power to the city of St. John, N.B., was recently sought by the city from R. A. Ross & Co., consulting engineers, Montreal. The report which has been received and published may, in the main, be characterized as adverse.

The present situation grows out of an effort that has been made to secure an arrangement with the commission more favorable than is now in force with the New Brunswick Power Co., the present distributors of power and light in St. John. In brief the offer of the commission is to furnish power at the city line for 1.2 cents per k.w.h. for the first four years and for 0.8 cent per k.w.h. thereafter, provided the city will agree to pay for a minimum of 10,000,000 k.w.h. It is planned to obtain this power from the Musquash development of the commission.

Ross Report in Brief

The outstanding features of the report of R. A. Ross & Co. are stated by Mr. Ross as follows:

(1) On the basis of the gauging records the power available at St. John during a year of minimum precipitation will be 17,000,000 k.w.h.

(2) As the gaugings show such extraordinary results when compared with the precipitation they cannot be accepted with safety.

(3) On the basis of the precipitation records, the power available at St. John during the year of minimum precipitation will be not in excess of 9,000,000 k.w.h.

(4) As the yearly operating and fixed charges which are a constant when divided by the k.w.h., the latter is indeterminate owing to the doubtful output.

(5) The requirements of the present customers of the company for light and power and street lights total 6,250,000 k.w.h.

(6) The total requirements of the company for 1920 totalled 12,113,490 k.w.h.

(7) The capital cost of a new distribution plant and steam standby station to cover light and power and street lighting is \$1,594,432.

(8) The cost per kilowatt hour to the customer from a new civic distribution plant covering all customers of the power company will be 7.99c. per k.w.h.

(9) The high cost of light at St. John as compared with Brantford, Hamilton, London, Windsor, is accounted for by the high cost of construction at present, and the necessity for a steam standby, but above all the restricted use per customer in St. John. On the same basis as above cities in these regards the cost per k.w.h. at St. John would be:

Basis of Brantford, 3.50c. per k.w.h.
Basis of Hamilton, 2.90c. per k.w.h.
Basis of London, 2.70c. per k.w.h.
Basis of Windsor, 3.50c. per k.w.h.
On report basis of St. John, 7.99c. per k.w.h.
Actual for 1920 basis of St. John, 8.55c. per k.w.h.

(10) The cost of power compared with Niagara is too high and the amount too restricted to permit obtaining loads common in Ontario, thus utilizing the distributing system for many hours per day instead of a few hours at night as at present, with consequent reduction in cost per k.w.h. for all services.

Musquash Development

The power to be supplied St. John is to be obtained from a development on the Musquash river covering both

east and west branches, the outstanding features of which are given in Table 1.

Table 1

	East Branch	West Branch	Total
Tributary drainage area in sq. mi.	72	76	148
Static head on wheels	95	117	Av. 102
Capacity of wheels k.v.a.	2-2900	1-2900	8700

Under the above 102-ft. head and with a generator efficiency averaging 90% and a wheel efficiency at 80%, which seems fair when considering the fact that on the St. John demands the load factor of the operating machines will be for many hours 33% or less, the number of cubic feet of water at the wheels necessary to generate one k.w.h. is 579 cu. ft.

The commission have in contemplation the supply of 21,000,000 k.w.h. at St. John. Assuming 10% loss in switching, transmission and transforming, the generated output at the Musquash would be 23,333,333 k.w.h. Total k.w.h. generated per square mile will, therefore, be 157,000. To supply the necessary wheel water for this amount of power would require a depth per square mile of run-off gathered at the wheels of 3.26 ft. or 39.12 in.

Stream Gaugings

In this district there are three contiguous drainage areas tributary to the Magaguadavic, Lepreau and Musquash rivers upon which gaugings have been made to determine the available flow. The general characteristics of these areas are as in Table 2.

TABLE 2

Run-off of Certain Streams in New Brunswick For Years Ending September 30.

		Magaguadavic	Lepreau	West Musquash
	Drainage area to gauge sq. mi.	574	90	76
1919	Mean run-off; second feet	1257	299	
	Run-off; second feet per sq. mi.	2.19	3.32	
	Run-off; depth in inches	29.78	45.30	
1920	Mean run-off; second feet	1442	309	
	Run-off; second feet per sq. mi.	2.51	3.43	
	Run-off; depth in inches	34.05	46.59	
1921	Mean run-off; second feet	1147	248	187
	Run-off; second feet per sq. mi.	2.00	2.75	2.46
	Run-off; depth in inches	27.18	37.55	33.60
	Average depth run-off for period, inches	30.3	43.1	

It will be noted that the West Musquash has only been gauged for a year and the East Musquash practically not at all. The item which attracts immediate attention in comparing these areas is the high run-off of 43.1 in. from Lepreau as compared with 30.3 in. on the Magaguadavic. When it is considered that these three areas are all subjected to the same climatic conditions including rain-fall, it is difficult to account for this difference even when allowance is made for the increased size of the Magaguadavic watershed and its reported different character. Further, it will be noted that even the Magaguadavic has a high run-off as compared with similar streams as will be shown later. It should be stated also that the records of Lepreau for the year 1919 only were used to design the Musquash plant for which no record then existed, and that the latter is now showing a considerable reduction on gaugings being taken.

In this and following tables it may be stated that all the figures of gaugings, etc., quoted, have been obtained from the Water Power Branch of the Dominion Government and are therefore authentic.

Precipitation Records

As the percentage run-offs indicated by gaugings in this district when compared with hundreds of others reasonably comparable and reliable has never been reached before,

the question of precipitation must be brought into the discussion.

It must be remembered that up to a few years ago, the only information engineers had as to stream run-off for use in the development of water powers, was obtained from the records of precipitation taken by the Dominion government at various stations throughout the country; and while it is recognized that accurate and seasoned gauge readings are more acceptable, under the extraordinary conditions shown in these gauging records, actually taken for only a short period, a comparison at least must be made between these two sources of information.

In Table 3 the precipitation records in the district for the years 1919-20-21 are given, from which it will be noted that those at St. John have been recorded for fifty-nine years; also that record is the highest in the district, and if applied to the drainage areas in question will undoubtedly allow a higher precipitation than the district actually received, those from the surrounding stations being less, and generally very much less. Further, this record being kept at the headquarters of the Meteorological Bureau for this district under the eye of the director, and for a period of fifty-nine years, may well be considered a model.

TABLE 3

Rainfall Records at Certain Places in New Brunswick for Years Ending September 30.
Depth in Inches

	Point St. John Lepreau	Sussex	Moncton	Fredericton Experimental Farm	Fred- erick- ton	
1919	51.44	49.76	37.77	40.10	35.82	41.79
1920	52.41	53.53	48.97	36.67	34.93	50.15
1921	35.28	37.87	31.42	26.84	29.41	33.73
Mean	39.73	47.47	38.78	34.99	37.01	43.03
Years in- cluded in mean	17	59	18	18	8	15

With the rainfall at St. John as a basis, the run-off gauging records compared with the rainfall records during the same year are shown for both Lepreau and Magaguadavic for a total of three years, and with the Musquash for one year only in Table 4.

The notable point in connection with this table is that under the same climatic and precipitation conditions the run-off of Lepreau is 42% higher than the Magaguadavic, all, of course, on the square mile basis. Further, Lepreau shows records up to 99% of the rainfall, a thing incredible, while the average over three years is 92%.

The records of the Magaguadavic on the other hand are more reasonable, although high, averaging 64%.

TABLE 4

Run-off Compared with Rainfall Precipitation
West Magagua-

	Lepreau	Musquash	davic	St. John
Mean run-off inches 1919	45.30		29.78	49.76
Mean run-off inches 1920	46.59		34.05	53.53
Mean run-off inches 1921	37.55	33.60	27.18	37.87
Total run-off 3 years	129.44		91.01	141.16
% Run-off to rainfall '19	91%		60%	
% Run-off to rainfall '20	87%		63%	
% Run-off to rainfall '21	99%	89%	71%	
Mean for 3 years gauging	92%		64%	47
Comparative % of run-off	142%		100%	

When these gauging records are compared with those from other streams on the Atlantic seaboard, although not in this country, reported upon by the U. S. Geological Survey, the contrast becomes startling. For the purpose of illustrating this, the records of eight streams as nearly as possible similar in area have been selected for comparison. These records as they have extended for a long period have been discussed by the engineering profession have become almost classics, and are accepted as correct. It will be noted the percentage of run-off in every case is very much lower

than the Magaguadavic, and tremendously lower than Lepreau.

TABLE 5
Mean Rainfall and Run-off Small Areas

Atlantic Drainage	Years	Area	Rain Ins.	Run-off	Runoff %
Croton	23	339	49.4	22.8	46
Cochituate	38	19	47.1	20.3	43
Sudbury	26	78	46.1	22.6	49
Mystic Lake	18	27	44.1	20	45
Neshaminy	16	140	47.6	23.1	50
Perkiomon	16	152	48.0	23.6	49
Tohickon	15	102	50.1	28.4	57
Pequanock	9	64	46.8	26.8	57
Magaguadavic	3	574	47	30.3	64
West Musquash	1	76	37.87	33.6	89
Lepreau	3	90	47	43.2	92

Under these conditions of wide discrepancy between gaugings of short duration and the old and seasoned record of rainfall at St. John, and by comparison with similar areas elsewhere, it is inevitable that for safety in prediction as to the power available one must return to the rainfall record.

The question upon which judgment must be used is as to the percentage of rainfall which may be expected to appear at the wheels in the way of run-off, especially realizing that this water is not in its free state, but is ponded, and therefore evaporation and seepage are inevitably high.

In Table 6 below, the percentage run-off at maximum is allowed at 66 2/3% of the rainfall of the year; the minimum 45%, and the average over fifty-nine years 55%.

In these allowances the fact is recognized that there will be more percentage run-off during a high precipitation year than during a low. As these percentages are higher than one would care to use for the purpose of predicting the amount of power available in advance of construction, especially when it is considered that all water in this case is to be stored, the results are considered to be such as to do to the power output no injustice but rather the reverse.

TABLE 6

Output on Basis of Rainfall Records at St. John for 59 Years	Maximum	Minimum	Mean
Based on Rainfall Alone	1886-87	1910-11	1861-1920
Extreme and mean rainfalls	58.51	36.70	47.47
Rainfall inches per year	66 2/3%	45%	55%
Allow % in run-off	39	16.5	26.1
Run-off in inches			

Power Available at St. John

In a previous page of this report it was shown that a depth of run-off of 39.12 in. was necessary to provide 21,000,000 kilowatt-hours at St. John, while gaugings on the West Musquash for 1921, indicate a run-off of 33.60 in., during which time the St. John precipitation records amounted to 37.876. This is not by any means the lowest rainfall record at St. John, that of 1910-11 being 36.70 in., from which, if we assume a proportioned run-off the lowest gauged record should give 32 in. of run-off.

The minimum power available at St. John during the year of lowest rainfall recorded at St. John would therefore be 21,000,000 k.w.h. multiplied by 32, and divided by 39 = 17,000,000 k.w.h. On the same basis, the other records in Table 6 show the following:

TABLE 7.

Power Available at St. John

	Run-off In.	Power at St. John k.w.h.
From gauging records, the lowest power available in 59 years	32	17,000,000
By precipitation readings maximum run-off (table 6)	39	21,000,000
By precipitation readings mean run-off (table 6)	26.1	14,000,000
By precipitation readings minimum run-off (table 6)	16.5	9,000,000

If the gauging records are right St. John may expect from the Musquash 17,000,000 k.w.h. during the minimum year. If these are not found to be correct and the precipitation records govern, it cannot be predicted that more than 9,000,000 k.w.h. will be available as a minimum. This will cover the present requirements at St. John for light, power and street lights in all totalling 6,250,000 k.w.h., but it will not cover the requirements of the company which include in addition those of the street railway, in all 12,000,000 k.w.h. in 1920.

Should it develop that the Musquash does not come up to the commission's expectations, or even if it does, a steam plant would be advisable to supplement the water power and enable the output of the project to be greatly increased over the minimum, so that new hydraulic plants when developed will not have to remain unloaded or only partially loaded for years after construction.

This steam plant, supplementing as it should the hydro-electric plant, should be owned and operated by the government so that they may carry out their own program of use of water and catch every flush as it comes, using the steam station to keep the pondage up during critical periods, and to carry the peaks of whatever service is demanded either from St. John or elsewhere. This question of a steam

average for the year, or \$8,922, has been used to determine the average operating costs.

Capital Cost of Distribution

Two methods of estimating the capital cost of distributing light, power and street lights are available.

An actual map layout with centres of distribution, loads, etc., marked, may be used, from which the number of transformers, meters, poles and weight of copper, etc., may be estimated. This is a long and expensive process, but fortunately there is a better one, as the results of actual practice are available.

A study of the records of the Hydro-Electric Power Commission of Ontario indicates that there are four cities, which may reasonably be used as a basis for estimating the capital cost for St. John—these being Brantford, Hamilton, London and Windsor, chosen by reason of similarity of customers and loads to those existing in St. John. It should be noted that for this purpose distance from the centre of generation has no bearing on the results which are limited entirely to local distribution costs within these cities covering land, buildings, appurtenances and street distribution as shown in Table 8 with the final figures obtained and used for St. John, inserted in 5th column.

TABLE 8
Capital Costs of Distributing Plant

	Brantford	Hamilton	London	Windsor	St. John
Population	32,159	108,143	59,100	31,629	60,000
Customers light and power	3,973	20,067	13,793	6,103	9,107
Capital cost light and power	274,262	1,190,867	1,022,894	315,836	887,932
Capital cost street	79,538	207,701	224,694	262,574	247,500
Capital cost total	353,820	1,398,568	1,247,588	578,410	1,135,432
Capital per Customer	69.00	59.00	78.00	52.00	65 + 50%
Operation and maintenance customer	5.75	5.90	7.00	6.70	6.33
K.W.H. per light customer	500	600	650	500	345

plant is dealt with fully in the second part of this report, and is there charged to the cost of distribution but should in justice be debited against the power purchased.

The serious part of this question relates to the cost per kilowatt-hour which has to be charged to someone. With an anticipated output of 21,000,000 k.w.h. which must, of course, be reckoned on the lowest year, unless a steam plant be provided, the cost can be met at the rate of 1.2 cents per k.w.h.

By whatever amount the sales fall below the above output, the cost per k.w.h. will increase in inverse proportion and must be paid by someone.

SECTION 2

Cost of Power to Customers

The question to be answered under this heading is as to the cost of light and power delivered to the customer on his premises in the city of St. John from energy purchased from the New Brunswick Electric Power Commission at their sub-station near the city at a cost of 0.8 cents per kilowatt-hour with a minimum of 10,000,000 kilowatt-hours to be paid for.

Power and Light Requirements

It is a very difficult thing to predict what the number of customers and their consumption per year is likely to be where no records exist. Fortunately in this case, we have the figures of the very admirable report of Mr. Kensit, supplemented by additional records of the company obtained since the issue of that report from which demands of the customer can be ascertained, and the power required to meet those demands at the commission's sub-station arrived at. The total of the company's station output for 1920 was 12,113,480 k.w.h., the total power demands for light, power and street lighting being 6,250,000 k.w.h.

Customers

The number of customers of the company for December, 1921, was 9,107, this being used for estimating the capital involved in supplying this number of customers, while the

The items of capital cost shown herein are obtained from the records of the Ontario Hydro-Electric Power Commission; the division between street lighting and light and power being arbitrary as regards several undivided items of the cost, but in every case they favor a low capital investment in the light and power distribution.

It will be noted that the capital investment per customer is not very different in the four cities considered, and that the average, which is \$65, has been used as a basis for estimating the capital cost of the distributing system for light and power only in the city of St. John.

Inasmuch as the capital invested in the distribution in those cities was made before the present rise in prices, an arbitrary percentage of fifty has been added in the case of St. John, to allow, in the first place, for the increase of cost during the last few years, and to, in some degree, anticipate the excess costs which will be incurred in St. John, owing to rock holes necessary for pole placements, and the difficulties which are inevitable in constructing power lines throughout the city, over, under or through the live wires of the company presumed to be a competitor.

In the same table will be found the operating and maintenance costs in these different municipalities, in which the bookkeeping is identical, and the results therefore directly comparable. Further figures at the end of the table indicate the average yearly demand per customer as compared with St. John's. It will be emphasized later that this lack of use is very largely the reason for the high cost in the latter.

From the above study, the capital costs of the entire undertaking are found. This, including the capital cost of distribution at \$65 per customer plus 50%, and for three miles of transmission line from the company's sub-station to the city, the whole making a total chargeable to light and power only of \$917,932.00.

In addition, the street lighting capital costs proportioned from the above four cities on the basis of ratios of heads of population is estimated with the same advance in their

price, and the cost of a steam station, details of which are given below.

It will, therefore, be seen that the capital investment necessary for the distribution of domestic and commercial light and power with street lighting up to and including the meters on private premises, will amount to \$1,594,432.00.

Steam Station

In the case of St. John depending as it will upon stored water from two small streams of limited capacity, a steam station is not only an insurance against breakdown, but a positive help in sustaining the output of the water power plant at a higher figure than the commission would dare to attempt if a steam plant were not in existence. It will also enable the city to accumulate a load in advance of the contemplated construction of the Lepreau plant, and thereby ensure a commercial return from that plant when completed. Otherwise, as the cost of the Lepreau must be charged to someone, the city will be involved at the start with a new plant which can only be loaded up gradually from increased demands in the city as they appear, the inevitable result being a very much higher cost for power to the city until the new plant is loaded.

From the point of view of insurance therefore against shut-down which would be fatal in the case of a city the size of St. John, as well as that of economics, a steam plant is desirable and in fact in your case absolutely necessary.

The capital cost of this steam plant is found to be \$429,000, the cost of equipment being obtained for this purpose from the makers of boilers and turbine plants. The operating costs are shown under two heads:

(1) A plant operating at full peak capacity with 30% load factor, \$169,000.

(2) Not operating but used as a standby only in case of trouble, \$38,900.

From this it will be seen that the additional standby cost per kilowatt-hour based on the present requirements of the city both for light and power and street lights, including fixed charges of \$42,900, is 1.64 cent per kilowatt-hour, and this must be added to the normal costs of distribution.

Cost of Distribution and Standby

In calculating the operating and fixed charges on the distributing system, advantage has been taken of the offer of the New Brunswick Electric Power Commission to reduce their rate for the first four years from 1.2 cent to 0.8 cent per kilowatt-hour, the city taking and paying for a minimum of 10,000,000 kilowatt-hours.

The cost per kilowatt-hour from these operating and fixed charges works out at 5.98 cents, this cost being obtained with the sale at customers' meters of the 4,200,000 kilowatt-hours shown by the meter records of the company for light and power sold, to which must be added the standby charge of 1.64 cents making a total of 7.62 cents.

Development Period

All of the above it will be noted is on the basis of a rate from the power commission of 0.8 cents on the supposition that the distributing plant when completed will be immediately loaded unopposed with the present customers of the company, and provides nothing for the growing years which will actually exist when business will be unremunerative, nor does it consider the increased price payable to the commission for power thereafter.

The commission under date of January 6 makes certain concessions from the original price of 1.2 cents, which in effect amounts to the remission of the sinking fund, replacement and renewals, and rental, during the three first years to be thereafter repaid except lapsed renewal funds after the business is established.

Mr. Ross estimates a loss on operation during the first four years of \$325,381 which compounded at 6% for three years amounts to \$367,000. This with interest and sinking fund imposes on the undertaking a yearly obligation of \$27,-

526. The total cost of power for the fifth year and after is thus estimated to be 7.99 cents per k.w.h.

Comparison of Light and Power Costs

A great deal of discussion has centered around the question of why the costs for light and power in the city of St. John should be so much greater than in certain municipalities in Ontario. It must be remembered that for this service the cost is pretty nearly a fixed one per customer no matter what power is taken so that when reduced to a kilowatt-hour basis the resulting figures of cost per kilowatt-hour depends on the consumption.

The consumption per customer in St. John is very much lower than in the four Ontario cities mentioned above, and the figures to follow indicate what would occur to costs in St. John were they on the same basis of consumption as in the four cities in question. If such were the case the costs would be as follows:

St. John — 345 k.w.h. per customer per year	5.07c.
Brantford — 500 k.w.h. per customer per year....	3.50c.
Hamilton — 600 k.w.h. per customer per year	2.90c.
London — 650 k.w.h. per customer per year	2.70c.
Windsor — 500 k.w.h. per customer per year	3.50c.

Comparison With Niagara

There has been much loose talk about the cost of power at Niagara and at St. John, and the statement has been made that if the power were given for nothing, the reduction in cost of light and power would be small—the latter statement being true only on the assumption that the consumption remains as at present.

At Niagara, the cost of generated power is \$12.00 per kilowatt-year, which is available to the purchaser for 8,760 hours, the average cost therefore being per kilowatt-hour 0.137 cent; the cost at St. John being 1.2 cents, is nine times as great. Figuring it in another way which comes to the same thing, the Musquash claims an output delivered at St. John of 21,000,000 k.w.h. This divided by 8,760 hours gives a total kilowatt capacity operated every hour in the year as 2,400 kilowatts. The base cost as per commission's figures being \$255,000.00 per year; the cost per kilowatt-year is therefore \$255,000.00 divided by 2,400 = \$106.00, as compared with \$12.00 at Niagara per kilowatt-year and the ratio is again of 1 to 9.

The situation at St. John it is emphasized again is governed by the small use that is made of the capital invested in plant. If the rates at Niagara were available at St. John, a large motor load could be obtained and the equipment provided used to its utmost capacity.

The city of St. John is in the same position as a railway with its right-of-way, tracks, stations, staff, etc. If the traffic is only one train per day the capital and fixed charges per train will be twice what they would be if there were two trains per day. In the case of light and power in St. John the bulk of the charges are fixed.

The distribution plant allowed for St. John must have a capacity sufficient for the peak load even if this only exists for one hour a night, whereas the same equipment would handle several times the amount of power distributed to motors at non-peak hours. Your power rates therefore, while they do not greatly affect the cost of electric power directly, do affect the general situation by which if motor loads could be got (which can only be done by a low rate for purchase power) the capital charges now entirely debited to light and small power would be divided in some proportion to use between customers for light and small power and manufacturing companies using large motors with long-hour consumption.

Reply of Commission

Following the publication of the Ross report, C. O. Foss, chief engineer of the New Brunswick Electric Power Commission, issued a statement in rebuttal, of which the more important portions are reproduced below. In this statement it is said that certain erroneous assumptions made in the Ross report have resulted in the estimate of power therein made being some 20% too low. Exception

is taken to the report more particularly in the matters of the estimate of power at the Musquash and the necessity for a steam standby.

According to the statement of Mr. Foss, Mr. Ross takes the lowest run-off records as gauged by the Dominion Water Power Branch, makes an error in the amount of head, in the efficiency factor of the generating unit, and guessing at the area of the drainage area computes the available power at 17,000,000 k.w.h. in the driest year on record.

In Table 1 of the Ross report it is stated that the static head on the east branch is 95 ft. and on the west branch 117 ft., or an average of 102 ft., whereas the average between 95 and 117 is 106. With this head of 102 ft. with a generator, efficiency of 90% and a wheel efficiency of 80%, "which seems fair when considering the fact that on the St. John demands the load factor of the operating machines will be for many hours 33% or less," the number of cubic feet of water at the wheels necessary to generate one k.w.h. is stated in the Ross report as 579 cu. ft. The static head, states Mr. Foss, is the difference in elevation between tail water and head water and could not in any case be used directly to compute power. The actual working head is less than the static head by the percentage of loss due to friction in racks, gates, pipes, etc. In this case, however, the Ross report quoted the figures of net working head supplied by the commission and erroneously called it static.

The generators have efficiencies guaranteed as follows: Full load 95%, three-quarter load 94.2%, one-half load 92.5%. They have been tested before shipment, under the inspection of the commission's engineers, and have exceeded their guarantee. The turbines have efficiencies guaranteed as follows: Full load 82.5%, three-quarter load 87%, one-half load 82%. Mr. Ross assumes that all three units will operate continuously and a great deal of the time below one-third load. The commission proposes to operate only one unit, or two units, or three units according to the load demand. This will enable it to operate no machine below three-quarter load except for brief periods and the overall efficiency will be 87% of 94.2% or about 82%. The commission estimates the power on 80% efficiency. The following shows how the engineers of the commission compute the available power:

The water powers branch of the Department of the Interior have gauged the water on the Lepreau, and have published complete daily reports of the rate of flow of this stream covering the period from April, 1916, to September 30, 1920. They have supplied the commission with the results from October 1, 1920, to September 30, 1921. From the figures for Lepreau the run-off of the Musquash streams can be very accurately estimated in the same proportion as the respective drainage areas: estimated from existing maps at ninety square miles for the Lepreau and seventy square miles for each branch of the Musquash. So that if the mean rate of flow of Lepreau for one year is 360 cu. ft. per second, the rate for each branch of the Musquash would be 280 cu. ft. per second for that same period. For the climatic year, October 1, 1920, to September 30, 1921, the mean discharge for the Lepreau was found to be 247 cu. ft. per second. For this same period a gauging station was maintained by the water powers branch on the west branch of the Musquash river and the actual mean run-off obtained was 190 cu. ft. per second. Seven-ninths of the measured mean flow of the Lepreau for this period is 192 cu. ft. per second, proving beyond doubt the reliability of the basis of comparison between the two streams.

On this basis the rate of run-off for each branch of the Musquash for three years is as follows:

1917-1918—317 cu. ft. per second
1918-1919—232 cu. ft. per second.
1919-1920—246 cu. ft. per second,

or for the whole period a mean flow of 265 cu. ft. per second for each branch. In estimating the available power a rate of 180 cu. ft. per second for each stream has been adopted.

The net working head at full load on the east branch after allowing for pipe line losses and tidal effect is 95 ft., and on the west 117 ft. Assuming 80% efficiency of gener-

ation, the west branch will develop 1,914 continuous h.p. and the east branch 1,550 continuous h.p., or the two combined will develop 3,464 h.p. throughout every second of the year, or at the rate of 2,585 kilowatts throughout the year. This equals over 22,850,000 k.w.h. per year at the generating station, from which it is estimated that 21,000,000 k.w.h. can be delivered at St. John after allowing for all transmission losses.

The apparent 20% discrepancy between the estimate of the commission's engineers and Mr. Ross is accounted for as follows:

Four per cent. due to error in averaging head.

Eleven per cent. due to low efficiency factor used by Mr. Ross, evidently because he had not familiarized himself with the layout of the plant.

Two per cent. excessive estimate of transmission losses.

Three per cent. to proportioning rainfall records and run-off between various years. Total, 20%.

Mr. Foss criticizes the Ross report with respect to the calculation of power from precipitation records and run-off estimates. He regards Mr. Ross as expecting the same percentage of run-off as obtains in streams through drainage areas that have a different soil formation, different slopes, different vegetable growth, and under various conditions of humidity. The nearest precipitation records are those of St. John over thirty miles from some points on the drainage area.

Referring to Table No. 3, Mr. Foss points out that in 1920 almost 50% more rainfall is recorded at Fredericton than at the Fredericton Experimental Farm, about four miles below Fredericton. On an average 17% more fell in Fredericton than at the Experimental Station. If rainfall varies from 17% to 50% over a distance of four miles in the level interior how much variation, asks Mr. Foss, might be possible between the gauging station on Douglass Avenue, St. John, and parts of the Musquash drainage area thirty-five miles away? It is less accurate to estimate run-off on these rivers from precipitation measured at St. John than from daily records of the actual run-off in the stream measured over a period of four years.

Mr. Foss disagrees with the Ross report as to the necessity of a steam standby plant. It is assumed that the Ross report comprehends a completely equipped steam electric generating plant, ready to be placed in operation at a moment's notice, with 40% of a full operating staff always on hand so that in case of breakdown to the hydro plant a partial supply of electricity would be available for at least the essential domestic and public services. If the chances of complete temporary breakdowns can be shown to warrant such a plant it would be an insurance and a costly insurance. No engineer after inspecting the Musquash layout would anticipate any ice trouble. The dual reliability of the Musquash, in reality the separate developments of two streams, has been repeatedly pointed out by engineers and the chance of any complete breakdown shown to be a minimum, certainly not to justify insurance to the amount of \$81,800 a year.

The Ross report states that as St. John will be depending upon two small streams with stored water a steam plant will be advisable. It is much better, in the view of the commission, to depend upon streams with storage than upon streams without, whether that storage be large natural lakes or lakes increased in capacity by the erection of dams. In fact in this country no continuous water power would be possible without storage. The Ontario Hydro-Electric Power Commission have in at least one case replaced a steam auxiliary by the erection of dams to provide additional water during dry periods. That is exactly what is being done at Musquash and will be done until the last storage site is used.

Rebuttal by Consulting Engineers

An exhaustive report in criticism of that of R. A. Ross & Co. has been made by C. H. and P. H. Mitchell, consulting engineers to the New Brunswick Electric Power Commission. This report supports the view of the chief engineer of the commission that sufficient water is available for the

generation of power to deliver 21,000,000 k.w.h. at St. John, and that a steam standby plant is not necessary as an auxiliary to the hydro-electric plant. The consulting engineers declare that the rates to consumers under the proposed plan can be made attractively low and such as to bear comparison with the rates obtaining in the Hydro-Electric Power System of Ontario.

Analysis by Herbert Phillips

In a series of addresses and in letters to the St. John Daily Telegraph, Herbert Phillips, managing director of the St. John Contracting & Building Co., Ltd., presented arguments to show that current for light and power taken together should cost consumers only 3.5 cents per k.w.h. after the fourth year, as compared with 7.99 cents arrived at by Mr. Ross. At present the average light customer pays about 12 cents per k.w.h., and the average power user about 6 cents per k.w.h. Mr. Phillips supports the view that there is adequate power at the Musquash and that no steam standby plant is needed.

MINERAL LAND SURVEYING

Reviewed by
E. W. Banting

Assistant Professor of Surveying, University of Toronto.

MINERAL LAND SURVEYING—By James Underhill, Ph.D., Mining Engineer, U. S. Mineral Surveyor for Colorado. Third Edition, Revised and Enlarged. New York: John Wiley & Sons, Inc. Cloth; 4¼ by 7 in.; pp. 237; illustrated; \$3.50 postpaid (21s. net).

This book might be of interest to provincial surveyors in Canada who are engaged in the survey of mineral claims, in so far as the methods followed in Colorado and the Western States would be of interest in comparison with our own methods.

The first two chapters deal with the methods used in obtaining the bearing of a course of a survey, first by the direct sun observation, and secondly with solar attachments. The most satisfactory way of obtaining the bearing of a course of a survey by Canadian surveyors would be by an observation on Polaris using astronomical field tables provided, on request, by the Surveyor General's Office at Ottawa. These tables are adapted for any time or place in Canada.

Chapters dealing with location surveys, patent surveys, patent field notes, land office records, and examination for commission as United States Mineral Land Surveyors complete the book. Examples of problems are given with their solution.

LAND DRAINAGE by W. L. Powers and T. A. H. Teeter. Published by John Wiley & Sons, Inc., New York. 270 pages; 5½ by 8¼ in.; 106 illustrations; cloth; \$2.75 postpaid.

BUILDING CONTRACTS, the Principles and Practice of their Administration, by Edwin J. Evans. Published by Chapman & Hall, Ltd., London. 304 pp.; 5¼ by 8¼ in.; cloth; price, \$2.50.

HYDRAULICS OF PIPE LINES by W. F. Durand, Ph.D., Professor of Mechanical Engineering, Stanford University, California. Published by the D. Van Nostrand Co., New York, 271 pp.; 134 illustrations; 5½ by 8¼ in.; cloth; \$4.50.

SEWERAGE AND SEWAGE TREATMENT by H. E. Babbitt, Assistant Professor of municipal and sanitary engineering, University of Illinois. Published by John

Wiley & Sons, Inc., New York. 531 pages; 6 by 9 in.; 186 figures; cloth; \$5 postpaid.

MATHEMATICS FOR ENGINEERS—Part 1, including elementary and higher algebra, mensuration and graphs, and plane trigonometry. By W. N. Rose, B.Sc. Published by Chapman & Hall, Ltd., London. Third edition; 54 pp.; illustrated; 5½ by 8¼ in.; cloth; \$2.75 postpaid.

MODERN TUNNELLING by David W. Brunton and John A. Davis. Published by John Wiley & Sons, Inc., New York, and Chapman & Hall, Ltd., London. Second edition, revised and enlarged, with new chapters on Railroad Tunnelling by J. Vipond Davies. 612 pp.; 6 by 9 ins.; 119 illustrations; cloth; \$6.50 postpaid.

ROAD MAKING MACHINERY—New Catalogue issued by Stroud & Co., Omaha, Neb.; 24 pages and cover; 7½ by 10½ in.; well illustrated; describing elevating graders, road maintainers, wheel scrapers, dump carts, truck bodies, road plows, dump wagons, blade graders, drag scrapers, bulldozers, snowplows, road drags, etc.

When the new pump at the Atwater Avenue station is completed, 30,000,000 gallons per day will be added to the water supply of the city of Montreal, giving a total capacity of 105,000,000 gallons per day from the different low-level stations. Three more pumps of 30,000,000 gallons capacity each will be installed at the low-level station, while a smaller pump of 15,000,000 will be removed to the high-level reservoir at McTavish street. The city's total pressure from the low-level will then be 180,000,000 gallons.

Letter to the Editor

HYDRATED LIME IN CONCRETE MIXTURES

Sir—1 notice in your issue of January 3, 1922, an article by Mr. Shertzer describing the advantages of using hydrated lime in concrete mixtures. In this he makes the following statement:

"Hydrated lime is the most efficient water-tightening medium available. The statement that it is the most efficient medium, has been made by the United States Bureau of Standards as the result of an exhaustive series of tests in which all of the available media were experimented with."

Mr. Shertzer, I believe, refers to a statement made in Technologic Paper No. 3 published in 1911, the title of which is "Tests of the Absorptive and Permeable Properties of Portland Cement Mortars and Concretes together with Tests of Damp-Proofing and Waterproofing Compounds and Materials," and occurs at the bottom of page 59. It refers to hydrated lime and reads as follows: "This is the most efficient medium employed and resulted in an almost impermeable mortar at the two-week test. Its value is probably due to its void-filling properties and the same results could be expected from any other finely ground inert material, such as sand, clay, etc."

It is not my purpose to argue the merits of hydrated lime but it seems to me in fairness to your readers who would naturally place great confidence in an opinion of the Beaura of Standards that they be aware of the use which has been made of this statement of the Bureau. When the full circumstances are known it is almost valueless as supporting evidence of the usefulness of hydrated lime in concrete and Mr. Shertzer's reference to it is misleading.

Yours truly,

RODERICK B. YOUNG,

Senior Assistant Laboratory Engineer,
Hydro-Electric Power Commission of Ontario.
Toronto, Ont., March 24, 1922.

UNCERTAINTIES RESPECTING WIND BRACING OF BUILDINGS

BUILDING codes, by reason of the necessity for simplicity and definiteness, make certain provisions with respect to the consideration of wind stresses in buildings that close analysis would perhaps not bear out closely. For example, it is stated in some codes that in buildings under one hundred feet in height the wind pressure may be disregarded, provided the height does not exceed four times the average width of the base. In others, these figures are replaced by the ten stories and three times the width of the base respectively. It is also occasionally provided that if the width of a building is at least two-thirds of the height, wind bracing may be omitted for buildings of any height. Just how closely these arbitrary assumptions represent the actual conditions it would be interesting to know.

Another matter of doubt is with respect to the effectiveness of exterior walls, partitions and riveted connections in resisting wind distortion. It is apparent that the efficacy of the walls would much depend upon the number and size of windows therein and that likewise the performance of the partitions would depend upon the openings through them. While each building is of necessity a special case, it would be of value to structural engineers if the efficiency of walls, partitions and connections could be stated in average cases. One instance of this being done is in the well-known monograph by Cyrus A. Melick on Stresses in Tall Buildings, wherein it is noted that the deflection of a seventeen-storey building is reduced by the walls, partitions and connections by only 40%. It would be of interest to know if in any characteristic cases the proportioning of

positive steel bracing members should be made on a basis of about 60% of the wind pressure, as indicated by Dr. Melick in the special case cited.

The extreme laboriousness of all exact solutions of wind stresses in tall buildings has made it necessary for purposes of practical design to use approximate methods. The fundamental assumptions lying back of these methods differ to a material extent on such matters, for example, as the distribution of shear across the columns in a given storey. While there are a number of comparatively simple methods that appear to give satisfactory results in practice, it is by no means certain that the best approximate method has yet been devised. There is in this, as in the matter of the effectiveness of the incidental bracing, a promising field for the investigator who has the time and facility at his command to undertake a careful enquiry into the whole problem of stresses in tall buildings.

MOTOR TRANSPORT ON THE INCREASE

PUBLICATION of the registration statistics for motor vehicles during the year 1921 shows that their use is still increasing at a rapid rate. In Ontario, there were registered during the year 1921, 200,900, as against 172,065 for the year 1920, or an increase of 16%. In Canada, the registrations for these two years were 460,674 and 402,929, respectively, or an increase during the year of 14%. For the United States, these numbers are respectively 10,325,000 and 9,211,295, showing an increase over the year 1920 of 12%. These figures are somewhat remarkable in view of the fact that many persons have predicted a falling off of the use of passenger cars at any rate. It would appear that such forecasts were ill-founded.

Astounding increase of motor transport is apparent on examination of the statistics for the past six years, 1915 to 1921. These show that the Ontario registration for all motor vehicles increased 374%, while for Canada the increase was 426%, and for the United States 322%. An important part of this is due to the use of motor trucks which is growing at a very rapid rate, approximately the same as that for motor cars except that the curve lags about eight years behind that for passenger cars.

In view of these facts, it appears that the problem of the highway engineer with respect to motor traffic is as much in the future as in the past.

OBITUARIES

IGNACE BILODEAU, a well known contractor of Quebec, died in that city on March 27, aged 81.

JOHN F. MacFARLAND, assistant superintendent of the overland department of the Ontario Hydro-Electric Commission, died last week.

CHRISTOPHER FOLEY, contractor, died in Vancouver, B.C., on March 22. Mr. Foley was born in Ontario 78 years ago and had lived in British Columbia 33 years.

J. WILSON GRAY, a well-known architect, died at his home in Toronto on March 28. Mr. Gray was born in Edinburgh, but had been in business in Toronto for 37 years, during which time he designed many public buildings.

PERSONALS

MARTIN MIKEL, of Kitchener, Ont., has been appointed road superintendent.

J. E. BANWELL, of Windsor, Ont., has been elected vice-president of the Ontario Municipal Electrical Association.

FRED C. BELL, engineer of Elgin County, has returned to St. Thomas, Ont., after a month's vacation in the South.

R. FRIZZEL, mining engineer, has returned to Edmonton, from a trip to the Arctic. Mr. Frizzel went north to inspect claims on behalf of an American syndicate who control mining properties in the Copper Mine River District.

A. F. A. COYNE, consulting engineer of Toronto, has been appointed director of instruction of the geology branch of the Petroleum Extension University of Port Wayne, Indiana. Mr. Coyne has spent a number of years investigating the possibilities of oil in Western Canada. He has lectured, among other places, at the Imperial College of Science and Technology, London, England.

HUBERT G. BROWN, who was recently appointed manager of the export department, British Empire Steel Corporation Ltd., was born in Nova Scotia, April 16, 1880, and educated in Amherst and Truro. His first position was

with the New York, New Haven & Hartford Railroad, in the mechanical engineering department, but he returned to Canada to enlist for service in the Boer War. Upon his return from Africa, Mr. Brown was in the engineering department of the Intercolonial Railway at Moncton for a short time, but soon rejoined the N.Y., N.H. & H. Railroad, and subsequently took a special course in mechanical engineering at Boston Technical College. His experiences abroad during the war convinced Mr. Brown

that there was a future in the export business in mechanical lines, and after he had finished his studies at Boston "Tech," he resigned from the railroad and entered the railway supply and export business in New York City. Later he joined the Pullman Company as manager for South America, with headquarters at Buenos Aires, and held this position for eight years, returning to the United States in the fall of 1919 to re-enter the export business as general agent for the Pullman Co., from which concern he resigned in December, 1921, in order to join the British Empire Steel Corporation.

CANADA WANTS WORLD CONGRESS ON GOOD ROADS

HAVING recently become a member of the International Association of Road Congresses, the Canadian Good Roads Association, through its executive, will exert a determined effort to secure for some Canadian city the fifth congress of that distinguished association, which is due to be held in 1925. Since the inception of the International Congress in 1909 only three conferences have been held owing to the intervention of the war. The first was held in Paris in 1909 and the second and third congresses were held before the war intervened and necessitated suspension of the work. It is only recently that the International Association has been able to resume its activities and to lay its plans for the fourth congress, which will be held in the Spanish city of Seville, probably in 1923. The date has not yet been fixed definitely because there remains much preliminary work to be done, but it is probable that it will be held within a year.

Meanwhile, however, the executive of the International

Association will hold a meeting, probably at the headquarters in Paris, in May or June of 1922, and it is to this meeting that any invitation for the succeeding or fifth congress should be addressed.

The Canadian Association proposes in the meantime to devote a considerable portion of its energies to placing itself and the Dominion of Canada in a position which will permit of an official invitation being extended for the fifth congress which, it is expected, will be held either in 1924 or 1925. The first step will be to convince the Canadian Government of the desirability of enrolling Canada as an "official adherent" of the International Association, a procedure which involves the granting of an annual subsidy of at least 1,000 francs, which entitles Canada to send one delegate to the congress, with a delegate for each additional 1,000 francs.

To bring the congress to Canada would necessarily mean also the assurance of a fund adequate for the providing of a suitable meeting place, for the general expenses attached to such a gathering, and for the suitable entertainment of the eminent engineers, Government officials and prominent laymen interested in good roads who would come as delegates from thirty countries, representing virtually the whole of allied and neutral civilization, none of the late enemy countries being at present members of the International Association.

It is considered that Canada has an exceptionally good opportunity to get the fifth congress. There exists among the delegates of the countries, who are members of the international association, a desire to visit the American continent and see something of the good roads progress that has been made here. Several matters, among which is the necessity for Congressional appropriations, preclude an invitation from the United States, so that Canada has the American field of favor to herself.

The governments of the following thirty countries have already given adhesion to the international association: Algeria, Argentina, Belgium, Chili, China, Cuba, Czechoslovakia, Denmark, France, Great Britain, Greece, Holland, British India, Dutch Indies, Italy, Japan, Luxembourg, Mexico, Monaco, Norway, Poland, Portugal, Roumania, Spain, Siam, Serbia, and Jugo-Slavia, Sweden, Switzerland, Tunis and Uruguay. The two latest of these subscribing nations are Czechoslovakia and China. Canada, it would seem, should not lag behind.

The executive of the Canadian Good Roads Association has already deputed several of its members as a delegation to wait upon the new Dominion Government to lay the matter before it and urge the necessary action to bring the fifth congress to Canada.

ONTARIO COUNTY ROAD MEN MEET

ROAD foremen, pathmasters and the Reeves and Councilors of the various municipalities in Ontario county met at Port Perry, Ont., on March 22 for a conference on road building. Sixty delegates were present. D. J. Kean, county road superintendent, presided over the gathering. Different types of road construction were discussed and local road conditions thoroughly investigated. The chief speaker was John MacVickar of the Provincial Department of Highways. Moving pictures were shown illustrating the gradual steps in the history of road building both in this country and in England.

Applications will be received until noon, April 6, by V. W. McFarlane, secretary-treasurer, Stonewall, Man., for the position of civil engineer for the municipality of Rockwood, Man. Duties are to commence May 1 unless by mutual agreement an earlier date can be set. Applicants are to state qualifications, experience and salary expected. All applications are to be in sealed envelopes marked, "Application for Engineer."

CONSTRUCTION NEWS SECTION

Readers will confer a great favor by sending in news items from time to time. We are particularly eager to get notes regarding engineering work in hand or proposed, contracts awarded, changes in staffs, etc.

TENDERS PENDING

The following tabulation is presented as a reminder to contractors in regard to tenders that are still pending, other than those reported in this issue. The word "Issue" refers to the issue of "Canadian Engineer" in which there appeared a notice giving details regarding the call for tenders.

Place of Work	Tenders Close	Issue
Stratford, Ont., construction of concrete base and combined concrete curb and gutter	Apr. 8	Mar. 28
Quebec, Province of, construction of waterbound macadam	Apr. 5	Mar. 21
Belwood, Ont., erection of steel bridge superstructure	Apr. 5	Mar. 21
Guelph, Ont., erection of Memorial Hall	Apr. 5	Mar. 28
Halifax, N.S., construction of roads	Apr. 6	Mar. 28
Toronto, Ont., bituminous concrete pavement	Apr. 7	Mar. 28
Fort Frances, Ont., alterations and additions to Public School	Apr. 7	Mar. 28
Halifax, N.S., construction of roads	Apr. 8	Mar. 28
Halifax, N.S., construction of roads	Apr. 10	Mar. 28
Chippawa, Ont., construction of concrete intake structure and ship channel in Niagara River	Apr. 10	Mar. 14
Ontario, Province of, widening and deepening the channel of the Welland River and a portion of the Queenston-Chippawa power canal	Apr. 10	Mar. 14
St. Catharines, Ont., construction of Collegiate Institute and Vocational School	Apr. 11	Mar. 21
Leamington, Ont., construction of pavement	Apr. 15	Mar. 28
Victoria, B.C., fabrication and erection of part of superstructure of Johnson St. bridge	Apr. 17	Mar. 21

BRIDGES, ROADS AND STREETS

Aurora, Ont.—Council has awarded contract for paving Wellington St. to the Warren Bituminous Paving Co., Toronto. Engineer, E. A. James, 36 Toronto St., Toronto.

Banff, Alta.—Dominion Government Department of Public Works plans to proceed at an early date with the completion of the Banff-Windermere Road.

Barton Tp., Ont.—Township Council plans construction of a sidewalk on the east side of Wentworth St., from the end of the present walk to Queensdale Ave. Brucevale Ave. will be re-metalled from Wellington to James St. Clerk, A. G. E. Bryant, Hamilton.

Birch Cliff, Ont.—Searboro Township Council plans to construct a concrete sidewalk on the north side of Kingston road, from Archibald Ave. to the city limits. Also a concrete sidewalk on the north side of Danforth Ave., from Victoria Park Ave. to Danforth road. Clerk, W. D. Annis, Searboro.

Brantford, Ont.—Tenders addressed to Ald. Wm. H. Ballantyne, Chairman, Board of Works, will be received until 12 o'clock noon, Thursday, April 13, for the city's supply of road oil, asphalt, Portland cement and castings for 1922. City Engineer, F. P. Adams.

Bridgeburg, Ont.—William German, M.P., for Welland County, of the firm of German & Brooks, announced that he will immediately introduce a bill at Ottawa in connection with the proposed bridge to be built over the Niagara by private capital.

British Columbia, Province of.—Tenders endorsed "Tender for Construction Trans-Provincial, Project 23, Sections G. & K." will be received by the Hon. Minister of Public Works, Victoria, until noon, Monday, April 10, for the construction of 19 miles of the above road. Plans and specifications may be seen at the District Engineer's Office, Court House, Vancouver; at the Court House, Rossland; at the office of the District Engineer, Penticton; and at the office of P. Philip, Public Works Engineer, Department of Public Works, Victoria.

Burlington, Ont.—Town Council decided to have plans and specifications prepared for a concrete road on Brant St., from Water St. to Caroline St., and an 18-ft. strip from Caroline St. to the middle road.

Chatham, Ont.—Kent County Council's road program for this year calls for an expenditure of \$612,150.

Chatham, Ont.—The city will probably pave this year Cornhill St., Water St., Ursuline Ave., Lowe St. Sidewalks are contemplated on Third St., Richmond St., Gladstone Ave., and sewers on Poplar St. and Park Ave. Considerable sewer work was carried on during the winter under provincial and federal aid to relieve unemployment. City Engineer C. H. R. Fuller.

Chatham, Ont.—Kent County Council recently heard a deputation from the City of Chatham which sought county co-operation in a plan to have the provincial highway scheme for the current year extended. The particular request was that the Government be urged to complete the pavement of the Longwoods Road from Chatham as far as Louisville, the road to be gravelled from that point to Kent Bridge.

Cornwall, Ont.—Tenders for the grading and construction of about half a mile of pavement on Pitt St., will be received by J. G. Harkness, town clerk, until 12 o'clock noon, Saturday, April 8.

Ford City, Ont.—Town Council endorsed the request of the Suburban Area Commission that Pillette road be paved within three years, from the Grand Trunk tracks to Tecumseh road. Estimated cost, \$16,270.

Halifax, N.S.—Tenders, addressed to the Provincial Highways Board, will be received until noon, April 12, 15 and 18 for highway construction. (See official adv.)

Halifax, N.S.—Tenders, addressed to the Provincial Highways Board, Halifax, will be received until noon, April 19, for surfacing with gravel ten miles of the Truro-Glace Bay Road.

Hamilton, Ont.—The widening of Catharine St., to provide a better site for the new building of the local Hydro Commission, was approved by the City Council, but was referred back to the Board of Control for further consideration. Estimated total cost, \$42,078.43.

Kingsville, Ont.—Alternative tenders will be received by W. G. Long, town clerk, until 12 o'clock noon, Monday, April 17, for labor and materials necessary for the construction of reinforced concrete, base and stone filled asphalt, or base and bitulithic asphalt, together with necessary excavating, curbing, etc. Approximate area, 40,000 sq. yds. Plans and specifications are on file at the town clerk's office, and at the office of Code & Code, civil engineers, Windsor.

Kitchener, Ont.—Tenders will be received until noon, Monday, April 10, by Samuel Cassel, Clerk of Waterloo

County, Court House, Kitchener, for the following: Approximately 18,773 sq. yds. concrete pavement in Township of Woolwich; approximately 4,689 sq. yds. concrete pavement between Preston and Hespeler; approximately 622 sq. yds. concrete pavement in village of West Montrose; approximately 1,778 sq. yds. concrete pavement north of Town of Waterloo; approximately 1,030 sq. yds. concrete pavement in the Village of Bridgeport; and retaining walls at Bridgeport. Specifications may be seen at the County Clerk's office. Further information from L. S. Lichty, County Road Supt., Wellesley, Ont.

London, Ont.—Middlesex County Council plans to spend \$200,000 on roads this year. Engineer, Charles Talbot, London.

London, Ont.—Work will be proceeded with immediately by the G.T.R. on new approaches and abutments at Hutton's bridge in London Township.

Minotia, Man.—Municipality has sold a bond issue amounting to \$86,000 for road purposes. Clerk, W. E. Warren.

Montreal, Que.—Executive committee of City Council submitted a report to Council asking for approval of the plans for rebuilding the Ontario St. subway at a cost of \$250,000.

Niagara Falls, Ont.—The Niagara Bridge Co., owners of the cantilever bridge here which crosses the Niagara River near the lower bridge, announced that a new bridge will be built this year.

Niagara Falls, Ont.—Hydro-Electric Power Commission of Ontario are reported to have let contract for erection of bridge across Lundy's Lane to the Hamilton Bridge Co., of Hamilton. It is said the bridge will be of steel construction and is estimated to cost \$60,000.

Ottawa, Ont.—Carelton County Council passed by-law providing for the widening of the Metcalfe road.

Ottawa, Ont.—Tenders will be received at the office of the Suburban Roads Commission until 11:30 a.m., Thursday, April 6, for the construction of approximately 3½ miles of asphaltic concrete surface. Plans and specifications may be seen at the office of the Commission, 26 Wellington St.
